Greek entertainments involved the adoration of beauty, the edification of the mind, and the flourishing of culture to illustrate the greatness of being Greek. Theater, music, and art not only entertained Greek citizens but also allowed them to enjoy the fruits of Greek culture. Greek theater, typically Athenian theater, allowed epic tales, moral stories, and political satire, to be enjoyed by all. Music gave the soldier, the tradesman, or the politician the ability to take the time to blow off some steam and enjoy himself through playing an instrument. Arts gave the artist the ability to sculpt something that brought praise and glory to his city-state or deity and that his fellow citizens could enjoy and take pride in. Greeks partook of these venues and forms in their leisure time, pursuing activities and recreations that edified them and that they could justifiably take pride in. The great monuments of the Hellenistic world attest to the attitudes inherited from Classical Greek civilizations.

Roman perceptions of leisure are far more bleak and negative than that of their predeces-

➤ ROMAN BATHS

The Roman bath in the late republic and early empire was a place to transact business, discuss matters of state, and partake in the relaxation that it offered to patricians and plebeians. Roman elites frequented baths as a venue from which to simultaneously conduct issues of business while taking a refreshing bath. Politicians, ranging from senators to prefects, also went to baths to carry on their duties. Tradesmen, merchants, and scholars also enjoyed their leisure time in the refreshing and social atmosphere of the baths. The Roman baths included people from all social classes and backgrounds and served as a center for the community at large to congregate in a common activity. Equipped with facilities to encompass substantial amounts of people and with both hot and cold water readily accessible and piped in directly, Roman baths were also a rather modern convenience in antiquity.

However, Roman baths were perceived as places of vice and immorality. Heavily criticized for the prevalent illicit prostitution trade and widespread homosexual activity, the baths became notorious for contributing to the decay of Roman society in the minds of moralists. The presence of prostitutes, pederasts, and homosexuals shocked Romans into perceiving baths as the representation of all that was wrong with Roman society. However prevalent that perception, baths remained popular places for average Romans to take a refreshing dip and talk business.

—Abraham O. Mendoza

sors. While Romans did partake in entertainments in their leisure time, leisure itself was seen as the disruption of productive activity, something to be avoided at all costs. The perception of leisure as an opportunity for *otium*, or idleness that allowed the individual to seek corruption, vice, and immoral activity, was shunned by Roman moralists. Extreme productivity in all walks of life was the norm, to be attained and practiced by everyone. A life of leisure was an immoral life. This position, usually advocated by Roman elites, posed a huge contradiction to the perception they had of work. Roman elites, such as Cicero and Cato, viewed work as something that sullied a man, typically lower-class men,

who exchanged their work for currency like prostitutes. Men of their stature could engage themselves only in pursuing productive lives as politicians serving the good of the state or men of letters pursuing intellectual interests while enjoying the benefits of the wealth of the landed estates. While the perception of leisure during the republic and the early empire (principate) disparaged both work and leisure, recreations and entertainments were readily available to people of all classes. However, *otium* was always blamed for the perceived cultural and political decline of Rome, weakening Roman citizens who were partaking in the pleasures of the flesh.

Roman leisure, enjoyed by both patricians and plebeians, took the form of various entertainments available to the ancient Romans. Feasts, festivals, and games allowed Romans to come together to enjoy food, community, and entertainment. Art, music, and literature allowed them to enjoy the bounty of Roman culture. However, decadent recreations such as brothels, gambling, and recreational sexual activities in baths were also prevalent in Roman society. Some Roman emperors who sought a life of luxury and decadence in supposed immoral activities were subsequently demonized by their moralistic peers as encouraging the moral detriment of the people and thus the decay of the Roman state.

Development of the Greek Novel

By the first century BCE a new type of prose literature, commonly referred to as the Greek novel, had developed in the Greek-speaking eastern part of the Roman empire. These works were generally romances, written in Greek, of which only five extant texts survive: Chariton's

Chaereas and Callirhoe (ca. first century BCE to second century CE), Xenophon's *Ephesiaca* (second century CE, no earlier than 116), Achilles Tatius's *Leucippe and Clitophon* (second century CE), Longus's *Daphnis and Chloë* (mid- to late second century CE), and Heliodorus's *Aethiopica* (third or fourth century CE). Most of the scholarship centers on the debates about the intended audience and whether a nineteenth-century literary term should be applied to ancient texts.

Some of the authors were Roman citizens, though they wrote in Greek. Their formulaic novels featured a basic plot in which lovers meet, are separated, undergo a series of adventures, and are eventually reunited. Papyri fragments of other texts, however, show variation from this pattern. Originally akin to historical novels, later texts utilized more mythic content. These stories grew out of oral tradition, as people drew a distinction between true tales and intentionally false ones.

Contemporaries dismissed the Greek novel as substandard literature because the stories were false and generally poorly written. Close study of the texts has led scholars to rethink original assumptions about the intended audience, once thought to be middle- and upper-class women because modern romance novels are written for such readers. The ancient authors use the Greek plural masculine for their audience, indicating that the readers were a mixture of men and women, if not all male, and suggesting that the texts were read aloud. The audience therefore was roughly the same as for any other literary genre.

The Greek novel impacted many other genres, including romance, the epistolary novel, biography, hagiography, Christian writings, and Jewish novellas. The ancient Greek novel also inspired the twelfth-century Byzantine novels.

➤ DAPHNIS AND CHLOE

The story depicted in *Daphnis and Chloe* is attributed to Longus, who is thought to have lived on the Greek island of Lesbos in the second century CE. *Daphnis and Chloe* is a classic example of the early Greek novel, containing all of the hallmarks of the ancient romance story. A man and woman meet, fall in love, are separated for one reason or another, and then are finally reunited.

The story begins with the discovery of an infant boy (Daphnis) who has been exposed to the elements and left to die by his parents. The goatherd who discovers Daphnis raises him as his own son. Similarly, a shepherd discovers an infant girl (Chloe) who was also left out by her parents to die. The story progresses, with the two children growing up together and falling in love with one another. They are confused by these emotions and even with the guidance of others and are unable to

figure out how to consummate their love. Eventually Daphnis is educated in the arts of love by a woman from the city, but he chooses not to pursue Chloe sexually for fear that she may be physically hurt by the act. From this point forward, Daphnis and Chloe are separated from one another. Chloe is pursued by various suitors and at one point is saved from kidnappers by the god Pan. Daphnis, among other misfortunes, is abducted by pirates. After a series of misadventures Chloe is depressed, thinking that Daphnis has forsaken her, and while in this state she is kidnapped again. Daphnis returns and rescues her, and the two decide to get married. The story ends with a wedding (in which Daphnis and Chloe are recognized by their parents), and their love is finally consummated in the bridal chamber.

—Kevin M. McGeough

Entertainment in the Greek and Roman World

Entertainment in both ancient Greece and Rome consisted of a variety of forms and venues inclusive of most all elements of society. Some entertainments were relegated to particular strata of ancient society, particularly elites. However, popular entertainments geared toward all of society typically were more widespread. Greek entertainments were characterized by imbuing the citizenry with civic pride and displaying the best attributes of Hellenic culture. Roman entertainments, particularly those within the city of Rome, were illustrative of the resources available to the emperors and the patrician classes to present gigantic spectacles to appease the masses on whose votes and support they counted on. Both ancient Greek and Roman entertainments sought to create a sense of communal cohesion among their respective citizens. Greeks desired to imbue themselves with civic virtue and pride when enjoying their entertainments. Romans wished to regard their entertainments as a way to display the greatness and power of Rome in addition to sating the bloodlust of the masses.

Ancient Greek entertainments consisted of athletic competitions, theater performances, musical events, and religious festivals. Among the most famous of Greek sporting events are the Olympics, held every four years in Olympia and consisting of a variety of events framed to show the physical prowess and beauty of the athletes. They were also opportunities for the Greek city-states to display their very best athletes to the rest of the Hellenic world in all their glory, in essence displaying their superiority in military prowess and strength. So important were the Olympics to the Greeks that a sacred truce (*ekecheiria*) remained in effect through the games between all the city-states. Ancient Greek theater, in the form of dramas, tragedies, and comedies, graced the stages of antiquity. Playwrights, such as Sophocles (fifth century BCE) and Menander (342–293 BCE), composed pieces imbued with biting satire, political commentary, and the everyday trials of humanity in a venue that most Greeks were capable of grasping. Musical events attracted much attention in the Greek world, attracting the sponsorship and active participation of elites. Religious festivals, involving processions, music, and much revelry in addition to large community feasts, were held

Detail from a Roman mosaic of circus scenes shows leopards fighting. (Scala/Ministero per i Beni e le Attività culturali/Art Resource, NY)

on religious days in commemoration of the Olympian deities.

Roman entertainments are renowned for their gigantic displays of military processions, gladiatorial games, chariot races, animal exhibitions, and festivals. Roman emperors, politicians, and patricians subsidized these massive spectacles for the masses to assure their support and propagate their own popularity. Imperial acquisitions and military victories were typically followed by a huge procession in commemoration of the victor. Large feasts accessible to all Roman citizens provided massive amounts of food and drink and were accompanied by raucous celebration and revelry. Gladiatorial combat was widely popular in Roman society, consisting of hand-to-hand combat between well-trained warriors, typically slaves, against similar warriors, convicts, prisoners of war, or animals. Huge animal fights would typically accompany these gladiatorial matches, pitting lions against bulls, bears, or groups of people. Massive groups of armed gladiators would sometimes also take part in mock battles, resulting in multiple deaths in one day. Among the most popular of Roman entertainments are the chariot races. These races typically pitted two racing factions, the Reds and the Whites, against each other. Chariot races attracted much attention from societal elites, who heavily subsidized the sport. The driver would have to drive various laps around the track, with only a lash and a knife (to cut the harnesses in case of a crash), and skillfully outmaneuver the competition to win successfully.

The Greek and Roman Theater

Costumed performances are known from many cultures, but it was in classical Athens that true tragedy and comedy emerged. The first formal tragedies, in which an actor engaged in dialogue with a chorus, were evidently produced by a man named Thespis in the 530s or 520s BCE. None of Thespis's plays survive, and scholars are uncertain about the circumstances of his production and the ritual or poetic precedents for it.

The fifth century BCE witnessed an explosion of theatrical creativity in Athens. Enough plays by Aeschylus, Sophocles, and Euripides survive to give us some sense of these playwrights' contributions to the genre. Although tragedies were produced in groups of three (trilogies) at the festivals of Dionysus, most of the ones that we now have survive as individual dramas (the exception is Aeschylus's complete *Oresteia* trilogy). Tragedies were almost exclusively about the mythical cycles of the Greek gods and heroes, including myths about Thebes (Antigone and Oedipus), Athens (Theseus), and above all the Trojan War. The only surviving exception is Aeschylus's *Persians*, which was about the war with Persia in the early fifth century BCE. Only men were allowed to be actors.

The seven surviving tragedies attributed to Aeschylus (ca. 525–456 BCE) reveal a playwright fascinated with the workings of vengeance and justice between gods and human beings. These themes are on display especially in the *Oresteia*, which is about Clytemnestra's murder of her husband Agamemnon on his return from the Trojan War and the way his son Orestes murdered his mother in retaliation.

Sophocles (ca. 490–406 BCE) is probably best known for *Oedipus the King* in which Oedipus discovers that he has killed his father and married his mother. Tragic irony—in which the protagonist is unaware of the significance of his actions—is especially characteristic of Sopho-

THE THEATER OF DIONYSUS AT ATHENS

Drama was born in Athenian festivals dedicated to Dionysus. The festivals, such as the Rural Dionysia, Lenaea, and City Dionysia, only occurred once a year and entailed a number of rituals, but productions of comedies and tragedies were the culminating events. At first, in the sixth century BCE, dramatic performances seem to have been conducted in the agora, the public square in Athens, where temporary wooden seating was installed for the spectators. It was said, however, that on one occasion the seating stands collapsed, and the Athenians decided to build a permanent stone seating area against the side of the hill of the Acropolis.

This theater became a model for the future development of all theaters in ancient Greece. The seating area could accommodate some 14,000 people in the fifth century. Spectators faced an orchestra, an area in which the chorus would dance. A fourth-century BCE renovation left the orchestra in a circular shape, but it is not at all clear that this was the shape in the fifth century. Beyond the orchestra was the stage on which actors performed their parts, and it was backed by a stage building, the *skene*. The *skene* might serve as a palace facade. Occasionally, stage action might call for a god to appear on the roof or even

Theater of Dionysus, at the base of the Acropolis, was built during the fourth century BCE. The amphitheater was the site of the annual Athenian festival in honor of the god Dionysus, and was the venue for performances of works by notable playwrights Aristophanes, Euripides, Sophocles, and Aeschylus. (Chris Brown)

to fly down onto the stage; this could be accomplished with a *mechane*.

The Roman adaptation dispensed with the orchestra and chorus, and they often built impressive stage buildings, sometimes composed of two or three stories.

—Kenneth Rothwell

cles. In the *Antigone*, similarly, Creon realizes too late what he has done by sentencing Antigone to death.

Toward the end of the fifth century, Athens and Sparta found themselves locked in the grueling 27-year-long Peloponnesian War. The war ushered in a period of pessimism and caused many Greeks to reconsider their social and religious values. This darker, more skeptical view is reflected in many of the tragedies of Euripides (ca. 480–407 BCE). In the *Medea*, although spectators are horrified that Medea would kill her own children, we are also brought to see that her complaint against Jason was fully justified. Euripides does not necessarily display the nobler side of humanity.

Also produced during the Peloponnesian War were the comedies of Aristophanes. Comedy had been introduced to the festivals earlier

in the fifth century BCE, and we know relatively little about the first generation or two of comic playwrights, but Aristophanes frequently focuses on a vigorous central protagonist who finds ways to impose his or her will on the world. Whether these characters' ways obey the laws of the state or even of nature is secondary. In the *Clouds* of 423 BCE, an Athenian citizen named Strepsiades tries to get training from Socrates in sophistic rhetoric so that he can outwit his creditors, but it all goes wrong when Strepsiades' son turns out to be the better student and tries to outwit his father. Strepsiades' solution was to burn down Socrates' schoolhouse.

Aristophanic comedy focused heavily on social and political satire at the expense of sophisticated plots and subtle characterizations. By the late fourth century BCE, however, comic poets were writing carefully plotted comedies with

deeper insight into psychology and human relationships. This came to be known as New Comedy, thus distinguished from fifth-century Old Comedy, and is best represented by Menander of Athens (344–292 BCE). Only one comedy has survived in its entirety, the *Dyskolos* (*Grouch*). The plot revolves around a young man who has fallen in love with a girl and must overcome the objections and resistance of her father if he is to marry her.

New Comedy is better known from Rome, where the Latin comedies of Plautus and Terence were performed in the late third century BCE and early second century BCE. Their plots also entailed love between a young man and woman, but the interest is often drawn elsewhere. Plautus, for example, perhaps devised and certainly exploited the character of the wise-cracking and inventive *servus callidus* (“tricky slave”). In the *Miles Gloriosus* (*Braggart Soldier*) it is the slave, Palaestrio, who helps a young man’s girlfriend escape a military officer. Terence followed this tradition, although his six comedies are more literary and refined than the episodic and boisterous Plautus.

All that has survived of Roman tragedy are six works written by (apparently) Seneca in the first century CE. Most of these dramas revived stories of Greek mythology, but they missed no opportunity for bloodshed. Seneca wrote a version of *Medea* in which he portrayed the title character as being more passionate than Euripides’ *Medea*. The speeches assigned to characters in Senecan tragedy are marked by the rhetorical tradition of the empire.

Classical drama has had a profound influence on European theater since the Renaissance. Although the plays of Terence continued to be read by schoolboys in the Middle Ages, the rediscovery of Plautus’s comedies in the fifteenth century revitalized the genre. As Greek tragedy became better known in the sixteenth and seventeenth centuries, it too became a touchstone.

Gladiators

Although the origins of gladiatorial combat have been debated in the past, the current scholarly consensus is that it originated in Campania (southern Italy). The fact that, for example, the earliest stone amphitheaters as well as the most prominent gladiatorial schools in Italy emerged in Campanian centers such as Capua supports a proposed Campanian origin for gladiatorial games.

The first recorded combat of Roman gladiators was staged in a funerary context. In 264 BCE the sons of Junius Brutus Pera staged a combat among three pairs of gladiators in honor of their recently deceased father. The purpose of such early gladiatorial exhibitions was evidently to honor the deceased through the spilling of human blood as well as to illustrate his importance to the community through the provision of such a lavish sacrifice. Over the next few centuries the performance of such a *munus* (obligation) became an ever-more important aspect of aristocratic funerals in Rome, and the scale of such contests increased accordingly. Titus Flamininus, for example, enlisted 74 gladiators to fight at his father’s funeral in 174 BCE.

By the late Roman republic, gladiatorial exhibitions were used as a means of gathering political support by ambitious aristocrats, who would commonly stage these events for members of the public in hopes of gaining their votes in an upcoming election. A common practice during this period was for *aediles*, the magistrates responsible for the staging of public games (*ludi*) in Rome, to provide additional gladiatorial games at their own expense so as to (hopefully) facilitate their subsequent election to one of the higher magistracies, such as the consulship. Gladiatorial contests were still ostensibly being staged at this time in the name of a deceased relative. The fact, however, that those staging such events could delay them, or attempt to delay

them, until a more auspicious occasion in terms of their political ambitions had arisen indicates that the original purpose of gladiatorial spectacles by this time was being overshadowed by their political usage. Julius Caesar, for example, staged a display of gladiators in honor of his deceased daughter Julia as part of the lavish public entertainments that he put on for the Roman populace in 45 BCE despite the fact that she had been dead for almost a decade at that point in time.

The first Roman emperor, Augustus, in an effort to consolidate his authority and curb the rise of potential political rivals, took steps to ensure that such a potent means of currying popular favor would henceforth be firmly under imperial control. Magistrates and wealthy citizens outside of Rome continued to stage gladiatorial spectacles on occasion, but the most lavish events, those staged in Rome itself, were subject to imperial discretion. Early in his reign, for example, Augustus placed limitations on both the number of gladiatorial displays that could be staged by Roman magistrates each year as well as the number of gladiators involved in these displays. Imperial control increased over time until by the reign of Domitian, in the late first century CE, only the emperor or an official or relative acting on his behalf could legally produce gladiatorial spectacles in Rome. The lavish gladiatorial spectacles staged by Augustus and his successors to ingratiate themselves with the Roman populace certainly surpassed any event that could be found outside the capital. In his autobiography *Res Gestae*, for example, Augustus claims that 10,000 gladiators participated in the eight spectacles that he staged on his own or his relatives' behalf during his reign.

As such events grew in scale and spread throughout Roman territory under the late republic and empire, the infrastructure associated with gladiatorial spectacles increased as well. Even before the Roman empire, a number of *ludi* (training schools) were established in Italy to meet the ever-growing demand for gladiators. The most famous of these early *ludi* was located in Capua. It was here in 73 BCE that Spartacus and his fellow gladiatorial trainees began their famous revolt against Rome. Not surprisingly, the most elaborate training facilities were lo-

Gladiator fight, mosaic from a Roman villa in Nennig, Germany, second century CE. (Jupiterimages)

cated in Rome itself. Four *ludi*, most notably the *Ludus Magnus* (Great School), were established for the training of gladiators as well as wild-beast fighters (*venatores*) in the heart of the city.

The gladiators trained at such venues as the *Ludus Magnus* were not all uniformly equipped but instead used a variety of weapons and armor. Perhaps the two most famous categories of gladiator were the *secutores* (followers) and *retiarii* (net-fighters), who were often pitted against one another. The *retiarius* was armed with a net and trident but had only a belt, a loin-cloth, and covering on the left arm (*manica*) for protection. He relied instead on his speed, hoping to incapacitate a more heavily armed opponent with his net before the latter could come to close quarters. The *secutor*, by contrast, fought with a sword and was typically protected by a shield, a helmet, and greaves. Although he could not move as quickly as a *retiarius*, he relied on his armor to protect him while he advanced upon his foe. The different weapons and armor employed by the other categories of gladiator are not always clear, and it may be that the equipment used by different types was less standardized than has been assumed by some scholars in the past.

► BEAST HUNTS

A popular spectator event in ancient Rome was the *venatio*, a staged combat involving wild animals. Originally, such events consisted of displays of elephants captured after victories over Pyrrhus and the Carthaginians in the third century BCE, but by the next century, perhaps because of the popularity of contemporary violent gladiatorial events, these processions of exotic animals were evidently no longer entertaining enough for Roman spectators. In 187 BCE Marcus Fulvius Nobilior staged the first beast hunt in Rome as part of the celebrations associated with his recent military triumph.

The scale of *venationes*, in terms of the number and variety of animals involved, steadily increased thereafter, particularly as new sources of exotic animals were made available by Roman conquest. The largest beast hunts on record are those staged over 123 days by the emperor Trajan in the early second century CE in which 11,000 animals are said to have perished. In the later empire, as Roman prosperity and territory dwindled, it became ever more difficult to stage such costly events. Ultimately, it was these factors that led to the disappearance of beast hunts in the sixth century CE.

—Christopher Epplett

Gladiators enjoyed an ambiguous status in Roman society. On the one hand, gladiators, most of whom were slaves or criminals condemned to fight in the arena, were legally regarded as *infames*, a status they shared with such other social deviants as actors, pimps, and prostitutes. Those branded with *infamia* were not allowed to vote in elections or hold office, and they possessed very few other rights in the eyes of the law. The gladiator, in particular, could be treated as his *lanista* saw fit, without any recourse to legal appeal. It was considered disgraceful for any Roman citizen, particularly one of good family, to debase himself by choosing to fight in the arena.

Not all Romans, however, despised the gladiator. Successful gladiators could achieve a following among spectators, much like modern athletes; in particular, Roman women are sometimes said to have lusted after the brawny war-

rriors they saw in the arena. This is likely one of the reasons why Roman citizens, including members of the aristocracy, sometimes chose to debase themselves by entering the gladiatorial ranks despite the disparaging attitudes mentioned previously. Roman writers such as Seneca, taking a more philosophical approach, pointed out the potential edifying effect of a gladiatorial spectacle upon the audience. The bravery that a gladiator displayed while facing death in the arena fostered courage in the face of adversity on the part of spectators.

Although gladiatorial combat was a very popular form of entertainment for centuries, a change in societal attitudes, largely brought about by the conversion of the Roman empire to Christianity, ultimately brought about its demise. In the early fourth century CE the emperor Constantine extended official toleration to Christianity, and over the course of the next century it became the dominant religion in Roman territory. Christian attitudes toward many long-standing Roman spectator events were hostile, in part because of their pagan associations. In the case of gladiatorial combat, the objections of Christian writers included the murder and violence perpetrated on the arena floor as well as the negative effect that the viewing of such a spectacle might have on a Christian spectator. Faced with such growing opposition, gladiatorial spectacles gradually disappeared from Roman society. In 325 CE Constantine banned the practice of condemning criminals to fight in the arena, and by the mid-fifth century at the latest, gladiators were no longer to be seen in Roman arenas.

Entertainment in India

Some idea of the pastimes current at the time of the Buddha can be gained from a list in the *Tripithaka* of activities he thought unsuitable for those following his doctrines. These included many sports and public entertainments, such as cockfights, various games played with toys, guessing games, and riddles. Gambling and playing dice were also mentioned, as were board games.

Dice games in early Indian literature generally involved gambling. A poem within the *Rig-Veda*, "The Gamester's Lament," paints a vivid picture of the joys and sorrows of a compulsive gambler. A turning point in the *Mahabharata* was a dice game in which Yudhishthira progressively lost his wealth, his kingdom, and his own and his family's freedom. Such games have a long history in South Asia: cubical dice and gaming counters were found in the third-millennium BCE Indus cities.

In later times cubical dice were still used, but cowrie shells and tetrahedral dice were also used. In one game the player took a handful of the dicelike five-faced *vibhitaka* nuts (*Terminalia bellerica*) from a pile and threw them; he had to correctly predict the resulting score or throw a multiple of four. A game called *pashaka* used three tetrahedral dice; its object was to throw a previously agreed score. Gambling dens were regulated by the state, which taxed the stakes, the cost of the premises, and the hire of the establishment's dice. State spies kept an eye open for cheating.

Board games included the forerunner of chess, *chaturanga* (Sanskrit for, "army of four parts"), played on a board divided into eight by eight squares. The pieces represented the divisions of an army: a king, his chief minister or general, chariots, elephants, cavalry, and foot soldiers.

The antiquity and even the Indian origin of the game are uncertain. References in the *Mahabharata* to board games involving dice and colored ivory pieces do not say what game was played; other early Indian references are similarly unspecific. However, several seventh-century CE Persian texts refer to this game, in one case indicating that it came from India. A Chinese game, Xiangqi, is remarkably similar to

Ivory gaming die from the ancient region of Gandhara in present-day Pakistan, first-third century CE. (The Metropolitan Museum of Art/Art Resource, NY)

chess; it is probably known by the sixth century CE. The earliest surviving indubitable chess pieces, an incomplete set, come from central Asia, dated around 700 CE, but two possible chess pieces were found at the Kushan site of Dalverzin-tepe in Uzbekistan and one at Mantai in Sri Lanka, all dating to the second century CE.

Chess may be descended from an earlier Indian board game, *ashtapada*, or from a blend of features of *ashtapada* and a Greek war board game, *pettaia*. Alternatively, Xiangqi may be its ancestor, reaching India via the Silk Roads, possibly amalgamated with features of an Indian race game by the Kushans or by Silk Roads merchants. The question is still unresolved.

Ashtapada, mentioned in the *Tripithaka*, used an eight-by-eight square board and was played with dice, but nothing else is known; it may have been a race game. The name later came to refer to the board itself, on which various games could be played, and the earlier game fell into disuse.

Board games were popular even in the Harappan period. Some boards were engraved on bricks or made of terra-cotta. The arrangements of boxes and lines suggest there were a number of different (still unknown) games.

Pachisi, which is still played in South Asia, resembles modern ludo. Traditionally, six or seven cowrie shells were thrown to determine the number of spaces a player should move. Unlike ludo, the *pachisi* board includes 12 castle squares in which a player's piece is safe from

SEX AS ENTERTAINMENT

Sexual activity was treated with considerable tolerance, and under the Mauryas prostitution was officially accepted and taxed. Prostitutes had their own guild and often worked in state-supervised brothels. The state also utilized prostitutes' access to a broad cross-section of society by employing them as spies. Prostitutes could acquire additional income by performing as dancers or musicians at private parties. They spent some of this on instruction both in the skills of love making and in general cultural, intellectual, and practical subjects. A well-educated prostitute could hope to become the valued mistress of a wealthy man and might amass an independent fortune. Prostitutes could become important and well-respected citizens; some former prostitutes married or became Buddhist nuns.

—Jane R. McIntosh

being taken. An earlier race game, *Ashta-kashte*, may have been played in Early Historic times. This used a 7-by-7 square board around which the pieces were moved in a spiral to the center.

The elaborate forerunner of snakes and ladders, *Moksha Patamu*, was played partly for didactic reasons, teaching students about rewards (ladders) and punishments (snakes) in the cycle of rebirth. Many squares were decorated with symbolic designs that gave instruction on morality, ethics, cosmology, and religion.

Gambling was not confined to dice games. Bets were also taken on sporting fights between birds, such as cocks, quails, peacocks, or pigeons, or on animals including elephants, rams, goats, horses, bulls, and buffaloes. The South Indian *Sangam* literature describes a dangerous sport in which an unarmed young man wrestled a bull, watched by admiring girls.

Birds were also kept as pets, especially parrots and mynah birds that could be taught to speak and decorative peacocks; ladies often had a pet goose. Kings might keep a private zoo, and wealthy private individuals often had an aviary.

Bathing was a popular pastime, and many wealthy town households had a bathhouse with a sweat bath and a plunge pool. The houses of the well-to-do also had gardens containing fruit and vegetables, trees and flowering plants, a large

swing, and streams and pools. Public parks with pavilions, bright flowers, and sheltering trees gave city dwellers a place to picnic or relax.

Excavations at the third-century CE city of Nagarjunakonda in South India revealed a wide range of recreations. Games boards were carved on slabs covering the riverside steps (*ghats*), and brick platforms elsewhere in the city were probably used for playing dice and other games. There were a number of public bathing pools and a fine stepped tank on the citadel for the royal household. A recreation hall had pillars decorated with scenes of drinking and dancing. The city boasts a square amphitheater with stone seating for around 1,000 people. This structure, unique in ancient India, was possibly inspired by the Roman world, with which South Indians traded. It was perhaps a venue for sporting events or for performances of dance, music, or dramas since it has good acoustics.

Religious festivals provided high points in the year, with singing, dancing, and processions; sporting competitions; and performances by acrobats, conjurers, jugglers, illusionists, musicians, and other entertainers, including snake charmers. Kings and wealthy individuals sponsored dramas involving dancing and mime as well as recitation and dialogue. Musicians accompanied the performance and included drummers, flautists, vina players, and singers. At the spring festival, Holi, people used syringes filled with colored water to spray each other and engaged in other lighthearted behavior. During the three-day autumn festival of lights, called Diwali, taxes on liquor were lifted for the duration of the festival, and this encouraged uncontrolled imbibing of drinks such as palm toddy, sugarcane wine, and spirits flavored with flower blossoms.

Boxing with bare fists and wrestling are mentioned in the *Mahabharata*, and wrestlers are among the carvings at Nagarjunakonda. By historical times these sports were confined to lower-caste professionals. Wrestling matches were often sponsored by kings and nobles as public entertainment.

The Tamil *Sangam* poetry mentions stave fighting (*silambam*), combat with swords or spears, and archery contests, and martial arts were also popular in northern India. Archery was a sport particularly of the nobility. In the

Mahabharata the hero Arjuna won Princess Draupati in an archery contest in which the competitor had to shoot at a target on the ceiling while looking at its reflection in a pool of oil.

Many town and city dwellers were well educated and cultured, so they took pleasure in the arts and intellectual pursuits. There were competitions with generous prizes in which contestants had to speak extempore on a given topic, compose puns or riddles, or improvise poems. Kings or wealthy citizens sponsored poetry recitations and other literary events. The wider public took pleasure in storytelling such as the epic tales captured in the *Mahabharata* and *Ramayana*. Verse composition was actively pursued. In the *Sangam* poetry descriptions of an idyllic pastoral life are interwoven with love poetry and tales of war. Love and dalliance were indulged pastimes of the young throughout the subcontinent; when separated from their lovers, girls spent their leisure time conversing with their friends, playing ball, making garlands, and playing on swings, to judge by the art of the time. Both genders also enjoyed painting. Art was often used didactically, from an entertainer illustrating his tales of gods and ancient heroes with a painted scroll to the official guide taking visitors around the paintings and sculptures of earlier kings and saints in the palace galleries.

Early Popular Literature in India

The earliest popular literature of India includes animal fables, tales and stories, dramas, and secular poems. The hallmark is formed by its col-

THE ORIGIN OF INDIAN DRAMA

Indian drama emerged in the last centuries BCE. By the time of Bharata's *Natya Shastra* (between 100 BCE and 300 CE), or textbook on theater, drama was already fully developed. Its origin is sometimes traced back to the dialogue hymns of the *Rig-Veda*, one of the Holy Books of the Hindus (late second millennium BCE). Sanskrit drama may also have been inspired by Hellenic drama. No archaeological evidence survived to substantiate such claims. Sanskrit drama perhaps evolved from recital of the epics, possibly with accompanying music and explanatory gestures, or may have come forth from *samvadas*, conversations or dialogues in Prakrit. This possibility is hinted at by the Prakrit jargon in Bharata's textbook. The *vidushaka*, or jester, in early Sanskrit dramas spoke Prakrit as well. He typically interrupted the play for a witty comment in order to reduce tension. Bharata himself ascribed a mythical origin to drama: it was invented by the god Brahma to amuse the other gods.

—Alexandra van der Geer

lection of animal fables and tales, known as *Panchatantra*. It had a profound influence on works such as *1001 Nights* and the fables of De la Fontaine. The Buddhist Jataka stories traveled along with Buddhism to the rest of the world. The earliest surviving Sanskrit drama is the *Mricchakatika*, a light comedy of the second century BCE, that was staged in the United States in the early twentieth century. Southern India is renowned for its Sangam literature, a body of more than 2,000 secular poems on everyday life.

The *Panchatantra* is a collection of animal fables in verse and prose, composed in Sanskrit by Vidyapati between 100 BCE and 500 CE. Likely the fables preexisted in an oral form before they were written down. It was originally intended as a manual for royalty, and each fable or tale contains a wise lesson on political ethics and practical moral philosophy. The individual stories are inserted within a framework of a single narrative. They are told by the brahmin Vishnu Sharma to three dull-witted princes. Practical wisdom and common sense in the affairs of life are the main ingredients.

Translations into Persian (sixth century) and Arabic (eighth century) are known as *Kalila and Dimna*, after the two jackals of the first fable. The Greek version (eleventh century) was in turn translated into Latin and Slavic (twelfth century), whereas the Hebrew version (twelfth century) was translated into other European languages, known as the *Fables of Pilpai* (or Bidpai), a corruption of Vidyapati. Pilpai's fables formed the basis for the second compilation of fables of Jean de La Fontaine (1678). The *Panchatantra* also inspired sculptors of Hindu temple reliefs on Java. A seemingly independent but more copious treatment of the same animal fables is the *Hitopadesha* of Narayana, written in Sanskrit in the twelfth century.

The *Jatakas* are popular stories about the previous births of the Buddha. They form part of the Buddhist Canon, written in Pali. Each story ends with a moral lesson. The *Jatakas* were spread to Buddhist Southeast Asia, where they provided popular motives for temple reliefs. Likely the stories were not wholly invented by the Buddhist but preexisted in oral form.

Drama emerged as a distinct genre of popular literature in the last centuries BCE. One of the earliest is the Sanskrit play *Mricchakatika*, composed by King Shudraka (second century BCE). It is a light comedy about the love affairs of a young man and a noble man for a rich courtesan. Thieves, romance, and mistaken identities are the receipt for its hilarious character. Outside India, the play was staged in Berkeley as *The Little Clay Cart* in 1907 and in New York in 1924. Shudraka is said to have written two more plays, the *Vinavasavadatta* and *Padmaprabhritika*.

A somewhat later Sanskrit dramatist was Bhasa, who lived perhaps during the first or second century. Thirteen plays have been ascribed to him, but these were not all written by him. There is consensus that he wrote at least *Svapnavasavadatta* and *Carudatta*, both light comedies. Perhaps contemporaneous was Ashvagosha (ca. 80–ca. 150), who wrote the drama *Cariputra* in Shaurasena Prakrit. He also composed the *Buddhacarita*, a court epic narrating the life of the Buddha.

Early popular poetry from Tamil Nadu is known as Sangam literature, written between

200 BCE and 200 CE in Tamil. Tradition holds that the more than 2,000 poems were composed by hundreds of poets in Sangams, or literary academies, that lasted for thousands of years. The poems are secular in nature and deal with the aspects of everyday life. The poems are mainly known to us by anthologies, compiled around 1000 CE.

Olmec Rubber Balls and Ball Games

Ball games were conducted throughout Mesoamerica. The Olmecs are regarded by most scholars as Mexico's first great civilization, which arose somewhere around 1200 BCE in western Tabasco and southern Veracruz. Olmec culture/civilization reached its apex between 700 and 400 BCE. They remain a mystery as to their origins yet were able to devise their own language (as evidenced by their hieroglyphs) and a rudimentary calendar (akin to the more advanced one of the Maya). Accompanying Olmec evolution was the introduction of the ball game and ballcourt, although further elaboration and expansion occurred throughout Mesoamerica. Archaeologists have located spectacular examples of Olmec ballcourts in such places as La Venta and San Lorenzo. These early Mexican Indians were able to create rubber balls from the sap of the *guagule* tree found within their tropical domains. (The earliest known rubber balls were unearthed by archaeologists at El Manatí.)

While there existed a number of variants of ball games played throughout Mesoamerica, the ballcourt was the most typical type. Normally the ballcourt was formed via an alley, with two parallel structures with end zones opposite one another. A solid rubber ball was struck by players, who aimed for a ring or markers found along the alley or hit the ball into the end zones. Although the rules varied over time and also location, the two teams that competed were usually composed of two to three members (which meant normally no more than six contestants). In the most popular variant of the ball game the players utilized their upper arms and thighs to strike the ball (the use of hands was not allowed with the exception of placing the ball into play).

Another variant/type of the game, according to paintings found by archaeologists in Teotihuacan (central Mexico), contestants used instruments similar to hockey sticks and a small ball. Ball games were generally an all-male sport, as only at Yaxichilán within the Maya heartland have images showing women involved in the sport been located by scholars of Mesoamerica's past heritage.

Many peoples of Mesoamerica viewed the ball game in association with the movements of heavenly bodies such as the sun, the moon, and Venus. Yet the games also were reenactments of warfare and human sacrifice. For one team the outcome could mean not only defeat but also death, resulting in decapitation or perhaps being tossed along a gauntlet of victors culminating with being thrown down a flight of stairs. The actual rubber balls, which were initially made by the Olmec culture, could range in weight between 1 pound and 7.5 pounds (0.5 and 3.5 kilograms). In reality, depending upon the glance received by the player, he might be either maimed or killed.

Chinese Musical Theory and Instruments, 1000 BCE–300 CE

In ancient China, musical theory was based on the notion of harmony (*he*); this idea was expressed through the consonance of the five sounds (*wusheng* or *wuyin*), or five notes, that were called *gong*, *shang*, *jue* (also *jiao*), *zhi*, and *yu*. These terms are used even in present-day Chinese music. The earliest texts on ancient Chinese musical theory, dating from the fourth to the second centuries BCE, record attempts to integrate music into a correlative cosmological system. According to these texts, the Five Sounds, or Notes, were related to the Five Processes, the

➤ CALCULATING NOTES AND TEMPERAMENT WITH THE *SANFEN SUNYI-FA*

Notes and temperament (*lü*) were calculated with the *Sanfen sunyi-fa*, a method of subtracting or adding the third part. This method consists of alternatively adding and subtracting one-third the length of the vibrating object: the length is divided into three equal parts if the whole is taken as a basic note; shortening the length by a third produces a fifth higher, whereas lengthening by a third produces a fourth lower. In this way 12-pitch standards (*shi er lü*) can be obtained, relying on the alternation of rising fifths and falling fourths, with ratios 3:2 and 3:4. For example, if 81 (3×27) is the starting length, the second length would remove one-third, making it 54 (2×27). In order to obtain the third length, one-third of 54 (or 18) would be added, generating 72 (4×18). When one-third of the third value (72) is subtracted, the fourth value is created: 48 (3×16). The fourth one originates the fifth one, again, by adding one-third (or 16) to create 64 (4×16). In this way, the five lengths will be 81, 54, 72, 48, 64. From these pitch standards, we get the five notes of the pentatonic scale that has five sounds per octave. The pitches of the five notes were not fixed, but they designate movable notes, depending on the pitch of *gong*, which was decided to be the first; hence, there were 12 possible pentatonic scales, 12 modes starting on different pitches.

—Elisa Sabattini

Five Directions, the Five Tastes, and the Five Colors. Concerning the Twelve Pitch Standards, they were matched to the Twelve Months, the Twelve Terrestrial Branches, and so forth. In this way, the human society was deeply linked to the impersonal forces of the cosmos.

In Han times (206 BCE–221 CE) a system of music developed that included 12 keys (as with the Western chromatic scale), with a five-note, or pentatonic, scale applying to each. The five-note system and the calculation for the temperament appeared very early. They are first mentioned in the *Guanzi* (*The Book of Master Guan*), dating to the fourth to the second centuries BCE, for calculating the five notes of the pentatonic gamut, but not the pitch standards. Both the *Lüshi chunqiu* (*Spring and Autumn Annals of Mr. Lü*) dating to 241–235 BCE, and the *Huainan zi* (*Book of the Prince of Huainan*), compiled sometime before 122 BCE, use the *Sanfen sunyi-fa* for producing 12 pitches. Around the turn of the first century BCE, Sima Qian wrote the *Shiji* (*Records of the Grand Historian*) in which he included one chapter on music (*yue*) and another on temperament. The five notes appear also in the inscriptions on the set of bells found in the tomb of the Marquis Yi of Zeng, which were cast before the imperial unification in the fifth century BCE. The musical terminology was finally standardized during the Qin empire (221–207 BCE), together with the rectification of weights and measures.

The *Zhou Li* (*Rites of Zhou*), dating to the third century BCE, classifies Chinese musical instruments under eight categories (*ba yin*, or “eight sonorous substances”) according to the materials used in their construction. These eight categories are metal (e.g., bells and gongs), stone (chime stones), clay (ocarinas and clay pots played as percussion instruments), leather (drums), silk (including plucked, bowed, and struck string instruments), wood (mainly wooden percussion instruments), gourd (mouth organs and wind instruments), and bamboo (mainly woodwind instruments such as flutes, oboes, and reed-free pipes). However, the historical validity of this traditional combination is problematic: archaeological discoveries show that instruments were not always made of the material under which they were classified, meaning that there was much more variety in their construction. Af-

ter the middle of the Western Zhou period (1050–771 BCE), the search for melody and exact tuning took priority over timbre. Consequently, some instruments, such as wind and string instruments, assumed the leading role instead of drums and percussion instruments, which provided rhythmic and timbric accompaniment.

The Religious Music of Ancient Israel

Music in ancient Israel and late antiquity Judaism served a predominantly religious function. Accordingly, major changes in Israelite musical style coincided directly with pivotal transitions in the worship cultus, thus yielding three musical periods: the pre-Temple folk music of the House of Israel (before 957 BCE), music performed in or intended for the Jerusalem Temple (957 BCE–70 CE), and synagogue service music (after 70 CE).

Salient features of the earliest Israelite music are discernible from study of the oldest oral and written sources now making up the Pentateuch. Composed during the tribal period of Israelite history, this music bears close resemblance to the traditions of the similarly nomadic Bedouin Arabs, which have been passed down for millennia with little change. Such Jewish folk music was marked by terse lines, understandable text, abundant repetition, and simple stepwise melodies centering upon a few pitches. It was punctuated by formulaic shouts designating the deity and/or the tribal group, such as “Return, O Yahweh, to the countless hosts of Israel” (Num.

Clay tamborine and aulos player figurines, Israelite, about 800 BCE. (Erich Lessing/Art Resource, NY)

10:36). Primarily vocal with instrumental accompaniment and led by lay women and men (Ex. 15:1, 20–21), its wild, noisy, and vigorous timbre coupled with an infectious beat immediately lent itself to physical movement and induced ecstatic experiences. Instruments from two string families typically served accompanying roles: *kle shir* (lit. “the tools of singing,” normally translated as “lyres”) and *Isbarim* (lit. “for the singers,” normally translated as “harps”).

Temple music was led by a professional and official body of musicians dubbed the levitical cantors and featured all manner of instruments, including the *shofar* (curved ram-horn trumpet), *kinnor* (lyre), *nebel* (kithara), between 2 and 12 *balil* (cane pipes), and *mezaltaim* (cymbals). This elaborate instrumentation fashioned a ceremonial splendor unsurpassed elsewhere in the Ancient Near East. The biblical psalms, compiled from the reign of David to the constitution of the Second Jerusalem Temple (ca. 1000–500 BCE), occupied the central role in Temple liturgy, with a different sevenfold arrangement of psalms governing each week (e.g., Pss. 24, 48, 82, 94, 81, 93, 92 for Sunday through Shabbat). While the tonal particulars of psalmic settings are unknown, the Hebrew poetic structure discloses their general musical features. Sophisticated antiphonal (call and response) devices provided numerous possibilities for dialogue between a soloist or solo group and the larger assembly. Musical rhythm was governed by the text of each psalm, and voice leading featured drones of unisons, fourths, and fifths rather than harmonies.

Originating in the Babylonian Exile but assuming centrality after the Roman destruction of the Second Jerusalem Temple (70 CE), synagogues embodied a modified Temple worship style that omitted music attending the sacrifices

and simplified professional musical sections for amateur performance. Led by laypeople, the service structure comprised readings from the *Torah* and the *Nevi'im* (Prophets), psalmody, teaching, prayer, and benediction. The readings, psalms, and prayers were cantillated, or recited in embellished speech resembling simple song. Mirroring the grammar of its text, each chant gravitated around one note from which concise melodic movement would occur.

PSALM 18

Discovered at Qumran in 1947, the Dead Sea Scrolls shed light on all facets of the music of ancient Judea. The following psalm (first century BCE) furnishes an incisive glimpse into the devotional life of a professional Temple musician and the assortment of instruments played by this ancient artist.

“I raised a bitter lament
and made a doleful moan and groan
and plied my harp in
mournful dirge . . .
suddenly I perceived
that there was no more affliction. . . .
Then did I ply my harp
with music of salvation,
and my lyre to the tune of joy;
yea, I plied the pipe . . .
in ceaseless praise.”

—Kirk R. MacGregor

Psalm 18 of the Dead Sea Scrolls, quoted in Alfred Sendrey, *Music in Ancient Israel* (London: Philosophical Library, 1969), 193.

Music in the Ancient Near East

The first Sumerian documents (ca. 3200 BCE) attest that music making was integral to the temple economies around which the earliest cities developed. Celebration singers (*nar*) hymned the gods with harps, lyres, and double pipes, while lamentation singers (*gala*) soothed and forestalled their wrath. Most temple musicians had nonmusical duties too. As kingship developed, music was also incorporated into palace life, as shown by numerous representations and the magnificent instrument remains from the royal cemetery of Ur (ca. 2600 BCE).

The Sumerian tradition was widely influential. At Mari on the middle Euphrates, temple singers adopted Sumerian names and priestly costume around 2300 BCE. In contemporary Ebla in North Syria, the Sumerian model of musical management was also current, although the distinctive local character was maintained. The Babylonians and Assyrians in turn adopted the offices of *nar* and *gala* and continued to cultivate Sumerian liturgical repertoire down through the first millennium, long after the Sumerian language itself was no longer spoken (ca. 1800).

Stone relief from the palace of the Assyrian king Sennacherib depicts musicians leading a religious procession to the temple of Ishtar, 705–681 BCE. (Barbara Heller)

The Sumerian system of diatonic scales was translated into Akkadian by circa 1800, and scribes learned it throughout the second-millennium Near East. At Ugarit, a Canaanite city on the Syrian coast in close cultural contact with Mycenaean Greece, a schematic musical notation (still undeciphered) was based on the Sumerian scales around 1400. But musicians were more important than scribes for spreading the tradition. Palace and temple records throughout the Near East, including Egypt and Hittite Anatolia, reveal musicians traveling far and wide between courts and temples. They were bought, sold, and traded by kings who craved variety (much like collecting CDs today). Especially prized were female performers, specifically trained as a commodity for royal gift exchange. They typically had to perform other less savory services too. But even women of the king's own family were trained in music, with an eye toward diplomatic marriages, as well as in general cultivation. As to the music of ordinary people, scholars have virtually no information for any period.

According to biblical traditions, when David and Solomon organized the First Temple in the tenth century, they adopted a system of hereditary musicians' guilds that are strongly reminiscent of those at Ugarit and ultimately reflect standards of royal attainment established by the Sumerian and Akkadian monarchs (the Hebrew words for "palace" and "throne" were both Mesopotamian loanwords). Solomon allegedly commissioned 40,000 lyres and harps of precious woods, stones, and electrum so that the Levites could sing the Lord's praises. He clearly desired a royal apparatus equal to that of his peers.

The neo-Assyrian emperors (ca. 912–609) replaced royal reciprocity with a conscious program of centralization. Their archives and reliefs attest to the frequent transfer of musicians to the Assyrian palaces as booty or tribute. The emperors exploited music to symbolize the *Pax Assyriaca* (Assyrian Peace) proclaiming a feast of music for the princes of the four regions who had submitted to the yoke. The Assyrian Peace was a cosmopolis in which music served as a common language in the banquet halls of The Willing. The best evidence for this comes from Lydia, a client-state in western Anatolia with which the Greeks

had close contact circa 675–547 BCE, where Mesopotamian harps and concert ensembles make a sudden appearance under the local dynasty.

Music in Ancient Greece

The Minoan and Mycenaean palaces (ca. 1700–1100 BCE) both housed professional musicians who performed religious hymns, royal praise poetry, and various other musical rituals. To understand this period, scholars have relied on the physical remains of instruments, musical scenes in various media, and later myths about magical musicians such as Orpheus, Thamyras, and Amphion. Double pipes (*auloi*) and seven-stringed lyres indicate that the classical tonal system of Mesopotamia was known. During the Dark Age (ca. 1100–750 BCE) that followed the mysterious collapse of palatial society, Mycenaean traditions were replaced with local traditions. Religious music survived through continued worship of Mycenaean gods, especially in Lesbos, Athens, Thebes, Sparta, and Cyprus. Praise poetry—epic song celebrating famous deeds of gods and men—reached new heights in the Ionian migration to the eastern Aegean (ca. 1000–800). Homer (ca. 700) is the last great representative of this school, which used formulaic metrical expressions to improvise performances accompanied by the *phorminx*.

In the Archaic period (ca. 750–500), renewed prosperity and Pan-Hellenism brought musical innovations. While liturgical music continued, secular personal expression was cultivated by

THE DIATONIC CYCLE

Translations of cuneiform tablets published in the 1960s prove that the Sumerians knew a cyclical system of diatonic tunings by circa 2100 BCE. This conception, the ancestor of modernity’s own circle of fifths and heptatonic scales, was previously credited to the ancient Greeks of the fourth century BCE. It reflects the high musical development achieved in the early Mesopotamian temples and palaces. The system was certainly transmitted to Greece, probably in the Mycenaean period. It may also lie beneath the Persian, Arabic, and even Indian modal traditions. But this is an area that has received little attention since the system’s discovery.

—John Franklin

singer-songwriters in lyrics accompanied with the lyre. These songs are preserved as the works of the lyric poets such as Archilochus, Sappho, Alcaeus, and Anacreon. Musical skill became synonymous with polite breeding. The lyre teacher (*kitharistes*) drilled children in music, letters, and classics such as Homer; girls were similarly educated in places such as Sappho’s Lesbos. Throughout Greece, choral performance was a second pillar of education for both genders. Music motivated physical and (for the boys) martial training and sweetened poets’ moral lessons; athletic victories and civic rituals were also celebrated. Terpander, Alcman, Pindar, and Bacchylides were famous singers. Men contributed musically to symposia, the drinking clubs central to aristocratic society. Increasingly technical art-music was pursued in tyrants’ courts and at the festivals of Delphi, Olympia, Delos, Sparta, and Athens. An Assyrianizing fashion in the Lydian capital of Sardis, the Paris of the times, meant renewed exposure to contemporary Near Eastern music. Complex new tonalities were introduced by the *aulos* to choral music, including its fifth-century Athenian outgrowths, tragedy and comedy.

This aulos revolution culminated in the controversial New Music (ca. 425), with Euripides its most famous exponent. An evolving new tonal system was given final form by Aristoxenus,

KEY INSTRUMENTS

Lyres (defined by two arms, a crossbar, and equal-length strings) were common throughout antiquity. Harps (single arm and tapering strings) were more typical of the Near East and Egypt. Both came in many varieties. Greek epic singers used the *phorminx*, a round-based lyre with perhaps only a few strings. The later *kithara* was a grand seven-stringed concert lyre with a flat base; Hellenistic models could have nine or more strings. *Lyra* typically meant the tortoise-shell instrument of students and amateurs. Double pipes (Greek *aulos*) were widespread both for solo and ensemble play; they had a clarinet's cylindrical bore but the double reeds of an oboe. Percussion varied regionally, but frame drums, hand cymbals, castanets, and sistrums were widely used.

—John Franklin

Marsyas plays the double pipes and Apollo plays the lyre, detail of a red figure lekythos, Greek, from Peastum, fourth century BCE. (Musées Nationaux/Art Resource, NY)

Aristotle's musicologist and author of the earliest extant work of music theory, *The Harmonic Elements*. A musical notation system was based on his theory and used modified letter forms written over a text's syllables. A later source indicates the musical key that these refer to, so extant scores can be deciphered. More than 60 of these, mostly fragmentary, are known from manuscripts, inscriptions, and papyri. Two hymns to Apollo, inscribed on the Athenian treasury at Delphi in 127 BCE, best represent the mature style. *Mousike* had by this time become sophisticated entertainment, often purveyed by traveling companies such as the Technicians of Dionysus. In the cosmopolitan Hellenistic period (ca. 323–31 BCE) that followed the unification of the Eastern Mediterranean and Near East by Alexander and his successors, Greek theaters and concert halls were widely erected, and *Mousike* became a staple of cultured life. With Rome's first conquest of Greece in 197 BCE, this art came to Rome alongside drama, literature, and philosophy. As Horace famously recalled, "Greece, though captive, captured its wild victor."

Music, melody, harmony, rhythm, meter, tone, tune, ode, chord, and chorus all derive from Greek (often via Latin) and are shared in

one form or another by most European languages. Thus, while the artistic use of sound is a human universal, present ideas of music are fundamentally indebted to Greek *Mousike*.

■ Introduction: Domestic Architecture

By domestic architecture, historians and archaeologists mean buildings that people made their homes in. These are the buildings of everyday life, where families were raised, meals were eaten, and people slept. As such, there was tremendous variety in the types of homes that people lived in throughout the world from 1000 BCE to 300 CE, from small temporary campsites to block-length apartment complexes to large country villas. It is difficult to make generalizations about this variety of experiences since much of the architectural design was contingent on cultural values, environmental issues, and availability of resources.

Yet houses were not just places for people to sleep. The home carried significant social messages and was a means of communicating information about the identities of the owners/residents. These status messages are particularly noteworthy in the urban societies of 1000 BCE to 300 CE. The following entries explore how status and social relationships were communicated through domestic architecture in a number of these urban settings.

—Kevin M. McGeough

Roman Houses

Roman houses in the city had few or no windows, and from the outside, a house would seem like a blank wall. The center of the house, and its focal point, was the atrium—a courtyard with a large opening in the ceiling to admit light. The entryway to the house, called the *vestibulum*, usually connected directly to the atrium. In the center of the atrium there was often a pool of water, the *impluvium*. Opening onto the atrium was a raised platform called the *tablinum*, which was where the paterfamilias would sit when receiving visitors of lower status. For example, when a man's clients came every morning to pay their respects at the *salutatio*, the patron would greet them seated in the tablinum. The dining room, or *triclinium*, also usually opened onto the atrium. In the back of the house was a series of tiny rooms that served as bedrooms. Each of

these was called a *cubiculum*. The quarters for slaves and women were also at the rear of the house. Some Roman houses also included a walled area at the back that was open to the sky and served as a garden. Roman houses were more or less the same range of sizes as modern houses, with the average house measuring around 1,980 square feet (184 square meters).

The most obvious and famous feature of these houses was the lavish decoration of the walls and floors. Much of the expense and effort that, in a modern home, might be spent on furniture and decorative objects, the Romans directed toward ornamenting the structure itself. In many rooms, all four walls were plastered over and then completely covered with elaborate wall paintings, while the floors were coated with intricate mosaics.

To a modern viewer, the palette of colors employed in Roman wall paintings might well appear strange, dominated as it was by large expanses of black, gold, and a distinctive, deep blood-red shade. Art historians have divided the types of wall paintings into four basic styles, a system that, while being somewhat reductionist and arbitrary, nonetheless gives a sense of chronological development.

The earliest phase, known as First Style wall painting, features panels painted to look like marble blocks, along with three-dimensional molded cornices and other elements protruding from the wall in low relief. The Second Style is characterized by columns painted on the wall at regular intervals and, between them, increasingly complex illusionistic panels that attempt to give the impression of three-dimensionality and depth as if the viewer were looking through a series of windows. These scenes often consisted of fantastic cityscapes or architectural vistas of arches, tripods, gardens, and buildings. The Third Style employs large, plain rectangles of solid colors within which are painted smaller rectangular paintings, creating an effect reminiscent of a series of pictures hung on a wall. Mythological scenes and human figures were frequent subject matter for these pictures. The Fourth Style encompasses a variety of effects, such as

► INSULAE—APARTMENT BUILDINGS

In Rome and other big cities, only a tiny percentage of urban Romans could afford their own homes. The rest lived in high-rise apartment buildings. The Romans called them *insulae*, or “islands,” because of the way they often occupied entire city blocks. *Insulae* were located all over the city of Rome, and some of the larger ones might have had 10 or more stories. Because of the destruction caused by poorly built *insulae* collapsing, emperors set limits on the height of *insulae* several times. Usually these limits were around 60 or 70 Roman feet (58–68 feet or 20–25 meters), and the fact that the emperors felt the need to repeatedly pass such legislation suggests that these limits were routinely ignored. The poet Martial, in *Epigrams*, mentions one wretched *insulae* dweller who had to trudge up 200 stairs to reach his squalid apartment in the attic.

Insulae housed a wide variety of tenants of differing socioeconomic classes. The ground-floor apartments would have been rented to the wealthiest tenants, who did not want to have to climb up many flights of stairs to reach their dwellings. Often, the row of rooms opening onto the street was rented out as shops and small businesses. As you climbed up the levels of the *insulae*, the wealth of the tenants declined and the number of people per room increased. The least desirable rooms, located under the eaves of the roof, frequently leaked and were inhabited by vermin. A chamber pot served as a toilet, and despite legislation

prohibiting such actions, full pots were routinely dumped out the window.

Romans living in such apartments would have had a much more rudimentary set of possessions than was owned by wealthy Romans in a *domus*. Their sum total of worldly goods may have been nothing more than some clothing, bedding, footwear, a lamp, cookware and utensils, and perhaps some crude furniture. The poet Juvenal, in *Satires*, lists the belongings that one unfortunate *insulae* dweller lost in a fire, which consisted only of an undersized bed, a cupboard, an old storage chest, six cups, a flagon, and a statue.

Ancient sources record numerous instances of *insulae* collapsing, but Roman law did not offer tenants much protection. Juvenal (in his work *Satires*) describes the walls of a typical *insulae* as having gaping cracks, which the unscrupulous landlord attempted to conceal, and only the liberal use of wooden props prevented the whole edifice from immediately crumbling to the ground.

The owners of *insulae* included many famous Romans, and the orator Marcus Tullius Cicero was one such slumlord who owned several *insulae*, including one that collapsed because it was so poorly made. Cicero, in *Letters to Atticus*, expressed no concern for the lives lost in the disaster and cheerfully noted that he would rebuild it and be able to charge higher rents for the new building.

—Gregory S. Aldrete

painted architectural elements rendered in a spindly, attenuated style and small, delicately painted garlands, designs, and figures.

Floor mosaics were made by taking very small, cut pieces of colored stones and pressing them into wet mortar to create images ranging in complexity from simple black-and-white geometric patterns to astonishingly detailed color pictures. The subject matter of these mosaics was extremely diverse, with some of the most elaborate examples depicting historical scenes, mythological stories, wild beasts both exotic and mundane, and realistically rendered sea life.

By current standards, Roman houses would have appeared surprisingly empty. Much of the basic furniture was made of bronze. To sit on,

Romans could choose from an assortment of bronze chairs, stools, and sofas with varying numbers of legs. Several types of low, bronze braziers testify to attempts to heat the cold house interiors in the winter. Marble was also employed for benches and tables, and some of the more elegant types featured elaborately carved legs and supports. In addition to furniture, smaller household objects would have included a full range of pots and pans, eating utensils, wood and wax tablets to write on, and the ubiquitous olive oil-burning clay lamps that brought light to dark interiors.

The *domus*, or aristocratic Roman house, was not so much the dwelling place of a nuclear family but rather of an extended household, includ-

ing relatives, slaves, and servants. Roman homes do not seem to have had pronounced internal divisions among areas inhabited by men, women, and children or even between master and slave, and standards of privacy were probably less than what many modern people are accustomed to.

The rooms tended to serve multiple purposes as well. The atrium, for example, was a site where the male head of the household might receive clients, meet with peers, and conduct business, but it was also a space shared by his wife, and it served as a playground for his children. The Romans believed that a person's house reflected the owner's character and status, and the social function of the house included significant public as well as private uses. The patron-client system that bound together Romans of different ranks and statuses involved a number of social rituals that took place in the main rooms of the domus or on the street in front of it.

Four-Room Houses and Israelite Ethnicity

The broad-room house, four-room house, and the pillar-courtyard house are common terms for a structure that came into prominence during Iron I (ca. 1200 BCE) and lasted until the monarchical period (ca. 900 BCE) in biblical Israel. It has a rectangular or square shape, one or two rows of pillars forming a courtyard, and two or three adjoining rooms. Some sites have stone steps, indicating that the pillars supported a second story. The central courtyard contains a cistern and a hearth. Side rooms were likely pens with domestic living space upstairs. Such houses were typically arranged in clusters, with the vil-

TEL MASOS

Tel Masos, containing about a dozen pillar courtyard houses, lies just south of the central hill country and appears to have linked trade between the coast, the Negev Desert, and the central hill country. Because of the village's location and trade connections, it may indicate that the pillar courtyard house was not specifically Israelite. Yet the economic base of the village was dry farming and the herding of small cattle, which is in keeping with the Israelite villages of the central hill country. The site has been identified with the biblical cities of Hormah (Israelite) and Amalek (Canaanite).

—Laura M. Zucconi

lage itself laid out as an oval compound. A concentration of pillar-courtyard houses is found in the central highlands, but some sites are in the northern plains, Philistia, and Transjordan. Antecedents for a pillared private dwelling can be found at Tel Batash in Late Bronze II (ca. 1300 BCE).

In order to determine the ethnicity of the pillar-courtyard house, several key points are usually addressed: the language of associated inscriptions, pottery association, layout of the site, and the link between settlement patterns and the Hebrew Bible. Finding inscriptions in either Hebrew or Canaanite can indicate the linguistic ethnicity of the site's population, but mixed-language populations are possible. The presence of collar-rim jars may mark Israelite ethnicity since their occurrence, like the pillar-courtyard house, increased during Iron I and II with a concentration in the central hill country. Archaeologist Ann Killebrew refrains from assigning ethnicity to the jars but does see its distribution as a marker of a social boundary. The clustered grouping for pillar-courtyard houses is linked to the idea of *mishpaha*, or clan, found in the Hebrew Bible and is thus called Israelite. The settlements themselves tend to be in an oval shape, causing Fritz, and later Finkelstein, to argue that the pillar-courtyard house developed from bedouin tents that used the space in front of the tents for meetings. They link these structures to the sedentarization of nomadic Israelites in Iron I. Yet the Tel Batash site may indicate that the courtyard developed from Egyptian-style palaces at Late Bronze (LB) Megiddo and

Ugarit. From the Middle to Late Bronze Age there was a reduction in size and number of urban settlements, but they retained continuity in the material culture. The transition from LB to Iron I saw not only a shift in the settlement pattern but also an accompanying change in the material culture, such as house and jar designs, that could be more regionally defined. This development is thought to correspond with stories in Joshua and Judges of the Israelite conquest and settlement in the thirteenth to twelfth centuries BCE.

Attributing Israelite ethnicity to the pillar-courtyard house impacts four key theories for the emergence of Israel: the peaceful infiltration theory whereby nonindigenous seminomads permanently settled in the central highlands, creating biblical Israel; social revolution theory whereby Israel developed from an indigenous peasant population revolting against a Canaanite elite ruling class; pastoral Canaanite theory whereby Israelite Iron Age central highland settlements developed from those Canaanites forced into pastoralism during the LB period; and the mixed multitude theory whereby loosely organized indigenous groups developed ties with infiltrating external groups.

Classical Chinese Domestic Architecture, 1000 BCE–300 CE

The classical Chinese architectural style with origins now associated with the Han dynasty (206 BCE–200 CE) and the Han ethnic group

emerged during the Han period from technologies and architectural styles that can be accredited to earlier periods and regions. These include the Shang dynasty (roughly 1600–1100 BCE), the Zhou dynasty (1122–221 BCE), and the Qin dynasty (221–206 BCE). The Shang and Zhou dynasties can be regarded as Bronze Age, whereas the Qin and Han dynasties indicate the commencement of the Iron Age with its new technologies. In the Qin-Han period, building techniques and structural designs were rejuvenated and entered completely new phases of development. In terms of continuity, techniques and typologies rather than aesthetics and style characterized Chinese architecture.

Chinese buildings of these periods were constructed from natural materials: *tu* (earth) and *mu* (timber), and so architecture was commonly referred to as *tu mu*. Timber frames bear the roof, and earthen walls enclose the building and stabilize the timber frame. Many building techniques were utilized, including laying mud brick and ramming earth. Two main categories of timber structures may be found: *tailiang* and *chuandou*. Tailiang structures employed a column and beam frame characterized by the placement of beams on columns repeatedly until the ridge was formed. Its basic structural unit is a bay consisting of four columns and beams. When a large space was required, it could be achieved by manipulating the dimensions of the skeleton or expanded by adding a bay (or bays) either at the front, the rear, or both. The chuandou style involved a post and tie framework with longitudinal purlins (horizontal supports for rafters) resting directly on posts and with beams tying the posts together in the transverse direction.

The pitched roof was a characteristic component of Chinese architecture. To prevent leakage, the roof was thatched or topped by roofing tiles. In the early Zhou or Western Zhou (which lasted until 770 BCE), tiles were used to cover the ridge, hips (or diagonally sloping roof edges), and eaves. Early tiles were made with pins or hoops to be received by the clay mortar or secured in place by fiber lashings. Roofing tiles were heavy. The heavyweight roof added stability to the timber-framed building and drove the development of timber structure; the impact of

tiled roofs was profound during this period. The ridge and hips were terminated by end tiles of particular design; the ridge end tiles (*chiwei*) in particular served both technical and symbolic functions. Tiles used as the first course along the eaves of a roof were shaped differently. They were starter-over-tile (*wa dang*) and eaves-under-tile. The starter-over-tile had a flat end: half round (before the Qin) or round (from the Qin-Han). The end was decorated with motifs that varied in different times. Building structures were of mortised column and beam framework. There were many types of mortis-tenon developed to ensure the joints. A bronze fastener (*jingong*) was used for holding together two or more timbers to reinforce the rigidity of the structure. This bronze device was decorated with silver and gold inlay in palace buildings of the Spring and Autumn (770–476 BCE) period.

Owing to the development of iron tools for woodworking during the Qin and Han dynastic periods, wooden joints became stronger. The bronze fasteners gradually lost their structural function, but their ornamental function continued. Timber structures required painting for weather protection, and the intricate pattern and motif found in the bronze fastener continued in such decorative painting. Viewed from an aesthetic point of view, the painting accommodated the influence of the fastener design.

The basic construction techniques of such timber buildings are column-beam networks joined together with the assistance of blocks and brackets (*dou gong*). The blocks and brackets, one of the important characteristics of Chinese architecture, were developed to sophistication in the Han dynasty period. Architecture that has survived from the Han includes stone gate towers (*que*) in Sichuan, Hebei, and Henan provinces. They represent storied building of timber structure with block-bracket sets.

Pottery models and pictorial bricks (*huaxiang zhuan*) unearthed from Han tombs represent many different types of buildings, including storied buildings in courtyard compounds. These architectural representations reveal that local traditions and regional peculiarities remained and influenced each other in the Han dynasty, when China achieved a new measure of imperial unity.

Ceramic end of an eave cover tile, late Han dynasty. (AsiaStock)

Column bases were used, which may be made of wood, bronze (during the Bronze Age), or stone (Iron Age). From the mid-Shang onward, columns rest on top of foundation stones rather than piling into the soil, which reveals that the wooden structure was much more stable than before.

Floor bricks were used to pave the foundation platform to protect it against rain and damp. Stairs leading up to the platform level were made of hollow bricks. The bricks were decorated with impressed or molded patterns to aid steady footing on the stairs. The decorated steps of stone in the Forbidden City, Beijing, are remnants of this ancient tradition. During this period, people sat on the floor, and furniture was developed to accommodate them. In the Warring States period (403–221 BCE), the low table (*an*), arm rest (*ji*), screen (*ping*), and coatrack were popular. Both archaeological evidence and pictorial representations reveal that a big wooden bed (*ta*) was utilized not later than 500 BCE. In the north, the heated bed (*kang*), originally a platform heated prior to retiring for the night but later a bed built over an oven, still remains common in rural villages.

Evidence for Elite Architecture in the Andes

Monumental complexes arose very early in the Andean region and along the Peruvian coast. The earliest monumental complexes date to several millennia BCE. Archaeologists have often accepted the construction of monumental works as implicit evidence for status differentiation and the existence of an elite socioeconomic class, supposing that an elite managerial class was needed to plan and direct the construction of such monuments. This common assumption is contradicted by evidence from the Andean region, since the best evidence for social differentiation is often the corporate architecture itself rather than other markers of elite status or control. Relatively little research that would provide needed insight into status differentiation has been conducted in residential areas outside of monumental architectural cores.

Early monumental complexes in the Andes are unwaveringly interpreted as religious in nature. Such complexes embrace several religious traditions: (1) a coastal tradition of large U-shaped complexes of platform mounds and square

sunken courts known as the Paraiso tradition, (2) a northern highland tradition of small rooms with ceremonial fireboxes known as the Kotosh religious tradition, and (3) a southern highland tradition of sunken plazas surrounded by multiple rooms associated with the Yayamama religious tradition. People had largely ceased using the U-shaped and Kotosh complexes by the middle of the first millennium BCE. They were replaced by monuments of the Chavín tradition, while the Yayamama tradition persisted until the middle of the first millennium CE.

One of the best-studied early complexes is that of Chavín de Huántar located in the Andean highlands at the confluence of the Mosna and Huachecsa rivers. Archaeologists have investigated both the ceremonial architecture as well as the surrounding habitation areas at Chavín. The site is well known for its massive ceremonial architectural core, where construction probably began around 850 BCE. The earliest structures center on the Old Temple, a symmetrical stone-faced, U-shaped platform fronted by a sunken circular plaza. After 390 BCE, the Old Temple was partly remodeled and substantially enlarged with a larger square-shaped court, a fancy gateway, and additions to the platform mound, creating the New Temple. By the time temple modifications began, the site had grown to maybe 3,000 inhabitants, many times larger than any surrounding village. Evidence for craft specialization, complex engineering, and differential access to space, rare goods, and the best food support the idea of growing social differentiation at the site.

Less well known is the southern Yayamama religious tradition represented by the sites of Pukara and Chiripa in the Lake Titicaca basin. Chiripa's complex dates slightly earlier (800–250 BCE) compared to Pukara (400–100 BCE). Both sites have similar ceremonial complexes comprised of square stone-lined sunken courts surrounded by detached one-room structures with cut stone foundations along three or four sides of the courtyard. The restricted access to the courtyards and the fine quality of the associated cut stonework has led to interpretation of these complexes as products of an elite priestly class. Early archaeologists originally interpreted the rooms surrounding the sunken courts as residences of elite priests, although today they are

Ruins at the Andean site of Pukara, Chile, 400–100 BCE. (Dreamstime)

seen as storerooms. Evidence of socially differentiated urban populations surrounding these sites is currently lacking, leaving doubt as to the degree to which the architecture represents the dictates of an elite class.

YAYAMAMA

What is the Yayamama religious tradition? In the local Andean language, "yaya" refers to man and "mama" to woman. Thus, the tradition literally translates as "Man-woman." It was given this designation based on several pieces of stone sculpture in which both a male and a female anthropomorphic beings was represented. Pieces with this same basic theme of male-female duality have come to light all around the Lake Titicaca basin. The anthropomorphic figures in these sculptures are associated with a variety of animals including frogs, wild cats, llamas, and what may be either a snake or catfish. Unfortunately, many of the pieces have been removed from their original contexts. Some were moved in ancient times, but others have been set up in local school yards as public sculpture gardens. This makes it difficult to confirm how closely related the sculptural tradition is linked to the use of the square sunken courts.

—Jo Ellen Burkholder

■ Introduction: Art

The Classical traditions of the period from 1000 BCE to 300 CE are readily apparent in the art that was produced at this time. This was the period in which many of the artistic traditions of world visual culture were elaborated; many of these traditions are still apparent in art that is produced today. The Greek and Roman art that was produced throughout this period had a profound influence on later European art (on the artistic traditions normally thought of as Western). Greco-Roman artists established some of the fundamental types of artistic media; the styles of sculpture and painting created in Greek times are still made today. They also established much of the thematic content of Western art that remained prominent until the artists of the early twentieth century CE broke from these traditions.

One of the most influential changes in world art in this period is the development of the idea of the portrait. While there are some hints of early portraiture in Near Eastern and Egyptian

art (it is possible to identify some individualized traits in some of the art of Mesopotamia and Egypt), the dominant aesthetic was to produce stylized and conventionalized images of people based on their social standing. Individualized traits were depicted through the objects people held, the clothes they wore, or their posture. From 1000 BCE to 300 CE, individualized portraits that reflected the physical appearance of the subject became increasingly more common. By Roman times, it is apparent that the goal of the artist was often to depict a real-life image of the person. This transformation is well demonstrated in the evolution of Egyptian coffins, which at the beginning of this period lack the real-life individualized features of the deceased but by the end of the period are decorated with a realistic portrait that the deceased must have posed for at some point during his or her life.

The Greeks and Romans were not the only ones producing art that would have a formative

effect on later artistic traditions. The art of Mesoamerica at this time created traditions that were prominent until the Spanish conquest of the Americas and are still present to some extent in indigenous art. Chinese art continued some of the themes in many of the same media that were used in earlier periods. However, they continued to elaborate on these patterns, producing art that would influence generations to come. In the case of African art, it is less clear how much of the art produced from 1000 BCE to 300 CE is based on new traditions and how much is derived from earlier art, since the earliest African art is not well preserved. Certainly Egyptian influence can be seen in Meroitic art. Likewise, it is unclear how much of the art produced at this time directly influenced later African art. In many ways, though, the African art of this period can at least be viewed as representative of formative artistic traditions.

—Kevin M. McGeough

Meroitic Style

Meroitic style follows ancient Egyptian artistic conventions but integrates distinctive Nubian characteristics and certain influences from the Mediterranean world. This unusual amalgamation of ideas was once thought to be the result of poor Egyptian craftsmanship. Nowadays, this distinctive style is described as typical Meroitic style.

Relief from the west wall of the Apedemak Temple at Naga.
(Caroline M. Rocheleau)

Egyptian artistic traditions were adopted during the Napatan period, particularly during the Twenty-fifth dynasty (716–656 BCE). Yet the Kushites reinterpreted Egyptian art and gave it a subtle Nubian twist. (The Kushites never denied their cultural roots.) The Meroitic period, which lasted from approximately 275 BCE to 350 CE, is characterized by an affirmation of more traditional values, a change highly noticeable in art and architecture. Via peaceful relations with Hellenistic (Greek) Egypt and later with the Roman empire, the Meroites came in contact with ideas of the Mediterranean world. All of these influences are visible in painting, relief, sculpture, and architecture.

In painting and relief, Meroitic style is distinguished by stout proportions of figures, particularly of the female body. This tradition goes back thousands of years to prehistoric Nubia. Males are depicted with broad shoulders and muscular limbs, while females have generous breasts and imposing curves. Such representations symbolized the fertility, wealth, and power of the person depicted. The bodies are nonetheless drawn in the typical Egyptian manner, a combination of both frontal and profile views that allowed each part of the body to be immediately identified.

The Meroites innovated when faced with artistic challenges, as seen on the west wall of the Apedemak Temple at Naga. Although it may appear as if Apedemak was a three-headed lion deity, this was not the case. Apedemak was shown with three heads because both King Natakamani and Queen Amanitore were simultaneously offering to him. To show that the god was receiving both rulers at the same time, the artist gave Apedemak two heads in profile, each facing a ruler, and one head in frontal view to ease the awkward link between the two profiles.

In sculpture the Meroitic *ba* statue of Lower Nubia is derived from the ancient Egyptian concept of the *ba* (soul), which was represented as a human-headed bird. The *ba* statues are winged human figures that were placed outside tombs, perhaps so that offerings would be made to the deceased. These *ba* statues are some of the most expressive examples of Meroitic art.

In architecture, both the pyramid and the temple were concepts adopted from Egypt. However, the Kushites adapted the buildings to

their own religious ideas. The pyramids are smaller and steeper (more like the Egyptian non-royal pyramids of the New Kingdom than the enormous royal structures of the Old and Middle Kingdoms), and the temples have different layouts of rooms than those in Egypt.

Musawwarat es-Sufra is home to puzzling Meroitic architecture and innovative concepts. The Great Enclosure continues to baffle scholars. The various buildings (currently labeled temples), ramps, and enclosure walls have been interpreted as anything from pilgrim lodgings to war elephant training grounds. Nonetheless, Musawwarat shows beautiful architectural details, such as the end of a wall sculpted in the shape of an elephant.

Nok Terra-cotta Sculpture

South of the Sahara in the central part of Nigeria, the Nok civilization thrived from approximately 1000 BCE (and possibly quite earlier) to 1000 CE. It was named after a village called Nok, a small settlement located in north-central Nigeria near Jos, that may have been settled as early as 4580 or 4290 BCE. As indicated by its terra-cotta artifacts, Nok culture was one that encouraged high artistic expression. Scholars believe that Nok civilization and art were at their height of cultural expression circa 500 BCE and then mysteriously vanished toward the end of the first millennium CE. Contradictory dates for Nok artifacts abound in the literature, and two modern scholars, Maurer and Langevin, argue for the period spanning 1000 BCE to 300 BCE. Nok terra-cotta sculpture consists of the oldest known examples of African artifacts depicting animals and human heads/busts.

Much of the sculpture is highly stylized and sophisticated. Sizes of figures range from a few inches tall (e.g., 48 centimeters) to nearly life-size depictions (e.g., 4.5 feet, or 1.4 meters). Fig-

Terra-cotta head, Nok Culture, Nigeria, 900 BCE–200 CE. (Werner Forman/Corbis)

urines include people in standing, kneeling, or sitting positions. Some of the sculptures are of fused groups to suggest “Janus” or multifaced figures. In all these sculptures the heads are larger than the rest of the body, well out of proportion. Heads are geometric and can be conical, cylindrical, or spherical. The faces are serene, with the eyes often elongated downward-pointed triangles and the eyebrows also angled in a simple geometric fashion. Beards, hairstyles, bangles, neck collars, and bracelets as well as adornments of ears, nose, and lips are carefully rendered. Statues of elites depict the subjects in cotton clothes, whereas commoners wear small aprons. Some sculptures are of horse riders, while others fuse human and animal characteristics.

The first major discovery of the Nok terra-cotta was made by an Englishman, Lt. Col. J. Dent Young, and his team during a mining expedition in the early twentieth century. They discovered a group of terra-cotta artifacts including a monkey head, a human head, and a foot, which

were later placed in a museum in Jos. When later alerted to these discoveries, extensive archaeological work was carried out in the 1940s by Bernard Fagg, then employed as an archaeologist by the government of Nigeria; his research led to a collection bequeathed to the Nigerian National Museum that opened in Jos in 1953. Other pieces have made their way into private collections especially in Europe.

Terra-cotta are burnt effigies produced from alluvial mud or clay dating back to 2,500 years ago; the Nok terra-cotta exhibits similarities with later Ife terra-cotta of the Yoruba kingdom. One theory posits that the Nok artwork was culturally transmitted and evolved into the Ife terra-cotta. The Nok terra-cotta was characterized by a unique style and a fine finish carried out to a high degree of refinement using bare hands without tools. While the Nok style did not survive into contemporary times, similar methods of terra-cotta production are still being used by local artisans. These methods involve forming, molding, and rolling of the coarse grain clay materials, which may be sun dried or burnt in an open hearth of temperature over 572 degrees Fahrenheit (300 degrees Celsius). The Nok terra-cotta artifacts indicate a society that was hierarchical and sophisticated, with an elite served, in part, by artists able to devote themselves full-time to their trade while others farmed, worked iron, and completed daily tasks.

Hellenic Art

The ancient art of the Greek mainland and Aegean region, known as Hellenic art, provided the foundation for an entire Western tradition. Hellenic art, which includes architecture, is organized into stylistic periods that document the eventual dispersion of Greek artistic theory and culture around the Mediterranean world. The Greeks deliberately cultivated their unique artistic style by adopting characteristics from the arts of neighboring peoples and adapting these characteristics to appeal to their sensitivities.

By the dawn of the tenth century BCE the impoverished people of the region, having been invaded by the Dorians in a century prior, were producing small ceramic pieces and minor bronze objects, such as garment pins. These Dark Ages gave rise to the stylistic period called Geometric (1000–700 BCE) during which ceramic vases became large scale and were commonly used as grave markers. Painted on them in black were rigid geometric patterns and figures of humans and animals in silhouette. Statuettes of men and animals were formed of bronze, since stoneworking skills had not yet been regained. The architectural remains that do exist, few of which are large scale, reveal construction materials of mud brick, wood, and thatch.

Once confronted with the arts of the Near East, the Greeks abandoned the Geometric style for another known as Orientalizing (700–600 BCE). It is on pottery from the city of Corinth where the Orientalizing motifs of floral and vegetal origin developed, usually in combination with Eastern animals, such as the panther. The black-figure vase painting technique, in which the painted black figure has incised detail and added color, was introduced in Corinth. Since the Greeks had established a colony in Egypt and Greek mercenaries were routinely hired by the Egyptians, Greeks became aware of immense Egyptian architecture in the forms of pyramids and temples. Impressed, they adapted to their needs the Egyptian concepts of permanence and splendor. At that moment, the development of Greek temple architecture, one of the greatest contributions of Hellenic art, was propelled forward; the two architectural orders, Doric and Ionic, were born.

The Archaic period (600–480 BCE) provided for the development of monumental stone architecture and sculpture. Temple plans and architectural orders became increasingly standardized. Temples consisted of a central room, the *cella*, for the display of the cult statue. A colonnade defined the edge of the rectangular platform, upon which the *cella* stood. Doric was the less ornate of the two orders and possessed an alternation of grooves and square panels along the upper temple exterior. Columns appropriate to the order had a shaft with vertical channels and a top element composed of a cushion-like member beneath a square slab. At the temple peak was a triangular element, the pediment, that contained a sculptural program. The Ionic order was more decorative and slender. The grooves and panels of the Doric order were replaced with a horizontal course upon which sculpture was pinned. The Ionic order column was provided a carved base and a top element composed of volutes. The principal freestanding statuary types of the Archaic period were the stone male *kouros* and female *kore* figures, both revealing the influence of Egyptian style over life-size statuary. Greek sculptors borrowed the basic stance of the Egyptian figure type (frontal pose, arms at side, one extended leg) but made one important change. The *kouros* figure was sculpted as a nude, which was acceptable in Greece where men exercised in the nude. As the style of the Archaic period developed, sculptors improved the anatomy of the nude *kouros* and the drapery of the *kore* figures. The Greeks also developed a casting technique allowing for life-size hollow bronze statues. In vase painting, Athens gave rise to the red-figure technique in which the background was painted black, which allowed the painter greater freedom. Greek panel and wall painting was produced but is no longer extant.

Art of the Classical period (480–323 BCE) focused primarily on sculpture for the first 30 transitional years. The *kouros* and *kore* types were replaced with the anatomical realism of the Early Classical Severe style. Marked improvement in the sculptors' understanding of how the human body moves took place. In vase painting, genre scenes of everyday life increased in frequency. The pinnacle of fifth-century Greek art, known

Left: Doric column from the Temple of Hephaestos in Athens. Right: Ionic column at Delphi, Greece. (Dreamstime)

as the High Classical, fulfilled anticipations of prior periods. Athens, under Pericles' leadership, initiated a building program on the Acropolis with construction of the Parthenon. Dedicated to the goddess Athena, this temple is an unusual combination of Doric and Ionic orders. Pediment statuary exhibited contrasts between light and dark with deeply carved drapery folds. The sculptor Polyclitus, who worked beyond Athens, wrote a treatise on human proportions. His studies culminated in figures that stood with counterbalanced limbs in a pose known as *contrapposto*. Idealism was a primary goal. Regardless of provenance, the sculptures, with expressionless faces, seemed distracted and distant. Although the red-figure technique was prevalent, the white-ground technique became popular in vase painting and allowed for the application of many colors. The political decline of Athens initiated a later Classical stage during the fourth century in which sculpture became deeply personal and the artist was free to foster his own style. Idealism was no longer the goal, and subject matter became increasingly secular, not only in sculpture but also in vase painting and mosaics. The circular-planned temple was developed during the period, as was a new columnar order with sculpted leaves called Corinthian.

After the death of Alexander the Great, the dispersion of Greek culture among non-Greeks

THE PERICLEAN BUILDING PROGRAM UPON THE ATHENIAN ACROPOLIS

With the transfer of the Delian League's treasury to Athens in 454 BCE, Pericles had the funds to begin a large-scale building program upon the Acropolis. Four buildings were planned, with the sculptor Phidias supervising. The Propylaia and the Parthenon, both with Doric and Ionic characteristics, were constructed prior to the first Peloponnesian War in 431. During breaks in hostilities and after the death of Pericles in 429, the Ionic Uruktheion and Temple of Athena Nike were built according to plan. Visitors to the Acropolis would pass through the monumental gateway known as the Propylaia. Once beyond it, they were confronted with the massive scale of the Parthenon. This temple served as the home of Phidias's 38-foot (11.6-meter) cult-statue of Athena Parthenos. Steps from the Parthenon was one of the most complex temples upon the Acropolis, the Uruktheion. The Uruktheion was dedicated to Poseidon, Uruktheus, and Athena; it was composed of at least three rooms on four different levels. Upon one projecting porch stood life-size female statues, known as Caryatids, that supported the roof overhead. Upon a bastion near the Propylaia, the small Temple of Athena Nike was constructed. Around the bastion, a balustrade was constructed to keep worshippers safely near the temple.

gave rise to the Hellenistic period (323 BCE–31 CE). The demand for genre art representing different age groups, classes, and races was high. Realistic, not idealistic, portrait sculpture purchased by private patrons indulged personal tastes. Expressive faces and variety of pose became the norm. People of this period invented art history as they looked back to the Classical period with appreciation and a desire to revive it.

After 31 CE, Hellenistic art was inherited by the Romans. With the Roman conquest of Greece, a new era of looting and copying of original Greek artwork ensued. The Romans had become Hellenized.

Roman Portraits and Historical Reliefs

The Romans produced portraits and historical reliefs to commemorate prominent citizens and events. At times these works seem realistic, but what they really are is plausible. The portraits of the first century BCE depict sitters, usually male, with all of their wrinkles, moles, and bald patches. But because these portraits were produced in a period of civil war and were generally of old men, they transmitted the message that these were wise and hardened survivors and therefore ideal leaders.

That Roman portraiture is more than just a faithful rendition of appearance is demonstrated by the emperor Augustus (27 BCE–14 CE), who overturned previous trends and chose youthful, confident types of portraiture that reflected the new prosperity of Rome under his rule. Augustus was young when he came to power, but artists continued to produce youthful portraits of him even after his death in old age. That they were adjusting more than just age is suggested by the biographer Suetonius's *Life of Augustus* in his description of Augustus's appearance, which disagreed on a number of points with the portraits.

(Alinari/Art Resource, NY)

In the second century CE, when luxurious hair came to symbolize manliness, the emperor Hadrian (117–138 CE) adopted a beard. Both private citizens and subsequent emperors followed his example and were depicted with beards and exceedingly thick, curly hair. Since it seems incredible that most Roman men were bald in the first century BCE but virtually none were bald by the second century CE, Roman portraits were likely less about how people actually looked than about how they wanted to be perceived.

Roman state reliefs often created the same illusion of realism. One of the earliest Roman historical reliefs now extant is the relief depicting the Battle of Pydna (168 BCE) between the Romans and a Macedonian king. This relief decorated a monument in Greece, and its narrative details indicate that we are looking at this battle and no other. Such detail can create the illusion of realism. Nevertheless, the combatants are separated into elegantly composed groups and displayed on a blank background. The composition is pleasing, and the viewer can make out the action from a great distance, but the result does not bear much resemblance to the messy experience of battle.

Romans were also fond of reliefs that depicted the daily activities of their officials, and in this respect Roman art could indeed be realistic. The subjects of Roman historical reliefs included census taking and animal sacrifice (the so-called Altar of Domitius Ahenobarbus), processions (the Altar of Peace), or highlights from the deeds of a Roman emperor (the Arch of Trajan at Beneventum). Such works provide historians with a great deal of information that would be lost to us if the Romans had not been in the habit of producing historical reliefs.

Achaemenid Architecture, 550–330 BCE

In the history of pre-Islamic architecture in Persia, the Achaemenid age is often considered to be the period of critical development. In addition to the grandeur, splendor, and power of its architecture, the Achaemenid age was also marked by a capacity for large-scale planning of structures for the ruling elite as well as more general urban planning. Moreover, at a social, cultural, and political level, this age is highlighted by a practical administrative ability reinforced by a noble faith that inspired great religious and cultural tolerance. The Achaemenid empire included Iran, Mesopotamia, Syria, Egypt, Asia Minor, Thrace, and parts of northwestern India. Within this culturally diverse empire a unique international Persian architecture formed and developed. This architecture adapted and synthesized several cultural characters under the supervision of Persian masters. This eclectic mix of tastes, styles, and motifs is evident in the architecture of three Achaemenid complexes: Pasargadae, Susa, and Persepolis.

Pasargadae, a complex of palaces and temples built in the southern province of Fars in 550 BCE by Cyrus the Great, was the capital of Persia under Cyrus's reign. The city was the physical embodiment and expression of political and divine power of a king who promised peace and justice to not only Persians but also other nations. Although much of Pasargadae now lies in ruins, some parts are still preserved. These include the rock-cut tombs of Darius the Great and his successors, Ka'be Zartosht (which is a sanctuary or a tomb tower), some royal palaces, and the tomb of Cyrus the Great. Made of white limestone, the gabled-shape tomb of Cyrus was placed on a stepped platform. Measuring 36 feet (11 meters) in height, it was built like a ziggurat with Ionian and Lydian features. It has a small entrance and double doors leading to a room with no windows, which once contained Cyrus's golden coffin. This tomb still survives after 2,500 years.

After the death of Cyrus the Great, Pasargadae was abandoned. In 518 BCE Darius founded a new capital at Persepolis that was more elaborate

View of the ancient ceremonial center of Persepolis, southwestern Iran. The site was constructed in the sixth century BCE and served as a residence for Achaemenid kings. (Gerard Meijssen)

than Pasargadae. One of the earliest complexes built on such a grand scale, Persepolis spread over 1.3 million square feet (120,000 square meters) on an immense artificial platform and consisted of several public and residential buildings. It is an exhibition of royal magnitude, power, and wealth rarely exceeded by other cultures. Persepolis served not only as a royal palace for Darius I but also as a national shrine and setting for the Persian spring festival (*nowruz*), which agents and ambassadors of all regions of Iran and other countries attended. To create the impressive architecture at Persepolis, the Achaemenids erected numerous columns, wide stairs, grandiose gates, thick walls, decorative reliefs, colored mosaics, royal inscriptions, column capitals, and sculptures of animals. To construct this complex, Darius ordered materials and workers from other parts of the Persian empire. The Achaemenids took the artistic forms and architectural elements, spaces, and decorations from other civilizations and combined them into a hybrid form with a Persian identity in erecting Persepolis.

The palace of Darius at his winter capital of Susa (of which only a couple of column bases survive today) was built over an Elamite site. With a rational and impressive layout, its main trait was a large columnar reception hall, measuring 375 by 180 feet (114 by 55 meters). There are detailed surviving documents about the construction of Darius's palace at Susa. In one of

these texts, Darius explains the internationality of this architecture, listing materials used in its construction from the following locations: Lebanon, Gandara, Carmania, Sardis, Bactria, Sogdiana, Chorasmia, Egypt, Ionia, Ethiopia, Sind, and Archosia. The craftspeople who helped construct the palace are equally international, including Ionians, Sardians, Medes, Egyptians, and Babylonians.

Parthian Art and Architecture, 250 BCE–226 CE

The Parthians (250 BCE–226 CE) controlled most of the trade routes between Asia and the Greco-Roman world, which brought great wealth that was used for widespread artistic and building activities. The reconquest of the Iranian plateau by the Parthians brought a slow return to traditionalism and a renewal of the Iranian national spirit. The development and evolution of the art and architecture of the Parthians was strongly connected to the social and cultural events of the era. During the first century BCE, the Parthians added Greek elements to some buildings, particularly to the facade and interior decorations of the buildings. One example of this was the palace at Asur. Although the use of stucco was an influence of the Greeks, it was developed by the Parthians, who also used Ionic, Doric, and Corinthian capitals with Persian column shafts in their architecture. The architectural plans of these temples combined elements found in both Achaemenid Persepolis and Greek temples. For example, Greek and Persian styles are evident in such architectural details as distinctly Persian columns with Corinthian capitals. The plan of the temple at the site of Khurkha is wholly Greek, but it contains columns that widely depart from the classic proportions be-

tween height and diameter (an Iranian practice already in use at Persepolis in this period).

Parthian architecture and art lack strong unity and instead reflect significant diversity. Artistic production does not represent one coherent style and is divided into two distinctive periods. The first of these periods maintained the Hellenic ideals of the Seleucids, while the second witnessed a metamorphosis in artistry and creativity. After the first century of the Parthian era, the empire never maintained a powerful central government. Instead, the Parthian empire consisted of many local governments ruled by Parthian kings, and from time to time one of these local governments would revolt and seriously challenge the central government. Nevertheless, the power of the local governors produced both diversity and variety in Parthian art and architecture.

After the second century BCE, local schools of art flourished, and the Greek elements were gradually replaced by a distinctive Parthian style. Artists and architects in this era enjoyed a greater extent of freedom than had their predecessors in the Achaemenid and Seleucid dynasties. This increase in the ability of artists to create works that differed from traditional Achaemenid and Greek styles was the result of the independence that local governors enjoyed in the second century BCE. This was a century of growth in terms of wealth and influence of the caravan cities of Palmyra, Hatra, and Mesene. Whereas earlier Achaemenid and later Sassanid art were royal, imperial, religious, and mostly monumental, the Parthian art can be characterized as popular. Parthian works reflected the cultural trends among the populace. Many projects were ordered by rich clients from the private sector and had no royal or religious function. These works illustrated the creativity of the artists and the power of the wealthy patrons. The creation and development of Arabesque style and zigzag molding are examples of Parthian artistic innovation. By the late first century CE artists and architects had begun to create a different style of art that reflected a new freedom and led to a series of important artistic and architectural achievements. In Mesopotamia, figures often came to be represented frontally, or full face, giving the images an otherworldly quality. The *iwan*, a great hall open on

one side with a high barrel-vaulted roof (examples in Asur, Hatra, and Uruk), supplanted Greek forms that had been introduced during the Hellenistic period in Mesopotamia and Iran. To construct these huge vaults and halls, architects used fast-setting gypsum mortar. Often walls were plastered with gypsum. Stucco decoration was uncommon in Iran before the Parthian period, and it was during the Parthian era that interior stucco decoration and wall painting using geometrical, vegetal, and figural ornaments came into vogue in the region.

Didactic Themes in Chinese Art

In China, the first painted images of people were not portraits of powerful sovereigns but instead were morally perfect humans. This reflects the importance that the ancient Chinese placed on self-cultivation and using the past as a mirror for the present. These didactic images adorned both public places, such as the walls of government buildings and schools, and private spaces, such as tomb decor and everyday items. As a result, their messages touched not only their rich patrons but also illiterate commoners. These moral stories became popular as Confucianism became more socially entrenched.

Based on textual evidence, the practice of decorating items and walls with the images of exemplars was a comparatively late development. In the late Warring States period (480–221 BCE), sovereigns adorned their palace and ancestral temple walls with the images of good and bad rulers of high antiquity. In the Western Han (206 BCE–25 CE) period, nobles adorned their palace walls with paintings of sage kings, evil rulers, loyal retainers, filial sons, and virtuous women.

Upon reaching the first and second centuries CE, these depictions spread to government offices and schools as well as to the tombs and shrines of the educated elite. Archaeological data indicates that they became particularly widespread in the tombs of the second- and third-century literati.

The exemplars that were portrayed were primarily Confucian. In one of the earliest illustrated tales, a wise minister tells a duke to get rid of three powerful warriors by offering them two peaches. In trying to possess one of these peaches, the three generals kill each other. This tale shows that wisdom is more important than brawn, a typical Confucian message. By the second century CE, the didactic narratives that appear most frequently are those of filial sons, outstanding women, and loyal retainers. One of the most common filial piety stories is that of Ding Lan who, overwhelmed with grief, carves out a wooden image of his deceased father and serves it as if it were alive. A frequently illustrated tale of an outstanding woman is that of Gao Xing of Liang who, when under pressure to remarry, cut off her nose to make herself unattractive to would-be suitors. As for steadfast retainers, the most frequently depicted tale is that of Jing Ke, who willingly assumed the suicide mission of assassinating the First Emperor of China to redress the insulted honor of his patron. The greatest example of the use of didactic narratives can be found engraved on the walls of the Wu Liang funerary shrine (151 CE), which included images of 8 legendary sage kings, 8 outstanding women, 17 filial sons, and 8 loyal retainers.

The existence of these images of exemplars reflects the importance that the early Chinese placed on moral cultivation. History's basic purpose was to teach good behavior. Images of past exemplars would remind the viewer of the exemplar's deeds and inspire him or her to copy them. Due to this emphasis, early Chinese figure painting was devoted to glorifying past moral heroes rather than powerful contemporaries. It is important to note too that the growing popularity of these images coincided with the rise of Confucianism; consequently, educated men adorned their goods and tombs with these de-

pictions to show their commitment to Confucian virtues. Of course, images could be "read" in many ways; thus, more than one emperor was scolded for viewing images of outstanding women more for the beauty of their looks than their virtue.

The Scythian Animal Style

The Scythian Animal Style was a type of art practiced by a pastoral nomadic group of tribes of Indo-European cultural and linguistic heritage who ranged widely over the Pontic steppes north of the Black Sea during the seventh to the third centuries BCE. The Scythians, as the Greeks called them, were the westernmost group of a very widespread steppe nomadic horse-riding culture that covered much of central and western Asia and had a strong tradition of Animal Style Art.

Animal Style Art has great antiquity and is present in a unique stylized form from the earliest period of recognizable Scythian culture. In a larger context it is possible to think of it as a widespread Scytho-Siberian Animal Style with roots going back perhaps as far as the third millennium BCE and covering much of western and central Asia and the Near East. Some clues as to the early origins of the Scythian Animal Style might derive from widespread Bronze Age rock carvings of north-central Asia such as at Yelagash or Kalbak-Tash that seem to have similar stylistic themes.

Scythian Animal Style Art was most often rendered in finely crafted bronze or gold work that perhaps developed from earlier widespread nomadic traditions of carving animal forms in

bone and wood. The symbolism in the Scythian Animal Style must have imparted not just social but also cosmological and mythological significance that made sense to members of Scythian society. For pastoral nomads in general, animal representations were undoubtedly symbols of power and authority within the social hierarchy. They must have also represented desirable traits such as strength and vigor. As such, they were perhaps a means to imbue their owners with such traits. Animals represented in Scythian art include real and imaginary as well as wild and domesticated varieties, with perhaps the most common being the stag. Other commonly represented animals included horses, goats, felines, griffins, and dragons. Animals were often placed in artistic scenes depicting predation or combat, with imaginary beasts and felines often attacking antlered or hooved varieties.

The essence of the Scythian Animal Style was that in a single rendering, the artist attempted to represent the full range of attributes of a particular animal. This was often accomplished by depicting the animal as if simultaneously both in motion and at rest. Among the artwork of the ancient world, the Scythian Animal Style was unique in that its characteristics included an effect of monumentality and an emphasis on intensity and power intended to create profound psychological impact. These effects were accomplished by rendering animals as if in action with muscles tensed. Real animals were often placed in artistic contexts that contrasted with imaginary beasts along with intermediary animals that seemingly provided a connection between them. Much of the worldview of Indo-European peoples such as the Scythians was informed by an ideology of tripartite wholeness that pervaded aspects of society, religion, and art. Three hierarchically divided functions would thus perhaps serve to provide order and harmony within aspects of Scythian cosmology. It is therefore possible that the Scythians ordered various classes of animals within such a three-tiered cosmology that perhaps represented life, death, and passage to the netherworld.

Although the animal representations in Scythian Art are at their core uniquely Scythian in character, they also betray stylistic influences

▶ ANIMALS REPRESENTED IN SCYTHIAN ART

Although the popularity of different types of animals varies through time in Scythian art, among the most basic representations are recumbent deer or goats, coiled felines, and birds with enormous beaks. These usually occur with a repertoire of fantastic animals such as lion-bulls or griffins of various forms. A common artistic technique was to combine body parts from different animals to create such strange beasts as horse-dragon-lions, griffin-horses, or griffins with fish-wings. Interestingly, horse representations are rare and seem to occur most often either as part of fantastic animals or in predation contexts. Other animals represented include elk, boar, dog, hare, fish, dolphin, cattle, sheep, lion, ibex, ram, bear, elk, and eagle.

—Kerry D. Nichols

from other cultures that Scythians frequently encountered in their travels. From the sixth to the fourth centuries BCE the stylized character of Scythian animal forms slowly gave way to Hellenistic influences to create a more naturalistic art style that included both animals and humans. Overall, the impression over time is one of changing style and subject matter, perhaps due to increased cultural contact and interaction with many different parts of the ancient world.

Olmec Style Horizon

The Olmec constitute one of the most widely recognized contributors to the Preclassic era (ca. 1450–300 BCE) of Mesoamerican cultures, as they were the first in the region to excel in the production of monumental art. They are often thought of as a kind of “mother culture” for the Mesoamerican region because of the many contributions made to mathematics, writing, architecture, and artistic endeavors of later civilizations such as the Maya, Zapotec, and Teotihuacan. Though the largest and most influential Olmec centers developed on the Gulf Coast side of the Mexican Isthmus, Olmec influences have been noted at least as far away as Costa Rica. Early research even postulated connections between the Olmec style horizon (that is, the diffusion of the Olmec style) in Mesoamerica with the Early or Chavín horizon in western South America. Modern archaeologists now recognize two phases of the Olmec style horizon: an earlier San Lorenzo horizon and a later La Venta horizon, each marked by different distributions of Olmec ceramics and other goods.

Definition of the Olmec style horizon largely derives from archaeological investigations of four major sites in the Gulf Coast region of Mexico: San Lorenzo, La Venta, Tres Zapotes, and Laguna de los Cerros. Outside of this Gulf Coast “heartland” region, Olmec and Olmec-style materials are widely dispersed and show up in significant numbers at major sites in the Oaxaca Valley, the Mixteca Alta region, and farther south at sites in Honduras and Costa Rica. The distribution of Olmec-style pieces across a broad region of Mesoamerica has long raised questions about the nature of interactions between the Olmec and their neighbors.

Two competing hypotheses have framed the debates over the nature of the Olmec style horizon. One, often called the “sister culture” hypothesis, suggests that what is known as “Olmec” style is really a material expression of widespread religious ideas shared by people across Mesoamerica. Accordingly, Olmec sites in the Gulf Coast such as San Lorenzo and La Venta are merely two of many chiefly centers between which interactions grew substantially after about 1350 BCE. Other hypothesized cen-

ters include San Jose Mogote and Etlatongo in the Oaxaca Valley. Differences in site assemblages with Olmec-style materials can thus be understood as regional adaptations of this larger shared set of ideas.

The second hypothesis, that of the Olmec as a “mother culture,” states that the Gulf Coast centers were in fact originators of the materials and iconography associated with Olmec style and that these materials were distributed to other regions through long-distance elite exchange networks beginning after 1350 BCE. According to this hypothesis, the Olmec dominated an interaction sphere in Mesoamerica, and differences in assemblages are understood as reflections of the different relationships that the Olmec had with various people, trading some materials to one group and not to another.

Until recently, several problems have complicated the debate over Olmec style and its meaning. One major problem has been looting at Mesoamerican sites to furnish display pieces for private and public collections. In a fever to collect the best pieces, even monumental examples of Olmec art have been removed from their original contexts, and their exact provenience has been put in doubt. A second, less onerous, problem has been methodological. Archaeologists have relied heavily on outward appearances of artifacts—surface finish, colors, shapes, iconography—that might be easily mimicked. Detailed studies of manufacturing techniques, organization of production, and the resulting composition of artifacts have been lacking.

Recent chemical analyses of ceramics and lithic materials may be close to resolving this debate. Neutron activation analyses of ceramics from the site of San Lorenzo and from other Preclassic centers suggest that Olmec-style materials from San Lorenzo are distinctive in their composition, and these distinct materials appear at other sites, but materials from other sites are not represented in San Lorenzo collections. The influence flowed from San Lorenzo outward, not in an equitable pattern of exchange. Similarly, chemical analysis of green stone axes has suggested a homogenous source located somewhere in the Olmec heartland. These studies tend to support the “mother culture” hypothesis of Olmec originality and cultural influence.

► THE FATE OF OLMEC ART

Olmec art may have become a victim of its own fame. Up until the early twentieth century, little attention had been paid to the remains of Olmec culture. It was not until the swell of petroleum exploration in the early twentieth century that many people went far into the tropical forests that then surrounded Olmec sites. Unprotected by national or international laws, pieces of Olmec sculpture were often given away or sold to various dignitaries and collectors. In fact, the earliest understandings of Olmec art and culture came from the pre-Columbian art market.

The slow trickle of pieces into various private collections gained momentum after the 1940s when the work of Matthew Stirling at the Olmec site of San Lorenzo made headlines and the glossy pages of *National Geographic*. Both national and international museums became eager to collect Olmec pieces. Within Mexico especially, as the country worked to forge a unified Mexican identity, museums sprang up that then needed representative collections of the country's glorious past. As

an originator of one Mesoamerica's great art styles, Olmec art was a necessary element of such collections.

As local people began to realize the value of Olmec art to outsiders, they began to come together. In general their goals were not to protect their local patrimony but instead to essentially hold it for ransom until they received desired infrastructural improvements like schools, roads, and electricity. At the same time, local people have also come to understand the economic impact of tourism and have also asked that particularly spectacular pieces be left in local community museums. This has often led to heated political debates and confrontations among people in the region.

Today, with many sites insufficiently guarded, pieces of Olmec art still make it onto the pre-Columbian art market. Looters, seeking personal gain rather than betterment of some resident community, continue to find ways to take advantage of the allure of one of America's earliest art styles.

—Jo Ellen Burkholder

Repeated themes and specific stylistic aspects of the way artists rendered those themes define the Olmec style horizon. At the largest sites, materials include large basalt sculptures (colossal heads and altars), smaller sculptures and engraved stelae, figurines and other portable art, and ceramic vessels. For reasons of size and weight, the large basalt monuments appear to have been placed only at major Olmec centers in the heartland.

Sculpture is the most widely recognized element of Olmec art, and several repeated themes distinguish the style. On a small scale are polished stone celts and the so-called were-babies, anthropomorphic representations with babylike limbs and torsos and elongated heads depicted with a snarling mouth and animal-like fangs. At the large end of the scale are Olmec altars and colossal heads. Based on distinctive details, the colossal heads probably represent portraits of important people. Olmec portrait heads range in size from about 5 to 11.5 feet (1.5 to 3.5 meters) tall and weigh up to 50 tons. Altars, carved rectangular blocks with sculpted details, may actu-

ally have served as thrones. Often the sculptural element depicts an individual emerging from a niche or cave, sometimes holding a small prone figure in its arms. These pieces range in weight up to 40 tons. Other repeated themes in Olmec sculpture include jaguars and serpents as well as early depictions of deities associated with rain, maize, and the moon. The earliest examples of numbers and name glyphs also appear in Olmec sculpture.

In general, Olmec depiction of human and other anthropomorphic figures is characterized by several stylistic elements. This includes a tendency toward full, rounded features: round faces sometimes with jowls and fat or pudgy limbs and belly. Lips are also depicted as full or slightly turned out. Eyes are often hollow, and hollow earspools decorate elongated earlobes. Heads are distinctively flattened and elongated, suggesting a practice of cranial modification. Pronounced clefts in the top of the head of some figures may refer to a second form of cranial modification or represent a variant depiction of the maize deity, usually shown with an ear of maize sprouting

from a furrow in the head. Though chronology of Olmec style has been difficult, recent studies suggest that in general Olmec art, especially stone sculpture, tended to move from full, round figures to those cut in low relief.

Materials favored by Olmec artists varied and suggest a degree of craft specialization for at least some artisans. The Olmec favored white kaolin clay for figurines and ceramic vessels. Green stone such as jade, jadite, or serpentine were favored for small sculptures like stone celts. The Olmecs cut and polished magnetite to make mirrors. Olmec artists carved monumental art—heads, altars, stelae, and other freestanding sculptures—from volcanic stone brought from the Tuxtla Mountains in the Olmec heartland.

Chavín Style Horizon

The term "horizon" was coined in pre-Columbian Peruvian studies to define periods of shared stylistic features across a broad expanse of the Andean region. The Chavín style horizon arguably remains the most enigmatic of these phases, defining the first Pan-Andean visual program. This early stylistic horizon is presumed to have re-

sulted from the spread of a highly influential religious cult throughout the Andes and coast during the Formative period (1800–200 BCE). Its spatial breadth and influence are generally defined by the sites and material culture that share in the style found at the site of Chavín de Huántar, in the north-central Andes of Peru. Numerous stone sculptures once decorated the monumental facades of this ancient site. These elaborate sculptures as well as the ceramic styles associated with the early settlement at Chavín readily compare with contemporary sites throughout the Andes and coast. As such, these features have served to define Chavín de Huántar as the matrix of early pre-Hispanic Peruvian cultures.

The Chavín style horizon may be defined in formal terms based on the sculptural designs and their representations. Drawing upon literary parallels, Chavín style may be identified through its vocabulary (the visual elements and their progressive forms and design) or its grammar (manners of representation). The visual elements that often define Chavín style include pendant eyes, mouths with interlocking fangs, agnathic mouths, mouth bands, serpent forms, geometric markings, etc. These features regularly appear at the joints or body parts of larger idealized images. Based on a presumed literary parallel in Norse poetry, these applied and substituted features—for example, a serpent appearing as the whisker of a larger idealized feline figure—have been called kennings. The presence of such visual kennings in a representation serves as a key identifying feature of Chavín style.

The manners of representation, however, are also used to identify Chavín style. These consist of representing figures through bilateral symmetry, modular width, anatomic design, or contour rivalry. Anatomic design occurs when an object creates an equally legible image when rotated 180 degrees from the original design. Contour rivalry is a manner of representation in which an image may be read both frontally as one object and in profile as two opposing figures. Such visual modes presumably become more formalized, repetitive, and angular throughout the Chavín stylistic sequence. They appear in regions throughout the Andean coast and sierra in various media such as gold, textile, shell, and ceramic. The manners of representa-

tion thus have a considerable developmental history and distribution. They interact with local styles and systems of representation within a broad spatial and temporal range.

The ceramic styles that correspond to the monumental phase at Chavín de Huántar reflect a similar breadth of distribution and interaction with outside regional styles. Along with other identifiable cultural features, they may provide a key set of materials for further demarcating the Chavín horizon. Indeed, it is the cross-comparison of these data sets, visual style, and material culture that may present the most valuable tool for examining this enigmatic early Andean horizon.

➤ CHAVÍN DE HUÁNTAR

Avian figure cornice sculpture from Chavín de Huántar, Peru. (After Rowe 1977, figure 11)

This black-and-white reproduction is of a granite sculpture from the east (frontal) facade of the largest building at Chavín de Huántar, Peru. Stylized faces occur at numerous points within the larger avian image, which is identified by its prominent beak, wings, and talons. The torso displays a central face (two symmetrical eyes, nostrils, upturned mouth curls), which may also be read as two opposing profile faces. This is a clear example of contour rivalry.

—Kimberly Jones

■ Introduction: Death and Dying

The period from 1000 BCE to 300 CE can well be designated a Classical period in regard to world understandings of death and dying, as this is the period in which much of the world's current beliefs on this subject were established. This is when Christian beliefs in the afterlife originated and a period in which Jewish beliefs regarding death and dying became recognizable in regard to beliefs still held today. Buddhist conceptions of reincarnation and nirvana arose in this time, as did many of the other traditions that inform East and South Asian funerary practices today.

While Greek and Roman beliefs about what happens after death have not lasted until the

present day, much of the modern architecture for the dead is based on Greco-Roman traditions. The mausoleums and funerary monuments that could be found on the outskirts of a Roman city (the Romans normally forbade the burying of the dead within city limits) influenced the construction of monuments throughout later European history.

In other regions, funerary traditions continued on in much the same way as they had in previous periods. Egyptian mummification continued, although by the time Romans controlled the Nile Valley the Egyptian practices had merged with various Hellenistic beliefs. Throughout northern Europe and central Asia, a variety

of approaches to treating the dead continued to be used. The two most prominent were cremation of remains and the internment of bodies in large funerary mounds (known in eastern Europe and Asia as *kurgans*). Chinese funerary practices in this period also continued some of the traditions established in earlier periods. Elaborate bronzes continued to be used in funerary customs as they had been used in the previous Shang dynasty (1766–1122 BCE). Perhaps most notable is the final resting place of the Qin emperor and his elaborate terra-cotta army.

Burials of the Kings and Queens of Kush

Kushite kings and queens were buried in two types of monument: the tumulus and the pyramid. The tumulus refers to a mound of earth (of varying size), often outlined by stone blocks, that covers a burial chamber dug directly into the ground. The pyramid is a well-known Egyptian burial monument, but the Kushite version is of much smaller size—rarely more than 98 feet (30 meters) in height—and its angle is much steeper.

THE TREASURE OF AMANISHAKHETO

By the nineteenth century, most Kushite royal tombs had been robbed except that of the kan-dake (ruling queen) Amanishakheto. Her pyramid in the Northern Cemetery at Meroe (Pyramid N6) remained virtually intact until 1834. That year an Italian physician named Giuseppe Ferlini explored Meroe. Unfortunately, in his search for gold he completely dismantled several well-preserved pyramids, yet only that of Amanishakheto yielded treasure.

The discovery included beautiful Meroitic jewelry—necklaces, bracelets, ear studs, and rings—as well as bronze bowls and a wooden funerary bed. Amanishakheto's treasure is now displayed at the Egyptian museums in Berlin and Munich.

—Caroline M. Rocheleau

The tumulus was part of centuries-old burial traditions in Nubia prior to the rise of the Kingdom of Kush. The earliest of all tumuli were circular, but rectangular ones also existed, supposedly to make easier the construction of the abutting chapel, where offerings to the deceased were made. The burial chamber included grave goods, which were much simpler than those found in Egyptian tombs and consisted of pottery vessels, weapons, tools, and jewelry. Following earlier Nubian traditions—found in the early tumuli at El-Kurru—the body of the deceased was placed on a wooden burial bed. The tumulus itself blocked the access to the burial chamber; therefore, the tumulus could only be built after the burial took place.

The earliest kings of the Napatan period (before King Piye) were buried in such tumuli at the site of El-Kurru, a cemetery on the east bank of the Nile, downstream from Gebel Barkal. The Kushite rulers, however, soon abandoned the tumulus grave in favor of the pyramid and Egyptian burial practices: mummification, anthropoid (human-shaped) coffins (supported by a stone bench, not a wooden bed), occasional stone sarcophagus, and canopic jars, for example. King Piye may have been the first Kushite ruler to build a pyramid, although too little is left of the superstructure of his tomb to effectively distinguish it from a large rectangular tumulus. The earliest pyramids are at El-Kurru, but there are also royal pyramid fields at Nuri and Gebel Barkal (near the Fourth Cataract) as well as Meroe (downstream from the Sixth Cataract).

Kushite pyramids could be built in two ways: by laying down rows of masonry blocks or creating a revetment (exterior casing) and filling it with rubble. The construction of chambers inside pyramids was therefore impossible, although Ferlini claimed to have found Amanishakheto's treasure in such a room. The pyramid was also fronted by an offering chapel (on the east face) and was built over the underground burial chamber. Unlike the tumulus, however, the pyramid did not always block the access to the burial chamber. A descending passageway (sometimes with steps) dug into the bedrock led down to the burial chamber. This indicates that the pyramid and the burial chamber could be built before the

burial took place. After the funerary ceremony, the chamber was sealed, and the passageway was completely back-filled.

Both tumuli and pyramids were also used by the nobility and important individuals, but on a smaller scale, throughout Kushite history.

Etruscan Funerary Monuments

Most information about Etruscan civilization on the Italian peninsula (seventh century to second century BCE) comes from graves. The grave was the place where the dead survived in the living world, which is why the Etruscans took particular care of them.

The earlier Villanova Civilization (eighth century BCE) produced handmade biconical urns decorated with incised geometric motifs to contain the ashes of the dead after cremation. A bowl for women or a helmet for men covered these urns. Another type of urn is in the shape of a hut.

Throughout the sixth century BCE the Etruscans used canopic jars (so-called after similar Egyptian examples) with a lid in the form of a human head and sometimes with the addition of arms at the level of handles, humanizing even more the egg-shaped vase. These were for cremations and were placed in a larger clay vase and then buried in the ground or sometimes just placed on a model throne in tombs.

Beginning in the seventh century BCE chamber tombs designed with several sepulchral chambers, probably imitating the forms of wealthy houses, were built to contain a whole family over several generations. At Cerveteri monumental circular graves up to 165 feet (50 meters) in diameter covered with a tumulus (mound) of soil indicate the importance of the families buried there.

Pyramids of the North Cemetery at Meroe. (Caroline M. Rocheleau)

THE SARCOPHAGUS OF THE MARRIED COUPLE

During excavations at Cerveteri in 1845, a sarcophagus of polychrome terra-cotta that was made for an elite couple during the archaic Etruscan period (530–510 BCE) was discovered. The artistic motif on the sarcophagus of a couple reclining at a banquet and the treatment of the figures likely reflect the influence of sixth-century BCE Greek art. The woman is about to pour some drops of perfumed oil onto the palm of her husband's left hand as part of the funeral rites. The couple's slightly ironic smiles, their distant glance, and the presence of a wineskin (under the left elbow of the diners) and perfume vessels symbolize the dead couple's hope for a life of eternity. Here the wife is placed on the same level as her husband, indicating that a woman's social status was higher in Etruscan than in Greek society.

—*Marie-Luce Muracciole*

The tombs at Tarquinia include well-preserved paintings on the walls that provide information concerning Etruscan social life, customs, and beliefs. In the "Tomb of the Hunter," a clever painter's device transforms the interior of the tomb into a hunter's tent, a vivid evocation of aristocratic values on the part of the tomb's owners. The recurrent subject matter remains the banquet, for which there are two interpretations: the funeral banquet, which took place after the burial, or the everyday banquets that reveal the lifestyle of the upper classes.

In the third and second centuries BCE, despite the drastic decline of the south, the northern cities kept up production of funerary art for the use of aristocracy. Volterra has provided the most important collection of funerary urns in alabaster and travertine. Both sarcophagi and urns represent the deceased richly dressed, reclining on a dining couch, the men holding a phiale (a shallow bowl) or a writing tablet and the women holding a fan. The face of the sarcophagus is often decorated with scenes of dancing, with mythological allegories, with funeral banquets, or frequently with journeys in a carriage representing the departure of the deceased toward the underworld.

Greek Funerary Customs

In the Greek world, death was prevalent among persons of all age groups, whether as a result of warfare, accident, or illness, or, in the case of women, as a consequence of giving birth. It was incorporated into the life of the community to a degree that would strike many people today as morbid.

Although we occasionally hear of undertakers, known as *klimakophoroi* or “ladder bearers,” *nekrophoroi* or “corpse-bearers,” and *tapheis* or “buriers,” the duty of these hired hands consisted merely in transporting the corpse from the house to the grave and preparing the ground for burial. They were not, for the most part, specialists but merely odd-job men. Nor did they attend to the corpse’s needs prior to its departure from the house, as modern undertakers do. Everything suggests that the Greeks would have regarded the idea of handing over the corpse of a dead relative to strangers as offensive and incomprehensible.

This attitude had much to do with the belief that in the period between death and burial the

deceased are in need of the solicitous attention of their relatives. Until inhumation or cremation has taken place, the dead were thought to be in what anthropologists describe as a liminal stage—a word that derives from the Latin word *limen* meaning “threshold.” They were between two worlds, having not yet fully disengaged from this one while awaiting incorporation into the next. Entry to Hades, the world of the dead, did not occur automatically but was the consequence of strenuous activity on the part of the living. This betwixt and between status was regarded as extremely perilous, for which reason the unburied dead were believed to be at considerable risk. The primary obligation upon the living was thus to perform the burial as expeditiously and efficiently as possible. To fail in this sacred duty was to condemn the dead to wander up and down the banks of the River Styx, which surrounded Hades, for thousands of years.

Unlike many modern cultures, which encourage the presentation of a stiff upper lip in the face of loss, Greek culture not only tolerated but also expected highly demonstrative manifestations of grief. There are frequent references in literature to men and women tearing out their hair, rending their garments, beating and lacerating their breasts, rolling on the ground and wallowing in the dust, and going without food or drink for several days. This kind of behavior was prompted in part by a desire to honor the deceased, who were believed to take pleasure in witnessing the exaggerated displays of grief that their death occasioned.

No ritual was treated with more importance than that of burial. A popular view quoted by Plato (*Hippias Major* 291de) was that the best thing of all for everyone was “to be rich, healthy, honored by one’s fellows, reach old age, and, after burying one’s parents well, to be laid out well by one’s own children and be buried in magnificent style.” The Greek funeral, like our own, was a three-act drama. This comprised the laying out of the body in the home (*prothesis*), the funeral cortege from the home to the place of burial (*ekphora*), and the burial.

The prothesis was performed by the female relatives of the deceased. At the moment of death, the deceased’s eyes and mouth were closed. A chin strap was commonly tied around

the head and chin to prevent the unsightly sagging of the jaw. The body was washed, anointed in olive oil, clothed, and wrapped in a winding sheet. Finally, it was laid out on a couch with its head propped up on a pillow and its feet facing the door. This last practice, which seems to be nearly universal, has given rise to the expression about carrying someone out “feet first.” From the fourth century BCE onward, there developed a tendency to dress the dead more ornately, sometimes even to place a crown made of gold foil on the head, whereas in earlier times a simple wreath of ivy, laurel, or olive sufficed. When the body had been laid out, relatives were permitted to view the deceased and dirges were sung.

On the day of the funeral—which, in Athens, had to take place within three days of the death—the mourners accompanied the corpse to the place of burial. Some corpses were laid in a simple wooden coffin. However, because of the scarcity of wood, the poor had to make do with only a winding sheet, strewn with a few branches. The corpse was either borne by pallbearers or transported in a cart to the grave. The Athenian lawmaker Solon (ca. 640–560 BCE) regulated that a corpse had to be transported from the house before sunrise to avoid unseemly displays of grief that could cause a public nuisance and draw too much attention to the family.

The Greeks had no conception of a necropolis in the literal meaning of the word (though necropolis is, of course, a Greek word)—a city of the dead that is separate from the living. Those who dwelled in the country tended to bury their dead in a field on their estates, while city dwellers buried the dead beside a main road. The highways leading out of Athens were lined on either side with tombs, in much the same way that advertising billboards clutter the sides of our highways today. The most frequented roads provided the most favored burial spots for wealthy families, as indicated by the number of tombs located on the west side of the city in the area known as the Kerameikos or Potters’ Quarter.

Expenditure on the dead came very high on the list of a rich citizen’s financial priorities. We hear, for instance, of one family tomb erected in the final decade of the fifth century BCE that cost at least 2,500 drachmas, although the defendant actually claims that the true figure was

➤ FESTIVALS IN HONOR OF THE DEAD

Festivals in honor of the dead formed a major feature of the calendar. The most spectacular was the annual ceremony held in honor of the war dead. Known as the *taphai*, or burials, it took place at the end of the campaigning season in early winter. Other festivals in honor of the dead include the third day of the Anthesteria, known as the Chytroi, or Pots, which was so named because pots of porridge were offered on that day. Chytroi, in other words, was the Athenian equivalent to All Souls’ Day, when the souls of the dead left their graves and wandered abroad. To counter their noxious presence, people would chew buckthorn and smear the doors of their houses with pitch. The dead were also celebrated at the Genesia and Nemeseia. The Genesia was in origin a private ritual celebrated on the birthday of the deceased, though under Solon it became a national festival. The Nemeseia (derived from *nemesis*, meaning vengeance) took place at night and was intended to placate those who had come to a violent end.

—Robert Garland

twice that amount (Lysias, *Against Diogeton*, 21). This was at a time when a rower in Athens’ navy earned merely one drachma per day. Grave monuments increased in elaboration as the fourth century progressed and remained in vogue until 317 BCE, when Demetrios of Phaleron introduced legislation severely limiting their costliness, evidently to curb unnecessary expenditure in a period of economic decline. Henceforth, the commonest form of grave marker was a simple marble column known as a *kioniskos*, some 2–3 feet (0.5–1.0 meters) in height above the ground and about 1 foot (0.3 meters) in diameter. The great age of honoring the dead with sumptuous monuments was over.

Bereaved relatives continued to maintain a close attachment to the deceased long after death had occurred, because their welfare in Hades was thought to depend on the attention they received from the living. Women were expected to pay regular visits to the grave, particularly on the anniversary of the day of death but also at other intervals throughout the year. Because the dead were believed either to dwell in the

proximity of their grave or at least to be capable of visiting it periodically, a variety of gifts judged necessary for their physical welfare were buried with the dead and deposited periodically afterward beside the tomb. The most common grave gift in fifth-century Athens was the oil flask or *lekkythos*, which was decorated with images relating to the care of the dead set against a white background. Common objects that were deposited at the tomb include branches of myrtle, wreaths, cakes, and drink. It was also customary to anoint gravestones with olive oil and wind colored sashes around their shafts, almost as if gravestones in some sense embodied or ensouled the dead.

Roman Funerary Practices and Monuments

Death was an important event in ancient Rome. It was essential to have a proper funeral, and the very worst thing for a Roman was to die under catastrophic circumstances and have his or her body lost. When this occurred, an empty tomb, a cenotaph, might be erected. Otherwise, Romans would be either buried or cremated. In a cremation the ashes of the deceased were placed in an urn in the tomb, while for burial the body was laid in a sarcophagus, a kind of richly decorated stone coffin.

It was forbidden to bury the dead within the sacred confines of the city according to the ancient Law of the Twelve Tables (quoted by Ci-

cero, *De Legibus*, II, 58). Cemeteries extended along the roads beyond the cities' gates (e.g., the Via Appia at Rome), and monumental design was governed by strict conventions. The tomb was the way an individual highlighted his personal beliefs and indicated his role in society. There was a great variety among tombs; some were impressive buildings while others were simple graves nearby consisting of amphoras stuck in the ground, the mixture of social categories typical of the Roman empire in life repeated in death.

Inscriptions on tombs recalled both the identity of the deceased and his family's grief. Ideally, a monument was placed on a frequently traveled road so that by reading his name passersby might confer on the deceased a kind of momentary survival. Inscriptions often called upon passersby by means of a formula such as "remember X, you who read this."

Petronius's *Satyricon* tells us much about Roman funerary customs, including the fact that a grave was often constructed in the lifetime of the intended occupant. The rich former slave Trimalchio provided precise instructions concerning the decoration and size of his funerary monument. It was to enclose a space 100 feet wide on the facade and 200 feet deep (approximately 30 by 60 meters). This was exaggerated for comic effect; the usual enclosure might measure only 39 square feet (12 square meters). Trimalchio was also very particular with regard to his heir, who was not to repossess his grave. Similar injunctions occurred frequently in wills and are often inscribed on the facades of monuments (as at Isola Sacra of Ostia). Heirs might otherwise sell a grave in order to make a profit and to avoid paying for upkeep.

Old families had relatively modest graves, but the newly rich often constructed conspicuous tombs to advertise their social success, such as the extravagant grave in the form of an oven of the baker Eurysaces near the Porta Maggiore in Rome.

Roman funerary art was imaginative and included tombs in the shape of round towers, temples, vaults, and simple gravestones, altars, or sarcophagi carved with mythological scenes. Imperial tombs stand a little apart but reflected contemporary practice; they were the burial places of personages who had distinguished

➤ SARCOPHAGUS OF ARIADNE AND DIONYSUS, MUSÉE DU LOUVRE, PARIS

The Sarcophagus of Ariadne and Dionysus is a marble sarcophagus of the third century CE, made in Rome but found in Saint-Médard-d'Eyrans in France. It is a beautiful example of Severan art. The myth of Ariadne rescued by Dionysus on Naxos lends itself to a funerary interpretation and to the hope of eternal life. The detail of the craftsmanship illustrates how sarcophagi were made. The craftsman would make a certain number, leaving the head of the intended occupant unfinished; a portrait would then be made at the time of purchase.

Early Christian Funerary Monuments

The funerary monuments of early Christians (first to third centuries CE) took the form of catacombs. The catacombs of ancient Rome include more than 60 underground burial sites that house Christians, pagans, and Jews. Christians naturally favored burial over cremation, given the belief in bodily resurrection on Judgment Day. These cemeteries reflected diversity in religion as well as social status and housed families, martyrs, and popes. The purpose and use of the catacombs transformed over time, often over centuries, with the addition of layers of tombs.

Beginning in the second century CE, the catacombs were built as a response to a shortage of land, overcrowding, and, particularly for Christians, the need to bury their dead privately due to widespread persecution. Roman catacombs were

typically located along roads outside of the city limits (Roman law did not permit burial within cities) and are named for martyrs buried there.

The soft volcanic earth of ancient Rome proved suitable for tunneling. Roman excavators built complex systems of passages on top of each other. Narrow steps joined each level, and individual catacombs were built with as many as four stories. Bodies were clothed, bound in linen, and placed into stone sarcophagi that were then situated in the narrow chamber walls of the catacombs. The niche was sealed with marble or terra-cotta and sometimes inscribed with the person's name, age, and death date.

Early Christians, similar to the early Etruscans and pagan Romans, memorialized the tombs of their loved ones with decorative arts. The front of the sarcophagus might include personalized portraits on shields or medallions, with reliefs depicting the tales of biblical figures and the miracles of Jesus displayed beneath them. Symbols of the cross were uncommon during the first three centuries of the Christian Church. The Romans' persecution of Christians during this time, especially during the reign of Emperor Decius in 250 CE, made it unlikely that Christians would have been comfortable displaying crosses and thus revealing their faith. Instead, crosses might have been disguised as the masts of boats, anchors, the Greek letter "chi," or St. Andrew's cross (an "X"). Other crypt adornments were the Ichthys (or Ikhtus), the ancient Greek word and symbol for "fish," commonly accepted as a universal symbol of

➤ FRESCOES IN THE SAINT PRISCILLA CATACOMBS

Some of the earliest surviving frescoes displaying Christian themes are found in the catacombs of Saint Priscilla, dating from the second century CE. In one of the oldest parts of the cemetery, the ceiling is decorated with several frescoes including the Good Shepherd, a symbol of Christ, and one of the oldest images of the Madonna and Child. The catacomb's Capella Greca (Greek Chapel) houses the fresco titled *Fractio Panis* that depicts a group of six men and one woman breaking bread around a table. Joseph Wilpert, a Jesuit art historian, discovered the fresco in 1893, delicately removed the crusts covering the surface, and published his account in 1895.

—Kim Kennedy White

Jesus Christ, and the Chi-Rho, the first two letters of “Christ” in Greek (XP).

The earliest and most well known of the catacombs used by Christians prior to the fourth century include the catacombs of Domitilla and San Callisto. The catacombs of Domitilla are among the oldest and house frescoes depicting biblical themes dating from the second century CE. It was also during the second century when San Callisto (named for St. Callixtus) became the official catacomb of the Roman Church where more than 50 martyrs and 16 popes, among others, are buried. San Callisto is one of largest catacombs, containing around 500,000 tombs.

Following the Edict of Milan, signed by the emperors Constantine and Licinius in 313 CE proclaiming religious toleration, the persecution of Christians decreased, and the practice of catacomb burial declined in favor of Christian Church cemeteries.

Jain and Early Buddhist Funerary Monuments

According to Buddhist scriptures, after the death and *parinirvana* (the ultimate goal of Buddhist practices) of the Buddha, his body was cremated. A group of his lay followers, the Malla clan, then gathered his bones and ashes with the intention of building a stupa over them. The Mallas were challenged by seven other groups of lay Buddhists from various cities who also wanted to honor the Buddha's relics. A wise Brahmin divided the Buddha's bones and ashes among these eight rival groups, and each group built its own stupa in honor of the Buddha.

What is a stupa, and why should the Buddha's lay followers want to build one over his physical remains? A stupa is a dome-shaped funerary monument that encloses the remains of an important person. In ancient India, by the Buddha's time (roughly the fifth century BCE), the practice of cremating corpses had already become the norm. In Hindu practice, the ashes of the deceased are typically scattered over a sacred body of water, such as the river Ganga (Ganges) or are placed in a clay bowl that is then sent down the river. However, the remains of holy men (*sannyasis* or *sadhus*) are often not cremated but instead are buried and are frequently placed at the foundation of a sacred site, such as a temple or monastic complex.

Buddhist practice in ancient India seems to have been a blend of Hindu practices with regard to the remains of both laypeople and ascetics. Like the physical remains of a layperson, the remains of the Buddha were cremated. However, sacred monuments were then erected over these remains and became sites for Buddhist pilgrimage and worship.

The shape of the stupa is suggestive of even more ancient Indo-European burial mounds, and the practice of placing the remains of an impor-

THE GREAT STUPA AT SANCHI

In ancient India, devotees would enter the large gate and walk around the stupa clockwise (a practice called circumambulation), careful to keep the stupa to their right side. Sacred Hindu and Buddhist icons are revered in this way to the present day.

—Jeffery D. Long

(Nitya Jacob)

tant person in a dome-shaped monument may have been derived from the Indo-European practice of burying kings and warriors beneath earthen mounds. The fact that royal imagery, such as an umbrella and a throne, is also connected with the stupa reinforces the notion that by having his remains placed in a stupa, the Buddha is being accorded regal honors.

From a Buddhist philosophical perspective, the stupa is a bit of a paradox. On the one hand, according to the Buddhist scriptures, the Buddha commanded his disciples not to mourn the death of his physical body or to have any great regard for it at all, saying that his true body, his true remains after his death, would consist of his teaching. On the other hand, the practice of erecting stupas over the physical remains of the Buddha and of other Buddhist saints during the ancient period suggests an attachment to those remains or at least to the person whose remains they are. The erecting of stupas can be seen as an early step in the direction of a devotional form of Buddhism, emphasizing not only the practice of the Buddha's teachings but also love for and attachment to the person of the Buddha himself (as well as other early Buddhist saints whose remains were similarly entombed).

Jains as well as Buddhists placed the physical remains of their saints, the Jinas, in stupas during the ancient period. The most famous Jain

stupa is located in the northern Indian city of Mathura, a site sacred to Jains, Buddhists, and Hindus alike. The most famous Buddhist stupa is at Sanchi in central India. Both stupas were re-discovered by archaeologists in the nineteenth century after centuries of disuse.

Construction of the Tomb of the First Emperor of Qin

Excavated in the 1970s, the building of the tomb of Qin Shi Huang, or the First Emperor, is presently located about 3 miles (5 kilometers) east of Lintong County of Shaanxi Province. The building of his burial compound was initiated by and for the First Emperor after he was enthroned and was expanded after his unification of China in 221 BCE until the time when his dynasty was deposed. "According to the *Records of the Grand Historian* by Sima Qian, 700 workers

allegedly labored upon this unfinished construction project for a period of over 30 years.”

The mausoleum was planned as a rectangle encircled by two layers of earth-pounded walls. The inner walls are oriented north and south about 4,445 feet (1,355 meters) long and east and west about 1,900 feet (580 meters) wide. The outer walls are oriented north and south about 7,100 feet (2,165 meters) long and east and west about 3,080 feet (940 meters) wide. The tomb, built with pounded earth, is in the southern part of the inner walls. The extant lower part of the tomb was formed as a square, with each side 1,150 feet (350 meters) long and 240 feet (73 meters) high. The tomb, a pyramidal construction yet with a flat upper platform about 80 feet (24 meters) long and 34 feet (10 meters) wide, was not able to survive time completely. Under the pyramidal tomb is the underground palace where the First Emperor was buried. The underground palace is a squarish construction about 1,500 feet (460 meters) long and 1,300 (400 meters) wide. Three paths leading to the palace underneath the ground were found in the east, west, and north of the tomb, respectively. Two painted bronze chariots were excavated in the west path, each of which was drawn by four bronze horses reined by a bronze charioteer.

In the northern part of the inner walls a large-scale palace compound was constructed. In the east, west, and south sides of the inner walls, where some porchlike buildings were built attached to the inner walls, ceramic food and drinking vessels were found, and some of them bear inscriptions. Toward the west of the mausoleum there are tombs for those who died for its construction and workshops in which stone, bricks, tiles, and other materials were prepared for the buildings. To the east, finds included 17 tombs of princes, princesses, and close subordinates of the First Emperor and pits of horses buried alive as well as terra-cotta soldiers and terra-cotta horses. The terra-cotta soldiers and horses are the most well-known finds from the site.

The pits of terra-cotta soldiers and horses are located about 1 mile (1.5 kilometers) east of the First Emperor's mausoleum. This complex includes four pits. The No. 1 pit has been fully unearthed, the No. 2 and No. 3 pits have been partly excavated, and the No. 4 pit was aban-

doned during construction. In an area occupying 28,955 square feet (2,690 square meters), 2,200 terra-cotta soldiers, 32 chariots, and 157 terra-cotta horses have been excavated. Experts estimate that several thousand more terra-cotta soldiers and several hundred more terra-cotta horses are still buried in the unexcavated parts of the pits. Such an astonishing discovery provides invaluable information on the Qin Army arrangement, equipment, warfare, and even plastic arts.

Chinese Burials of the Han Periods

The Han periods witnessed the epochal change of the early Chinese burial system. The landmark was that the Han people adopted horizontal caves instead of vertical pits as the tombs for the dead, which both in building materials and in forms were imitations of the houses of the living. Such a change first happened in the middle of the Western Han period in the Yellow River drainage area and then expanded over time to the northern frontiers and the Huai River and Yangtze River valleys. However, in some places, especially in the northern and southern frontiers, the high-ranking officials and landowners chose the Zhou burial system characteristic of strict differentiation among different social classes. Therefore, they used vertical pits and wood coffins for the dead from the Western Han period (207 BCE–9 CE) until early in the Eastern Han period (25–220 CE).

The horizontally oriented tombs had different styles. The most common style was an earthen cave, small in scale, that lacked complicated structure, and the occupiers were usually small landowners in the Yellow River valley and

northern areas. Such a style remained popular in these areas beyond the Eastern Han period. Some aristocrats built their tombs into cliffs, which were called cliff tombs, the representatives of the horizontally oriented tomb style popular since the middle of the Western Han dynasty. During the middle and late Western Han periods, a kind of brick-made tomb appeared in the central plain and Guanzhong areas. It soon became popular during the Eastern Han period. The brick-made tombs for the aristocrats and high-ranking officials usually imitated their house compound and thus consisted of complex structures and beautiful frescoes. Stone tombs also came into existence in the Western Han and continued to the Eastern Han period. On the stone walls of some of the stone tombs, both realistic and mythical figures, plants, and animals were carved or painted. During the Western Han, the kind of tomb made of air bricks (bricks that are hollow in order to facilitate ventilation) was fashionable in the Central Plain area. However, it gradually faded out of history until the Eastern Han period. In the Sichuan basin, some of the brick-made tombs also bore carved figures on bricks.

Compared with previous periods, fewer bronze but more lacquered vessels and objects were found in Han tombs. Large ceramics also appeared among the buried vessels. In the Western Han, the main objects buried with the dead were utensils of daily use; after the Western Han, vessels, objects, and models of constructions made exclusively for burial, which are called *mingqi*, came onto the stage. This was another dramatic change in the early Chinese burial history. The main kinds of *mingqi* included wells, mills, kitchens, barns, dogs, pigs, and chickens, to name a few, and both the sorts and number increased in the Eastern Han tombs. In the Eastern Han period, real chariots and horses buried with the dead were also gradually replaced by wood or ceramic models. Few examples of human victims buried alive with the dead can be found in Han tombs because, according to the Han laws, using human beings as victims in burial was illegal. As a result, wood and ceramic servant figures were also included in *mingqi*.

A large Han tomb usually included an underground grave, a mount on the grave, a memorial

temple constructed in the front of the mount, a que building (freestanding tower) before the tomb, stone statues of animals, and stele. The Han imperial mausoleum was usually planned as a square and was walled, with a gate in each of the walls and double que buildings outside each gate. The Han emperors and empresses were buried together but had different mausoleums. Accompanying their husbands, the Han empresses usually had much smaller mausoleums beside those of the emperors.

Hsuan-Nu and Scythian Kurgan Burials

The Eurasian steppes have been occupied by a variety of nomadic tribes from circa 900 BCE to the present day. The term "Scythian" is used in this entry to indicate horse-riding Indo-Iranian or Indo-European nomads who lived on the Eurasian steppes from circa 900 BCE until 300 CE. These nomads are also characterized by their distinctive animal style art. The term "Hsuan-nu" is used to collectively refer to horse-riding nomads of Asiatic ancestry occupying present-day Mongolia, northern China, and southern Trans-Baikal from circa 250 BCE until circa 200 CE.

One of the oldest Scythian-style burial monuments is Arzhan (Arjan) in the Sayan Mountains of Tuva. Radiocarbon determinations place its construction at around 850 BCE. The main mound at Arzhan was nearly 394 feet (120 meters) in diameter. The mound itself was made of earth and stones over a series of wooden chambers. Inside were the remains of more than 100

horses, several individuals, and a rich assemblage of bronze artifacts. Given its size and the number of horses in the tomb, Gryaznov, the excavator, believes that this was the tomb of a king.

The oldest Scythian-style burial in the Black Sea region is barrow 15 of the Steblev group. Both typological and radiocarbon dating dates this tomb to the early eighth century BCE.

The relationship, if any, between the Scythian monuments in central Asia and those in the Black Sea region are debated. The only consensus is that the Indo-European and Indo-Iranian nomads occupied the Eurasian steppes when the climate became cooler and wetter than it is today. The increased rainfall made more pasture for their animals, and their dependence on sheep, goat, and cattle for subsistence enabled them to settle areas that were marginal to agriculture.

The most celebrated complex of Scythian burials is at Pazyryk in the Altai Mountains.

Pile carpet depicting horses and riders, fallow deer and griffins, from the Pazyryk Burial Mounds, fifth–fourth century BCE. (Hermitage, St. Petersburg, Russia/The Bridgeman Art Library)

These barrows consist of a stone cairn over a grave shaft leading to a wooden burial chamber. What made these and other tombs in the Altai so unique is that ice formed in them and froze the contents. Despite being robbed in antiquity, these naturally refrigerated tombs yielded a rich assemblage of wooden artifacts, textiles, leather objects, and other organic materials. Even the tattooed skin of the dead in barrows 2 and 5 was preserved. Sergei Rudenko excavated the first barrow in 1929, with the other seven being excavated by Rudenko between 1947 and 1948.

Barrow 2 is the oldest of the tombs at Pazyryk and has been radiocarbon dated to circa 450 BCE. The most recent barrow (barrow 6) dates to circa 250 BCE. Despite being nomads, the people at Pazyryk had a rich material culture and were part of an active trade network. Felt and wool carpets, elaborately carved wooden figures, and bronze tools and weapons were found in the barrows. Silk and Chinese bronze mirrors were found in barrows 3, 5, and 6. Glass beads, possibly from Southeast Asia or the Near East, were also contained in the tombs.

Other frozen tombs were found in the nearby Ukok plateau in the 1990s. One of the tombs excavated by N. Pilsomak is believed to be that of a priestess or shaman. Her burial occurred sometime during the fifth century BCE. Her clothing, elaborate headdress, and other organic materials were all preserved. Other grave goods included a silver mirror, glass beads, wooden serving bowls and ladles, and six horses.

Catacomb tombs were popular among the Scythians of the Black Sea region during the fifth century BCE. Before the earthen mound was built, a descent shaft and chamber were dug into the ground. The descent shaft did not lead directly into the burial chamber but instead led into an anteroom or short corridor. The burial chamber was beyond this small room or corridor. After the placement of the body or bodies, the descent shaft was filled in, and the mound was constructed. At a later date, many of the mounds had a secondary burial placed in them. Unlike their Eastern counterparts, the Black Sea Scythians did not place the body in a wooden coffin. Some of the larger Scythian cemeteries are outside of Neapolis Scythica in the Crimean peninsula and in Georgia along the Kuban River.

The Hsuan-nu confederacy existed from approximately 250 BCE to 200 CE. This confederacy of nomadic tribes ruled the areas of present-day Inner Mongolia, Mongolia, and the southern Baikal/Transbaikal region. In most cases, a small ring of stones around the grave shaft demarcates Hsuan-nu burials. The burial chamber was usually paced about 3 feet (1 meter) below the surface. Burial was usually in a wooden coffin, which was often contained in either a stone chamber or wooden chamber.

One of the most famous Hsuan-nu cemeteries is Noin-Ula in central Mongolia. This cemetery consists of more than 200 burials that are marked by a low rectangular-shaped mound over the grave shaft. The area of the mound ranges from around 32 square feet (3 square meters) to more than 3,230 square feet (300 square meters). During 1924 and 1925, P. K. Kozlov excavated five tombs in this cemetery.

The burial chambers of the tombs excavated by Kozlov were all below the water table. The water-logged conditions were conducive to the preservation of the wood, textiles, and other organic materials placed in the tombs. Wood was used for the construction of the burial chambers. A rich assemblage of wool, felt and silk textiles, and Chinese lacquerwares were found in these tombs. The inscription on a lacquered bowl from Tomb No. 6 dated the tomb to the first century CE and suggests that it is the tomb of the Hsuan-nu Shanyu, Wu-chu-lü.

Textiles as Marks of Status in Central Asian Burials

Central Asian grave goods offer us a glimpse of the daily life and belief systems of the dead, particularly through the remains of textiles regarded as highly important by people of the region. Burial finds in general denote the social status of the occupant in life. Gold, silver, jade, precious stones, fine metalwork, and ceramics can stand the test of time, but organic materials such as textiles are often destroyed by the elements. In central Asia, however, the extremely dry conditions have preserved many textile remains.

Before 300 CE, silks in central Asia were at a premium. Expensive and rare, they were accessible in quantity only to the wealthy. By way of comparison, it is useful to look at a Chinese grave of approximately the same period. Here the lavish amount of silk points to a wealthy noble person but also points to a far greater access to silk products. The grave of the Marchioness of Dai, who died around 168 CE near Changsha, gives an idea of how sumptuous a burial could be. She was buried with 46 rolls of silk and numerous silk dresses, accessories, hangings, banners, and articles of clothing in a wide variety of silk weaves as well as more than 40 pieces of embroidery.

Silk made its way to central Asia in many different ways, through trade and as booty or gifts. As early as the first millennium BCE the Chinese used silk cloth and silk thread to buy off the nomadic tribes and confederations that constantly threatened their borders. Referred to as annual gifts, this tribute was redistributed by leaders to help cement loyalty contracts. In some regions such as the Caucasus, people were actually paid with strips of silk that were sewn to the regular clothing as decoration and provided a readily available source of currency in emergencies.

In Loulan and the region of Lop Nor, numerous graves from the third and fourth centuries CE contained silk fabrics. Most of these were produced in Sichuan province, a major textile center. The goods consisted of clothing and accessories of monochrome and polychrome Chinese textiles and Chinese embroideries. At Astana, 24 miles (40 kilometers) southeast of Turfan, 400 Chinese-style tombs were located.

THE GRAVES AT NOIN ULA

The burial grounds at Noin Ula, 62 miles (100 kilometers) north of Ulaanbataar, Mongolia, hold remains from the Xiongnu, a nomadic group that was active along China's northern border (ca. fourth century BCE–ca. first century CE). The largest tomb is thought to be that of Huhanye, a Xiongnu king who died in 13 CE. His tomb contained numerous objects of woven silk textiles and embroideries believed to have come from the Han imperial workshops in Xianyi, Henan Province. Some of these may have been received as gifts during his visit with the Chinese emperor. The variety of textiles covers almost the entire catalog of Chinese production at that time, including polychrome patterns, patterned gauzes, monochrome textiles with woven patterns, and even textiles with patterns woven in pile like modern velvet.

—Rebecca Wendelken

Dating from the late third century CE, these textile finds included fabrics, clothing, funeral banners, and even a bouquet of silk flowers. In some burials the deceased was covered with a blanket of tabby silk embroidered with mythological creatures, birds, and cloud patterns or with polychrome Chinese silk.

The importance of clothing for burials, especially silk, shows that the mourners were interested in providing the deceased with the best, a sort of conspicuous consumption that continued beyond the grave. However, not all had access to luxury goods such as silk and had to make do with other goods. Some grave finds show small pieces of silk as trim on woolen garments or scraps of silk pieced together to make small bags or sachets. However, woolen clothing could also denote rank. Many woolen finds from Xinjiang show complex weaves including gauze and polychrome patterning, some of which mimic those of silk fabrics. Finds from Shanpula in Xinjiang contain complex locally made woolen tapestry bands but also imported tapestries from the West. These finds dating between the third century BCE and the fourth century CE show that expensive textiles could be recycled, as was a pair of pants made from a woolen tapestry.

Fabrics were not the only materials used in grave goods for clothing. In Astana, grave clothing and shoes were made from recycled papers, showing a need to clothe the occupant in the afterlife even if unable to afford to do so in a grand way in the present.

Paracas Burials and Their Textiles

In the Paracas Peninsula, on the southern coast of modern-day Peru, over 500 mummy bundles were preserved in shaft tombs and subterranean structures. Associated with the Paracas culture, the bundles were filled between 300 and 175 BCE. They possibly constitute the largest ancient textile find yet discovered. The high degree of preservation of these otherwise fragile artifacts is due to the dry climate of the southern coastal regions of Peru. Burials were discovered in the 1920s, and many were almost completely intact, another exceptional factor of Paracas textiles' preservation.

Shaft tombs are usually referred to as *cavernas* ("caverns"), but they are in fact human-made chambers built underground. They hosted up to 40 mummies and could be reached through a shaft about 30 feet (9 meters) deep. These tombs are found on Cerro Colorado (Colored Hill), a mound covered in purple gravel that can be seen from a distance rising from the desert plain. Not far is the so-called Necropolis (City of the Dead), which yielded the largest number of mummies, preserved inside multiple and often interconnected quadrangular masonry chambers that were constructed a few feet below the earth's surface. Each room could host several different bundles, placed on top of one another, while sometimes a (presumably) more

important one is found in the center. Necropolis burials show a greater degree of variety in terms of offerings and textiles than the previous shaft tombs.

Only a few (and particularly large) bundles have been thoroughly researched and fully unwrapped, providing information on the complex procedure by which a bundle was created. The deceased was first placed in a seated fetal position inside a basket. The naked body was adorned with a headband, bracelets, and necklaces. On the legs, a gourd was placed containing food offerings of corn, potatoes, and beans. Other common objects include gold sheets, obsidian blades, a pouch containing powder possibly used for body paint, a sling, a feather fan, and a few unspun camelid fibers. These latter items indicate a particularly wealthy status or an occupation such as warrior, long-distance merchant, or powerful priest. All the unwrapped bundles are males, but so far only the largest ones have been unwrapped. The smaller ones probably contain females and children. The body was eventually wrapped in a plain loin-cloth and placed on the basket with the objects. Several layers of rather plain, fragmentary, or unfinished cloths (up to 15) were wound around the body. A second layer of textiles was then wrapped around the bundle, including the basket and the mummy and objects therein. These were rough cloths, which could be as long as 33 feet (10 meters). Secured with stitches, their only purpose was to increase the size of the bundle. The bulk of the head was accentuated by more material tightened with a string. At this stage, a wooden staff was placed vertically, as a sign of authority, together with a varying number of lavishly embroidered textiles. These could take the shape of tunics (knee-long rectangular garments with a neck slit, sewn on the sides), ponchos (a short and open rectangular garment with a neck slit), turbans for head decorations, and extraordinarily long mantels, averaging 42 by 85 feet (12 to 26 meters), decorated on most of their surface with fine embroidery (needlework). A single mummy could be wrapped in as many as 140 mantels. Finally, the bundle was covered with a large plain cloth, and the bottom was protected by a woven mat.

—Alessia Frassani

➤ PARACAS TEXTILE DESIGNS

The complex iconography displayed on Paracas textiles bespeak a complex spiritual world populated by animals, plants, and human performers. Highly repetitive patterns of embroidery depict birds (herons, condors, and falcons), felines, snakes, and sharks. Fish-eating birds were probably venerated because of their ability to dominate the sea, the sky, and the earth. Human figures in rich costumes also reflect the importance of the natural realm. Most impersonators in fact show a combination of bird, feline, and fish features (e.g., wings, a beak, a cat tail, or fins) while at the same time holding musical or ritual instruments employed by shamans during religious ceremonies (rattles, batons, hallucinogenic plants, trophy heads).

Role of Human Sacrifice in Olmec Society

Human sacrifice was a widespread phenomenon in the ancient Americas. It was the ultimate and most powerful of all acts of sacrifice, which ranged from simple offerings to dangerous bloodletting, during which the practitioner reached altered states of consciousness. Sacrifice

was the primary means of communication between the human and the supernatural in pre-Columbian American religiosity.

Among the Olmecs, human sacrifice is perhaps depicted on Monument 1 from Las Limas (now in the Museo de Antropología de Xalapa, Veracruz) and Monument 5 at La Venta (La Venta Archaeological Park, Villahermosa, Tabasco), where seated men hold a lifeless baby on their lap. The complete lack of written sources dating to this period prevents any definitive interpretation. The cleft head, flaring lips, and almond-shaped eyes clearly identify the baby as the so-called Olmec Supernatural, or Dragon, one of the most important images in Olmec Art. The ritual killing of a supernatural or deity is consistent with later information on human sacrifice practices in Mesoamerica. In the sculpture from Las Limas, the person holding the infant has incisions on the body. The iconography relates to different realms of the Olmec cosmos: the sky on the shoulder, represented by the profiles of bird creatures, and a shark and serpent on the knees, representing the watery underworld.

At the site of Chalcatzingo, Guerrero, low-carved reliefs show captives being killed by deity impersonators or dominated and devoured by feline creatures. The images probably mark the site of the sacrifice. Performers were likely local rulers, as images of enthroned personages at the site indicate. The ability to successfully perform human sacrifice gave rulers political legitimacy and sanctified their authority in front of the community. While ideological underpinnings point to an incipient sociopolitical complexity in Formative period Mesoamerica (roughly 1800 BCE to 200 CE), the ultimate goal of human sacrifice lay in the necessity of maintaining the balance of the cosmos through the constant renewal of life and death.

Role of Human Sacrifice in the New World Burials

Human sacrificial burials are found across time and space in the New World. During the Classical era (1000 BCE–300 CE), sacrificial burials are associated with monumental architecture, wartime activities, and peacetime sacrifices during times of societal and economic hardships. Animals, stone tools, ceramics, and rare materials (jade, metals, and incense) often accompany these human sacrifices.

Sacrifices can be differentiated by context. Wartime sacrifices usually consist of groups of able-bodied males captured in battle, as at Sechin Alto in South America or at Monte Alban in Mesoamerica. War captives were buried en masse and show evidence of extreme violence. Skull racks (*Tzompantli*) and sacrificial altars (*chacmool*) are common in Mesoamerica, while trophy head cults were more common in South America. Torture, broken jaws, bloodletting, decapitation, and mutilations are evident. Human sacrificial burials in peacetime demonstrate a great deal of respect with formal burials, ritual objects, drugs to lessen pain, and mortuary music.

Sacrificed mummies in the South American Andes are often fed and worshipped for thousands of years, as at Nazca culture sites in southern Peru. Andean mummy sacrifices are often so well preserved that details of sacrificial rites such as last meals and drugs administered can be determined. Strangulation was used in the south, while blows to the head with an unusual mace-spear weapon were common in the northern Moche civilization. The Moche used institutionalized sacrifices to appease the gods at their mud-brick pyramid cities along the northern coast of Peru, perhaps in response to El Niño events. The Moche rituals were part of an elabo-

rate belief system in which power, control, and human sacrifice were intertwined.

In Mesoamerica, Maya families might sacrifice their children in times of drought or hardship at wells and caves. Maya city-states practiced institutionalized sacrifice similar to the Moche in South America. Because the Maya left a written record, researchers can delve deep into the beliefs behind sacrifice. Mayan texts tell of twin corn brothers who must use self-human sacrifice to appease the underworld gods of Xibalba. Maya nobles practiced blood offerings and sacrifice of captured rivals. At Teotihuacan (1–650 CE), the largest city of the pre-Columbian Americas, a preplanned pyramid sits over sacred caves that contained nearly 60 sacrificed individuals from several ethnic groups. Obsidian and jade stone knives were used in sacrificial rituals in Mesoamerica. Monumental architecture and religious beliefs throughout the Americas were often associated with human sacrificial rites.

In North America, nomadic plains cultures sacrificed and cremated a chosen juvenile in seasonal rituals to keep celestial bodies moving. Bows and arrows were common sacrificial tools. Sacrificial burials are also known from mound-building cultures in the East and farming villages in the Southwest, but it is difficult to determine if violent deaths were always sacrificial due to limited contexts for those finds. Despite stringent archaeological criteria for separating violent deaths into subcategories such as sacrifice, murder, accident, warfare, and the like, the smaller-scale societies of North America often lack enough context to come to certain conclusions.

➤ MAYA HUMAN SACRIFICE

The Maya civilization of Mesoamerica left behind an unparalleled record for New World civilizations with glyphic writing, classical urban centers, and modern Maya descendants. Sacrifice and bloodletting were integral to the Maya worldview for a balanced cosmos. Maya peasants and elites practiced human sacrifice in times of peace and war. Family might be sacrificed in stressful times, and elites practiced bloodletting and sacrifice of captives in ritual ball games. Maya art, writing, and archaeology all indicate the presence of human sacrifice, though not on the scale associated with later central Mexican warlike societies.

Shaft Tombs from Western Mexico

The burial sites of the ancient peoples of western Mexico consisted mostly of shallow pits with few grave goods. However, the remains of those in the higher social classes were housed in shaft tombs. The amount of labor required to build these tombs and their rich contents indicate that they were reserved for elite families.

Shaft tombs appeared in western Mexico during the Mesoamerican Formative period (1500 BCE–200 CE) but particularly during the “Teuchitlan tradition” of the Late Formative (Pre-Classic) period in western Mexico (300 BCE–150 CE). The peoples in the Teuchitlan tradition lived in pre-Columbian societies noted for circular central plazas, four-tiered hierarchical settlements, and conical pyramids.

Prior to the 1993 discovery of the first unlooted tomb at Huitzilapa in Jalisco, information about the shaft tomb tradition came solely from looters. Shaft tombs are primarily found in three modern-day western Mexican states: Jalisco, Nayarit, and Colima. The tombs of Jalisco are the most elaborate, and the region is considered to be the core of the shaft tomb tradition.

The shaft tomb occupants shared lineage. Analysis of DNA from the remains from the Huitzilapa site shows that most of the individuals

➤ FIGURINES FROM SHAFT TOMBS

Grave goods from the shaft tombs of western Mexico demonstrate a wide variety of materials, techniques, and subject matter. In Jalisco, tombs contained figurines modeled from clay, depicting humans with elongated faces, high foreheads, and prominent noses engaged in everyday activities.

Craftspeople in the Nayarit region painted details onto their sculptures and represented humans with widely separate eyes and ample body adornments, including ear and nose piercings. These figures are often called “Chinesco” for their supposed Chinese-like appearance.

The ancient peoples of Colima are well known for their hollow figures of animals, humans, and plants in round, smooth forms made from warm-brown slip (watery clay molded by hand). The most common animal in Colima art is the hairless dog. The widespread appearance of ceramic dog figurines shows their multipurpose roles as watchdogs to the dead, healers, and sources of food.

—Kim Kennedy White

buried in the tomb were genetically related. The shaft tombs therefore housed extended families of the elite.

The tomb builders dug down into the ground to create oval-shaped vertical shafts leading into side chambers, where the dead and burial goods were placed. These shafts varied from 10 to 65 feet (3 to 20 meters) deep and were often built under structures within the community’s complex.

The contents of the shaft tombs demonstrate social status. Grave goods consisted of prestige goods (luxury items) as well as ceramic figures and pottery containing food and precious materials such as beads, crystals, pyrite, jade, turquoise, and conch shells. Materials used to create these grave goods were both local and imported from outside the region. Unlike other Mesoamerican cultures, the contents of the shaft tombs provide little evidence for religious or symbolic meaning.

Anthropomorphic figurines depict valued people in the community: warriors, political figures, and shamans. Dioramas discovered in the tombs and looter sites replicate housing, shaft tombs, and people engaged in everyday activities.

Researchers continue to study recently discovered intact tombs in order to understand the relationship of the ancient peoples of western Mexico with the whole of Mesoamerica and the role of shaft tombs within these societies.

Migration and Travel

“By the Rivers of Babylon—there we sat down and there we wept
when we remembered Zion.”

—Psalm 137:1

This lament was written by Judean exiles living in the Mesopotamian city of Babylon after the destruction of Jerusalem in 586/587 BCE. When the Babylonian king, Nebuchadnezzar, destroyed the Temple in Jerusalem and brought an end to the kingdom of Judah, he deported many Judeans to Mesopotamia. These Judeans, most of whom had never left Judah before, lived together in Babylon and maintained their ethnic identity in this foreign setting. The difficulties of preserving their Judean heritage were immense, and in fact exilic culture underwent a number of transformations, including the adoption of Aramaic (in place of Hebrew) as their language of daily use. These difficulties, however, likely played an instrumental role in motivating this community to preserve its writings, stories, and legal traditions, a process that led to the compilation of the books of the Tanakh (Old Testament).

These exiles did not remain in Babylon long, eventually returning to Judah after the conquest of Babylon by the Persians. With the growth of the Persian empire, travel around the Near East became easier, safer, and more common. Concomitantly, in the Greek world, travel throughout the Mediterranean came to be more common as the economic relationships between the Greek city-states became more intertwined.

By the time the Judahites had been sent into exile in Babylon, the Phoenicians, whose homeland was situated north of Judah (in modern Lebanon) began expanding out of the Levant. The Phoenicians traveled throughout the Mediterranean trading purple dye and the cedars of Lebanon for tin and other precious commodities found elsewhere. They established trade colonies in North Africa, most notably at Carthage, as well as on the Spanish coast. These Phoenician colonies eventually came into conflict with the Romans and were destroyed or incorporated into the Roman empire.

After the Phoenicians had established their colonies, the conflict between the Greeks and the Persians was settled when Alexander the Great, king of the Macedonians (and leader of the Greek world), routed the Persians in 331 BCE. Alexander continued the westward expansion of the Greeks, and by his death in 323 his Hellenistic empire controlled Egypt, the Levant, Mesopotamia, Persia, and parts of Afghanistan and India. Although Hellenistic military authority over these regions did not extend much past his death, Hellenistic culture became firmly entrenched

in western Asia. Hellenistic city types, institutions, and beliefs remained, as did many of the veterans of Alexander's army, merging Greek culture with the indigenous traditions of the East.

When power shifted from Greece to Rome, the opportunities for travel increased even further. The Roman talent for road construction was immense, and as Rome expanded so did the infrastructure for transportation. At its largest extent, the Roman road system spanned 52,195 miles (84,000 kilometers). Many of these Roman routes are still

in use today, although the Roman materials have mostly been replaced. Maritime travel also connected people throughout the Roman world, which was made safer by the Roman ability to suppress piracy.

As travel became easier in the more heavily settled regions of the world, transportation became possible in more marginal regions. The domestication of the

camel allowed travelers to pass through large expanses of desert, opening up a number of trade routes. The Nabataeans took full advantage of these advances and created a trade route between Arabia and the Levant, traveling through southern Jordan. Similarly, Bedouin culture was able to expand. While there had been people living in the deserts of Egypt and the Levant for centuries, the camel allowed these desert dwellers to travel farther, utilizing arid land that had been previously out of reach.

The longest of these new trade routes were the Silk Roads, which tradition holds were first opened in 114 BCE by the Han dynasty in China but which were in operation long before then. Connecting Asia, Europe, and Africa, these were the first truly global roads, although it should be noted that what generally traveled along them were high-profit luxury goods that were transferred along the way from hand to hand. The Silk Roads are better thought of as a series of interconnected, parallel, and often shifting caravan routes that connected China with the Mediterranean; in fact, many of the routes that made up the Silk Roads were in use for centuries before. Connecting and policing these routes was an innovation made possible by a number of factors: the political and military authority of the Han state, the commercial interests of the nomadic tribes who benefited more from taxing and protecting these caravans than raiding them, and the wide variety of beasts of burden suitable for every climate and terrain, most notably the Bactrian camel. This long-distance route system allowed people of all sorts to experience the world, and new types of travelers emerged.

Religion became a motivating force for travel in a way that it had never been before. Pilgrims now had the opportunity to visit sites of religious significance to their traditions, and gradually this came to be an important component of the spiritual life of many believers. Holy locations and temples thought to be particularly efficacious for the fulfilling of certain needs (such as dream interpretation or physical healing) were popular destinations. Missionaries, such as Buddhist missionaries from India who went into Ceylon, Burma, central Asia, and elsewhere,

At its largest extent, the Roman road system spanned 52,195 miles (84,000 kilometers). Many of these Roman routes are still in use today, although the Roman materials have mostly been replaced.

also began traveling, spreading the messages of their particular traditions throughout the world. Buddhism became the first world religion (especially the Mahayana form). Some religions stopped being just something that was part of one's local cultural traditions, becoming messages that needed to be spread to the other people of the world. Thus, throughout this period, the religious traditions of India began to spread through East and South Asia, and Christianity began its movement through the Near East and Europe.

It was not just merchants and missionaries who traveled between 1000 BCE and 300 CE. Large-scale population migrations altered the landscape of human settlement patterns. The migration of Bantu-speaking people in Africa continued and intensified after 1000 BCE. Nomadic groups in central Asia moved into new lands and displaced other inhabitants of the region. Celtic populations similarly spread through continental Europe. Polynesian populations continued to expand through the South Pacific, settling on previously uninhabited tropical islands. Maya people expanded the scope of their culture into the lowlands of Mesoamerica.

—Kevin M. McGeough

■ Introduction: Migration

What causes people to migrate from their homes to unfamiliar regions? This is a fundamental question that historians are forced to ask when trying to understand the complex movements of ancient people. For most of these ancient immigrants it must have been a combination of factors that led them to take the risk of abandoning the security of a known lifestyle to try something new. The Phoenicians, for example, were spurred on to expand their territorial holdings from the Lebanese coast into North Africa in order to gain material advantage in trade and because of the different resources available in Africa. Greek and Roman expansion was influenced both by the urge for new trade and resource acquisition and as a means of creating opportunities for growing populations that could not be sustained by their local environment.

Many of these immigrants may not have had much choice other than to move. The military aspirations of larger or more powerful states were likely major influences on the movement of people from 1000 BCE to 300 CE. Forced de-

portation was a tactic that the Mesopotamian empires of Assyria and Babylon used to great effect in the Iron Age (1200 BCE–332 BCE). By moving wealthy and powerful members of a group away from their homeland, these Mesopotamian kings were better able to control large territories far from their capitals. The effects of such forced migrations on the indigenous populations are well illustrated by the accounts in the Hebrew Bible.

Other forced migrations were not based so much on military threat as they were on environmental change or resource stress. Refugees from the eruption of Cuicuilco in what is now known as Mexico exemplify the type of migration that is compelled when a local environment is changed dramatically.

The following entries detail some of the major migrations (and forced migrations) that took place in the period from 1000 BCE to 300 CE. Some of these migrations, such as those of the Greeks and Romans, are well known from written sources. Other movements, such as the gradual settlement of the islands of the Caribbean

are known primarily from the archaeological record, through tracking the spread of distinct types of material culture from one island to the next.

Bantu Expansions, circa 1000 BCE–500 CE

The history of the Bantu expansions is a story that is told with an unfamiliar historical source—linguistic data—about historical actors who were first and foremost speakers of related languages rather than residents of the same territory or citizens of the same polity. It is nonetheless a history of significant achievement from both the perspective of change over time and continuity through time. From a shared linguistic and cultural heritage with origins some 5,000 to 7,000 years ago, speakers of Bantu languages innovated a diverse range of economic practices, types of political organization, and means of forming relationships with others even while they retained words and ideas that had brought their ancestors success many generations earlier.

By 1000 BCE speakers of Bantu languages had carried their ways of speaking and living to the edges of the equatorial rain forest and were poised to spread into the Great Lakes region of eastern Africa and the southern savannas of central Africa. A number of innovations from 1000 BCE to 500 CE transformed the ways in which Bantu-speaking people made a living and built communities. The processes of independent, multiple innovations and widespread diffusion worked in tandem as Bantu speakers learned to grow new crops, smelt ores into fine-grade irons, and intensify their use of cattle. Changes in the economy proceeded in lockstep with equally influential changes in social life; as Bantu speakers invented new ways to make relationships, they could organize their efforts to better use new technologies, and conversely, new technologies could and did drastically reshape social and political relationships.

Bananas, including starchy plantains, entered Africa from the Indian Ocean coast and spread westward into the equatorial rain forests by the last centuries BCE and perhaps as early as

the early first millennium BCE. This Asian crop required little labor input once trees were planted and had a far greater output than yams. Banana gardens allowed people to live in more sedentary communities and focus their efforts on learning other technologies such as iron smelting. Moreover, steady selection of bananas for particular characteristics such as flavor and pest resistance led to an impressive variety of cultivars, a testament to the technological virtuosity of African peoples.

Scholars now believe that iron smelting was invented several times in different locations in Africa. Ores were smelted into iron by at least the sixth century BCE in present-day Nigeria and perhaps as early as the first centuries of the first millennium BCE in the Great Lakes region. New evidence suggests that one of these centers of innovation was the source of the smelting technology that spread into the equatorial rain forests certainly by the closing centuries of the last millennium BCE, although smelting might have been practiced in the rain forests of present-day Gabon several centuries earlier. Iron working transformed where people could settle because iron tools were more efficient for cutting gardens out of the forests and breaking up dense soils.

From the eastern margins of the rain forests, several Bantu-speaking communities created the conditions that supported a rapid spread eastward into the Great Lakes region, as far east as the Indian Ocean, and as far south as present-day South Africa. Early and prolonged contact with speakers of non-Bantu languages made an important contribution to the knowledge of Bantu speakers as they learned new crops, herding strategies, and ironworking technologies. The successful manipulation of these new technologies helped propel the rapid spread of some Bantu languages down the East African coast during the last millennium BCE and the first millennium CE.

In the Great Lakes region (present-day Rwanda, Burundi, Uganda, western Kenya, and northwestern Tanzania), speakers of different Bantu languages transformed the forest-oriented root-cropping system they had learned from their ancestors into a food system suitable for the drier lands east of the rain forest. Great Lakes Bantu speakers learned about cereal crops and

BANTU MIGRATION

livestock raising from Sudanic, Cushitic, and Sahelian peoples and combined these forms of farming with their own knowledge of root cropping, hunting, and fishing to create a dynamic mixed-food system. Iron smelting was widely established by the closing centuries of the first millennium BCE; lexical evidence suggests that Bantu speakers also learned this skill from their non-Bantu neighbors. Together, these technological innovations helped Bantu speakers to settle the diverse environments surrounding Lake Victoria by the sixth century CE.

During the first millennium CE Bantu-speaking inhabitants of the Great Lakes region increasingly turned their attention to growing bananas along the coastlines of Lake Victoria and to intensive cattle keeping in the savannas between the highlands of the Western Rift and the lakeshore. By the turn of the first millennium CE specialization in banana farming and cattle herding had redefined the content of wealth and the ways in which people sought to access and control productive herds and banana plantations. Concerns about the risks associated

➤ RACIAL POLITICS AND THE BANTU CONCEPT IN SOUTH AFRICA

For many people, the word “Bantu” evokes the racial politics of twentieth-century South Africa rather than the genetic classification of African languages. Racism was not unique to South Africa; indeed, it characterized relations long before the colonization of the continent by Europeans. Yet racism in South African politics took a unique path. As ideas about white supremacy began to wane in most parts of the world after World War II, they strengthened in South Africa under the legalized discrimination and segregation of the apartheid (separateness) system. A series of laws enacted in the late 1940s and early 1950s created racial classes of people and segregated all forms of association between them, from marriage to residence, from transportation to education. In these policies, the term “Bantu” was applied to black Africans, transforming a linguistic category into a racial identity. The Bantu education policy of the apartheid government sought to acculturate black Africans to a traditional rural lifestyle at the same time that housing policy removed black urban wage workers to rural, segregated Bantu-

stans. Bantustan policy was a divide-and-conquer strategy that segregated black Africans along ethnic lines, undermining black resistance to white minority rule. Yet throughout the twentieth century, Africans debating the future of independent African states and the content of shared African culture also used the root word of the term Bantu, *ntu*. In South Africa, the concept of *ubuntu* (humanity) was a founding principle of the African National Congress (ANC) government that came to power in 1994, ending apartheid.

with pastoralism and banana farming were mediated through new ideas about social organization, religious authority, and routes to political power. For example, those with banana gardens sought to protect their perennial banana trees by inventing the custom of reckoning family and inheritance through the father’s side (patrilineality). Owners of large herds developed special relationships of dependence and friendship to enlarge the people to whom they could loan cattle from their herds, thereby hedging against the risks of localized disease and drought. In some areas the invention of the concept of chiefly leadership supported the centralization of political power. In other areas specialists in appeasing territorial and ancestral spirits or in healing afflictions such as infertility provided alternative avenues to wealth and power and ways of contesting centralized chiefly and, eventually in the second millennium, kingly power.

During the first millennium many Bantu-speaking peoples in east-central and southern

Africa were, like their counterparts in the Great Lakes region, shifting toward intensified cattle keeping. These two shifts were independent changes, taking place thousands of miles apart; the simultaneous shift toward cattle keeping in both places is not surprising, however, for cattle herds are a mobile, transferable, self-reproducing form of wealth. Cattle were both a food supply and an object with which to cement ties between families when youths married, between friends, and between patrons and clients. Generally, then, early experimentation in banana farming in the Great Lakes region and cattle raising in eastern and southern Africa and later efforts to specialize in these skills during the first millennium CE were important processes underpinning later innovations in political centralization in Bantu-speaking societies during the second millennium CE.

In other parts of central and southern Africa Bantu-speaking communities followed a different trajectory. In south-central Africa iron tools,

cereal crops, and even the adoption of cattle keeping and wealth from copper working helped people settle new drier environments and increase the size of their villages. However, these changes did not necessarily lead to political centralization as they did in the Great Lakes region and southern Africa during the second millennium. While social stratification, organization into lineages and clans, and membership of distinct political territories were an increasingly important part of life during the first and even second millennia CE, some peoples in the savannas of central Africa invented unique paths to status. In south-central Africa the cultivation of personal reputation in certain crafts such as cooking, hunting, and sowing seeds gave some individuals particular economic and social advantages, advantages that shifted by season or by level of success. In the Kalahari Sands region of west-central Africa collective ideas about society as an interplay of statuses, roles, and individual distinction led to a variety of local elaborations on a shared institutional foundation of villages, vicinages (collectivities of villages), and associations based on age and gender.

The Arrival of New People in Japan and the Founding of the Yayoi

Compared to the Jomon period, the succeeding Yayoi period is short. This does not downplay its importance, though. Three important cultural items—rice agriculture with paddy fields and bronze and iron metallurgy—were introduced from the Asian mainland into the Japanese Archipelago. Various other new techniques were also introduced, including advanced pottery technology, polished stone tool technology, irrigation systems, and weaving. The Yayoi period is also characterized by some clear evidence of social stratification and the emergence of a social elite.

Traditionally, the Yayoi period has been divided on the basis of pottery chronology into four phases: Initial (ca. 500–300 BCE), Early (ca. 300–100 BCE), Middle (ca. 100 BCE–100 CE), and Late (ca. 100–300 CE). In recent years, though, a debate has erupted on dates for the Yayoi period. At several sites, Middle Yayoi pottery was associated with bronze mirrors of the Former Han period (206 BCE–9 CE) in China, which seemed to confirm the reliability of this conventional chronology. However, in the 1990s dendrochronological studies of wood excavated from Yayoi and Kofun period sites are raising questions about the reliability of the absolute dates for the Yayoi subphases. More recently, results of radiocarbon dates from Initial Yayoi sites indicate that the beginning of the Yayoi period in Kyushu goes back to as far as 900–1000 BC.

It must be kept in mind, though, that the Final Jomon did not end at about 900 BCE throughout the entire Japanese Archipelago. Scholars agree that the Yayoi culture was first established in northwestern Kyushu and then spread quickly toward the northeast and next into the Kinki region. By the middle of the Early Yayoi period, sites associated with Yayoi pottery can be found up to the Tokai region. Dispersal of the Yayoi culture to the Kanto, Chubu, and Tohoku regions was slow, and thus the majority of Yayoi sites in these regions are dated to either the Middle or Late Yayoi periods.

What is the definition of the Yayoi period? Until the 1950s, the definition was the period

during which Yayoi-style pottery was used. This definition was acceptable when the earliest evidence for rice agriculture was associated with the earliest Yayoi pottery. In the 1960s some archaeologists began to suggest that in northwestern Kyushu, rice agriculture was adopted prior to the adoption of the new style of pottery. In 1975 Makoto Sahara, an authority of Yayoi archaeology, redefined the Yayoi period as the period in which food production (in this case, rice agriculture) first formed the economic basis of Japanese society. In the 1980s excavations of the Itatsuke site and the Nabatake site in Kyushu revealed that the adoption of wet rice cultivation preceded the adoption of the new style of pottery: both sites were originally classified as Final Jomon sites on the basis of stylistic characteristics of pottery, but clear evidence of rice paddy fields was found.

Typical Yayoi-style pottery is quite different from Jomon pottery. It is much thinner than Jomon pottery and is generally better fired. One of the main differences between Jomon and Yayoi pottery is in the shape of vessels. The most common shape of Jomon pottery is the deep bowl for cooking, with a small number of pottery with other forms, including shallow bowls and incense burners. The assemblage of Yayoi pottery is usually characterized by several different types of vessels, including the storage jar, the cooking pot (similar to the Jomon deep bowl), the serving dish, and the pedestaled dish. This variety of vessel shapes is related to rice agriculture; the new pottery forms account for the storage of rice and changes in cooking methods.

It is agreed that wet rice agriculture was introduced into Japan from mainland Asia. Furthermore, early evidence of rice cultivation in Japan is concentrated in northwestern Kyushu. Scholars also agree that rice cultivation techniques of both the Yayoi culture and the Mumun culture in Korea share a number of characteristics with the rice cultivation practice in the Yangzi Delta region of China. What scholars do not necessarily agree about is the adoption route of rice agriculture.

Three possible routes have been suggested: the Southern Route, the Direct Route, and the Indirect Route. The Southern Route hypothesized that the route stemmed from the Fujian

area in southern China or Taiwan and traveled straight up to the Ryukyu Islands. This was originally suggested in the 1960s by Kunio Yanagita, who was an influential folklorist. This hypothesis is not supported by archaeological data, however, as there is no evidence of rice cultivation from this period in the Ryukyu islands and southern Kyushu.

The second possibility is the Direct Route, which assumes that rice diffused directly from the lower reaches of the Yangzi River to northern Kyushu across the China Sea. This hypothesis is not considered likely either, since the lower reaches of the Yangzi River has both the round and slender grain varieties. In Japan, only evidence for the round grain varieties has been recovered.

The Indirect Route also starts from the lower reaches of the Yangzi River, but it is a roundabout route via the Shandong Peninsula and then through northern Korea. Most scholars support the Indirect Route hypothesis, although there are several possible subroutes, and the possibility of less frequent contact via the Direct Route is also suggested.

In terms of the physical anthropology, excavations of Yayoi sites in southwestern Japan have revealed the existence of two distinct types of human remains: indigenous Jomon type and an immigrant population from the continent. Both of these skeletal remains are associated with Yayoi-style artifacts. The Jomon type people were shorter, more robust, and round-faced, whereas the immigrant type people tended to be taller, less robust, and long-faced.

According to Kanaseki, although skeletal remains from Early Yayoi sites in Kyushu include both types of remains, the immigrant type is distributed mainly in northern Kyushu and the western edge of the Honshu Island. In southern Kyushu, Early Yayoi skeletal remains are the indigenous Jomon type. This would imply that in Southern Kyushu, the indigenous inhabitants accepted the Yayoi culture. Based on these lines of evidence, Kanaseki concluded that the presence of Yayoi culture does not always indicate the presence of immigrants.

According to Kanaseki, these immigrants came from the southern part of the Korean Peninsula. For the moment, there is not much com-

parative data available from the Korean Peninsula. Nevertheless, we can say that the original immigrants who brought the Yayoi culture lived originally in northern Kyushu and the western edge of the Honshu Island and then gradually mixed with the indigenous people.

The next question is, How many immigrants came to Japan? Hanihara's population simulation work published in 1987 is one of the few attempts to estimate the amount of immigrants during the Yayoi and Kofun periods. He uses two simulation models based on population growth and on morphological changes. Both models suggest that the number of immigrants must have been much greater than previous estimates.

Hanihara's work is based on several assumptions. First, he assumed that, based on Koyama's work, the population in Japan declined drastically during the Final Jomon period. According to Koyama's estimate, there were only 75,800 people at the end of the Jomon period, but by the end of the Kofun period (ca. seventh century CE), the estimated population was as high as 5.4 million. Hanihara points out that if there had been no immigrants to Japan, then such a dramatic population increase would have involved an annual population growth rate of 0.427 percent per year, which is an extremely high rate for most small-scale agricultural societies. He further states that most agricultural societies had a growth rate of less than 0.1 percent.

If the rate of 0.1 percent had been the case (i.e., if there had been no immigrants), then the population of 700 CE would have been only 200,000. Therefore, in order to make up the 5.4 million estimated by Koyama, we need more than 3 million immigrants from the beginning of the Yayoi period to the seventh century CE. Even if we assume that the annual population growth rate was 0.2 percent and that the Final Jomon population was 160,300 (alternative population estimate in the end of the Jomon period), we still need 1.3 million immigrants. While these estimates are based on several assumptions that can be questioned, nevertheless his work indicates that the number of immigrants is likely to have been quite large.

In recent years, DNA research on the modern male population has also contributed to this debate. Research by Hammer and Horai on the Y

chromosome has found that approximately 61 percent of the male Japanese population carry a Y-chromosome polymorphism that is not found in other Asian male populations. They equate this with the Jomon inhabitants of Japan. The remaining 39 percent who do not carry the polymorphism are equated as being descendants of the Yayoi immigrants.

The Origins of the Gojoseon of Korea

Various tools from the Paleolithic Age uncovered in all parts of Korea indicate that human beings have inhabited the area for half a million years. It is not clear when their ancestors began to inhabit the peninsula, but most scholars agree that present-day Koreans are not the ethnic descendants of those Paleolithic people. Contemporary Koreans descended from Neolithic groups who entered the peninsula from areas north of Manchuria, probably in several successive migrations between 5500 and 2000 BCE.

The Koreans are Tungusic peoples, cousins of the Mongols, and their ethnic origin may be traced from those who lived in and around the Altaic Mountains in central Asia. Some of the strongest evidence for this origin is the fact that modern Korean is part of the language family of northeast Asia called Altaic.

The early tribal peoples had a fishing, hunting, and gathering culture. They produced

comb-pattern pottery similar to that found in northern Europe and Siberia and later, after the emergence of agriculture, built large above-ground tomb chambers of stone blocks, often mounded over with earth. Evidence of rectangular huts and burial sites in the form of dolmen and stone cysts is widespread. The early Koreans believed in animism and thought all natural objects had spirits. Artifacts were closely connected to their religious practices.

The standard account of the origins of Ancient Gojoseon (Old Joseon) is contained in the legend of the first great ruler, Tangun, who was born of a union between the son of the divine creator and a female bear that had achieved human form. Tangun made the walled city of Pyongyang the capital in 2333 BCE, called his country Gojoseon (Land of the Morning Calm), and ruled for fifteen hundred years. No evidence has been found that supports whatever facts may lie beneath this myth, but over the centuries the legend has contributed to the Korean sense of identity as a distinct and proud race.

The walled-town state of Gojoseon in time combined with others to form a single large confederation, the head of which came to be designated as its king. The use of iron hoes, plowshares, and sickles brought significant social changes. Food production increased, particularly benefiting the ruling elite. Artifacts from this period also include bronze and iron daggers and spears. Families still lived in pit dwellings, but the use of *ondol* devices (heating of flues under the floor) appeared.

Celtic Migrations and the Rise of Hallstatt and La Tène Cultures

Hallstatt and La Tène are the two archaeological cultures most commonly associated with the

late prehistoric Celts. The Hallstatt culture, named after a small town in upper Austria, started in the Late Bronze (ca. twelfth through ninth centuries BCE) and continued into the early Iron Age (ca. eighth through fifth centuries BCE). Its main area of distribution encompasses eastern France, southern Germany, Bohemia, Austria, western Hungary, Slovenia, parts of northern Italy, and Switzerland. The La Tène culture, named after a find spot at Lake Neuchatel in Switzerland, is the archaeological material culture of much of central and western Europe in the later Iron Age (ca. fifth century BCE through first century CE).

The so-called west Hallstatt chiefdoms of the early Iron Age were located in eastern France, southern Germany, Bohemia, and northern Switzerland. These areas were frequently considered to have been the birthplace of Celtic culture. It is this area that is associated with Celts in the earliest historical attestations: the Greek author Hekataios (sixth century BCE) speaks of Celts in the hinterlands of Massalia in southern France, while Herodotos (fifth century BCE) mentions the Celts as settling between the upper Danube and the Atlantic coast. The first evidence for Celtic languages also comes from this period: short texts in a Celtic language, Lepontic, dating from as early as the sixth century BCE, are found in the area of the so-called Golasecca culture in northwestern Italy, which has very close links with the southern German and Swiss Hallstatt chiefdoms.

The La Tène culture seems to have originated on the northern periphery of the west Hallstatt chiefdoms in the first half of the fifth century BCE. From there, it quickly spread across much of central and western Europe, reaching its greatest extent in the third century BCE. At this point it covered an area between Ireland in the northwest to Galatia in modern Turkey in the southeast. This is also the period of the historically attested Celtic migrations, which peaked in the sacking of Rome in 387 BCE, and the migration of the Galatians to Asia Minor in 287 BCE.

However, while migrations definitely played a role in the expansion of the La Tène culture to the south and southeast, its spread to the west and northwest is no longer primarily explained

by migrations. Other processes, such as trade, adoption of elite identities and associated material cultures, marriage alliances, and fosterage of children of elites and artisans abroad, were probably at least as important as migrations. As a consequence of these processes, small-scale communities, which were essentially locally constituted and never achieved any kind of political unity, created very similar objects, culminating in a relative uniformity of some aspects of material culture, particularly those associated with social elites, across much of Europe in the last three centuries BCE. At the same time, most other aspects of culture clearly continued local traditions, indicating that no massive displacement of earlier populations by newly arrived ones was taking place.

As a consequence of this, the idea of a uniform Celtic people that expanded, by military conquest, to control much of Europe by about 300 BCE has collapsed. Scholars now agree that there never were Celts but rather many different locally constituted societies that shared some similarities but were fundamentally different from each other. While the term “Celtic” continues to be used and remains useful to describe

these similarities, particularly in the fields of language and art, it has lost much of its explanatory power where actual historical processes in late prehistory are concerned and has mostly been abandoned in archaeology.

Assyrian, Babylonian, and Persian Deportations

Deportation was a typical strategy utilized by the major powers of the ancient Near East after conquering a new territory. The goal was to spread the various groups of conquered peoples

➤ AN OUTSIDER VIEWS THE GAULS

Diodorus Siculus, a Greek author who lived in Sicily, wrote an extensive text called *Library of History* between 60 and 30 BCE. This text is particularly important as an account of the Celts because it incorporates the earlier text of another Greek author, Posidonius, whose original first-hand observations of the Celts have otherwise been lost.

“The Gauls are tall of body, with rippling muscles, and white of skin, and their hair is blond, and not only naturally so, but they also make it their practice by artificial means to increase the distinguishing colour which nature has given it. For they are always washing their hair in lime-water, and

they pull it back from the forehead to the top of the head and back to the nape of the neck, with the result that their appearance is like that of Satyrs and Pans, since their treatment of their hair makes it so heavy and coarse that it differs in no respect from the mane of horses. Some of them shave the beard, but others let it grow a little; and the nobles shave their cheeks, but they let the moustache grow until it covers the mouth.”

—Raimund Karl

Diodorus Siculus, *Library of History* (Cambridge: Loeb Classical Library, Harvard University, 1967), 5.28.1–3.

throughout the empire, thus weakening the pre-existing social and political bonds and making it less likely that these groups could organize and foment rebellion against their new rulers. The degree of assimilation of the dislocated peoples varied widely depending on the population in question. Some groups, such as the Ammonites and Moabites, largely disappeared from the historical record; others, such as the Jews, managed to maintain their distinct cultural identity and exist to this day.

➤ DEPORTATIONS IN THE BIBLE

“Then he [Nebuchadnezzar] led away into exile all Jerusalem and all the captains and all the mighty men of valor. . . . None remained except the poorest people of the land. . . . For through the anger of the LORD *this* came about in Jerusalem and Judah until He cast them out from His presence” (2 Kings 24:14 NASB).

“Thus says Cyrus king of Persia, ‘The LORD, the God of heaven, has given me all the kingdoms of the earth and He has appointed me to build Him a house in Jerusalem, which is in Judah. Whoever there is among you of all His people, may his God be with him! Let him go up to Jerusalem which is in Judah’ (Ezra 1:2–3 NASB).

—John Walton Burnight

Although the Neo-Assyrian, Neo-Babylonian, and Persian empires of the first millennium BCE all made use of deportations, the methods and accompanying imperial rhetoric utilized by each showed significant differences. The Assyrians generally removed one population and replaced it with another from a different part of the empire; the Babylonians, however, merely took vanquished groups to the heart of the empire, with little or no attempt to move other peoples in to take their place. Both empires, though, used tactics and rhetoric that seemed designed to terrify the subject peoples into submission; this terror is reflected, for example, in the prophetic literature describing the fall and subsequent deportations of Samaria and Jerusalem to Assyria and Babylonia, respectively. As a result, the threat of exile became a proverbial punishment in the Hebrew Bible.

After the Achaemenid ruler Cyrus the Great conquered Babylon in 539, the Persians initiated their own large-scale transportations of subject peoples. Unlike the Assyrians and Babylonians, however, the new empire generally preferred the rhetoric of persuasion to that of terror and coercion. Indeed, Cyrus’s famous decree that the Jews be allowed to return to Judah en masse (cf. Ezra 1) was in all likelihood the catalyst for the biblical authors proclaiming him “messiah” (i.e., “anointed” to rule; cf. Isaiah 45:1), a title that previously had been reserved only for Israel-

ite/Judahite kings and reflected a new universalism in biblical religion. Cyrus's successors would not always enjoy such a positive reputation with their subject peoples, however; Darius (522–486 BCE), for example, forcibly deported Greek-speaking peoples after the Ionian revolt, transferring large groups to the eastern part of his empire. Like the Judeans before them, though, some of these groups managed to maintain their cultural identity; indeed, Alexander found Greeks still living in central Asia during his campaigns over 150 years later.

These deportations had a number of interesting, if unintended, effects on the development of Western culture, including the spread of alphabetic writing (Aramaic became the lingua franca of all three empires) as well as the transformation of the Jewish conception of YHWH from a national god to omnipotent creator of the universe. In addition, the intermingling of cultures from as far west as Anatolia and the Aegean with those from as far east as India produced a considerable development in the philosophy, religion, and literature of the ancient Near East as a whole.

Phoenician Exploration and Colonization

From their cities in the land known today as Lebanon, the Phoenicians swept westward in search of new sea trade and established colonies all across the Mediterranean. The greatest of these was Carthage in North Africa, located on the point of land that reaches upward from that continent toward Italy, where Rome would one day rise.

Even before Carthage, the Phoenicians had already established a broad network of colonies. Gold, silver, and other goods came from Cadiz in Spain, a city that the Phoenicians called Gadir. Pliny the Elder and others dated this settlement from 1104 BCE. Similarly, the historical founding date for the colony at Lixis (modern Larache) in Morocco is 1180 BCE and at Utica in North Africa is 1101 BCE. It should be noted, however, that archaeological work at these sites has so far produced findings from no earlier than the eighth century BCE. Addressing this issue, historians have suggested that early Phoenician trade may have been conducted at temporary facilities, with permanent structures coming at later dates. Additional archaeological work is needed to clarify what happened during this period. Fortunately, Phoenician pottery found on Cyprus at Kition (modern Larnaca) demonstrates that their trade existed here from the twelfth century BCE. The grand Phoenician temple at Kition, with images of ships carved in stone, reflects the wealth of this colony. From Morocco came exotic spices and from Cyprus came copper for making bronze, while North Africa yielded abundant food and raw materials.

➤ CIRCUMNAVIGATION OF AFRICA

Herodotus described an intriguing voyage around Africa by Phoenician sailors and Egyptian passengers that took place about 600 BCE. They took three years to circle the continent, departing from the Red Sea beside Egypt and finally arriving through the Pillars of Hercules into the Mediterranean Sea. The strongest proof that this journey actually took place is that the entire Mediterranean is well above the equator, so ships headed West always had the sun on their left. Yet on this westward trip below Africa, the Egyptians reported the amazing discovery that the sun was on their right. This means that the voyagers passed well below the equator and lends credibility to their account. More than 2,000 years later in 1497–1498 CE, Vasco da Gama made a similar trip and thought that he was the first to do so.

—Sanford Holst

PHOENICIAN EXPLORATION AND COLONIZATION

The establishment of Carthage in 814 BCE marked the beginning of a dramatically more active wave of Phoenician colonization. These new trading centers included the cities of Panormus (modern Palermo), Solus (Solunto), and Motya in Sicily; Karalis (Cagliari) and Nora in Sardinia; many locations on the islands of Melita (Malta) and Goulos (Gozo) in Malta; Oia (Tripoli), Lep-tis, and Sabrata in Libya; Hippo Diarrhytos (Bizerte), Hadrumetum (Susah), Thapsus, and Acholla in Tunisia; Ikosim (Algiers) and Hippo (Annaba) in Algeria; Tingis (Tangier), Sala (Rabat), Zili (Asilah), and Mogador (Essaouira) in Morocco; Malaka (Malaga), Abdera (Adra), Sexi (Almuñécar), and the island colony of Ibshim (Ibiza) in Spain; and many smaller colonies.

Thucydides tells us that when the Greeks came to colonize eastern Sicily, they found the Phoenicians already living there in trading posts all around the island. However, many of these outposts were eventually abandoned or covered up by later settlers, especially in eastern Sicily. Ancient writers refer to numerous Phoenician trading posts other than the major ones noted here, with Strabo estimating that number to be in the hundreds. The work of finding and excavating them continues today.

During the Punic Wars (264–146 BCE) the growing city of Rome wrested virtually all these colonies from the Phoenicians and built a great empire of its own.

Greek Exploration and Colonization

Greek expansion in the ancient world is characterized by two distinct waves of colonization, one in the eighth century BCE and the other follow-

ing Alexander the Great's conquest of the greater eastern Mediterranean world in the fourth century BCE. Between these two periods, colonization proceeded according to the economic and political expansions of the various Greek city-states into North Africa, the western Mediterranean basin, and the Black Sea region. The spread of Greek culture, trade, and immigrants contributed to the development of these regions of the ancient world and their Hellenistic attributes.

Between 850 and 700 BCE in what is known to historians as the Archaic age, Greek civilization experienced a recovery from political and economic stagnation prevalent in the previous period. Economic prosperity and population growth had contributed to a need for both economic expansion and immigration. Between 750 and 500 BCE, coastal regions around the Black Sea, southern Italy, North Africa, and southern Spain were settled by Greek colonists. Greek colonization was characterized by the dependency on the col-

➤ GREEKS IN THE BLACK SEA

The ancient Greeks' name for the Black Sea was Pontus Euxinus, which means "hospitable." The name is somewhat curious given the nature of the Black Sea and how it is treated in Greek literature. The waters of the Black Sea are considerably colder than those of the warmer Mediterranean already heavily settled by Greek colonizers. The straits of the Dardanelles adjacent to the colony of Byzantium (Constantinople) and the Bosphorus are plagued with tumultuous water currents that were difficult for ships going from the Aegean Sea to the Black Sea. Greeks considered the Black Sea dangerous and mysterious, allowing only epic Greek heroes, such as Jason and the Argonauts, the ability to travel in its confines. While the forbidding nature of the Black Sea discouraged many Greeks to settle there, many settlers from Miletus proceeded to colonize many coastal areas within the region around 700 BCE. In subsequent centuries, many of the established Greek colonies contributed to the diffusion of Greek culture in adjacent regions and contributed to the trade routes established in the region with the greater Mediterranean basin.

—Abraham O. Mendoza

GREEK EXPLORATION AND COLONIZATION

ony to a city-state back in Greece. A Greek *oikist* sent from the founding city-state, typically an aristocrat, was given the responsibility of founding and developing the new city under the authority of the government. The formation of a founder-cult would also establish the civic religion of the nascent colony, further developing its identity as a city in its own right. This new city would have commercial ties and continual immigration from the founding city-state.

Greek expansion during the Archaic period was also characterized by the level of expansion deep into areas distant from the Aegean. Colonies in the Black Sea region, southern Spain, Sicily, and North Africa, while relatively distant from the Greek homeland, retained vital economic and political ties to Greece. They mirrored the simultaneous expansion of Phoenician colonization to areas adjacent to Greek colonization. The development of these regions depended on economic and political tutelage from Greece, leading to the expulsion of natives and the eventual Greek political and economic domination of these new colonial regions in the form of fully autonomous Greek city-states. These colonies were primarily homogeneously Greek, unlike those of the later Hellenistic period.

During the Classical era (ca. 490–350) of ancient Greek history, the expansion of city-state commercial empires characterized Greek colonization. In particular, Athenian expansion emphasized the importance of maintaining colonies for commercial growth. Athens maintained a commercial alliance in the form of the Delian League, which eventually became a military alliance against Sparta. In the wake of the Peloponnesian Wars (431–404 BCE), Athenian control over its former allies became more centralized. Commercial and political control emanated from the dominating city-state over other formerly independent city-states.

In the subsequent Hellenistic period of Greek history (323–31 BCE), Alexander the Great and his successors established far more expansive Greek colonies throughout the Mediterranean world. In his conquests, Alexander established the precedent for the settlement of frontier regions through the use of military veterans. He also encouraged intermarriage with local natives to foster alliances and cultural solidarity under

Hellenistic auspices. His successors, in the form of the Macedonian kingdom of Antigonius, the Egyptian kingdom of Ptolemy, and the Asian kingdom of Seleucus, took this lesson and founded many new cities in this fashion, many named after royal family members to project Greek control (e.g., Alexandria, Antioch, Seleukeia, etc.). The success of these kingdoms rested on maintaining Greek control over the newly subjected ethnicities through political and economic settlement in the form of these new cities. However, the relegation of Greeks to these settlements restricted the expansion of Hellenistic culture to native elites who wished to enjoy the benefits of Greek domination.

Roman Expansion into Northern Europe

As the Roman legions pushed into northern Europe starting in 197 BCE, they brought with them more than just a military presence. The Roman bureaucracy traveled with them, and its policies fostered a resettlement of Mediterranean peoples and their culture northward, the impact of which is still evident.

Greek and Roman historians kept extensive records of this expansion. Writers such as Polybius, Julius Caesar, Josephus, Livy, Tacitus, Plutarch, and Ammianus Marcellinus filled many volumes with information about the spread of the Mediterranean peoples into Europe, and many of these works were preserved by medieval scribes. Archaeological and other evidence clearly shows the reliability of these accounts.

Ruins of the Roman imperial baths at Trier, Germany. Augusta Treverorum, later named Trier, was founded by Emperor Augustus in 16 BCE. Trier became an imperial residence and regional capital of the Roman empire. (Corel)

➤ THE ROMAN VILLA

The villa, a country house built for the upper class, was a popular home for the ancient Romans. In the last years of the republic, villas appear all throughout Italy, and as the Romans spread throughout Europe, so did the villa. Generally, the Romans mention two types of villas, the *villa urbana* and the *villa rustica*. The villa urbana was built in close proximity to cities. These villas did not have enough land to be self-supporting, and the wealthy families that owned them tended to own a villa rustica as well, which would have been run by the servants as a productive agricultural estate. The villa rustica in many ways provided the basis for some forms of medieval architecture. The villa rustica began as a basically defensive structure surrounded by farmland, a form that eventually developed into medieval castles. The less defensive form of the villa rustica was a country estate. This latter form inspired medieval manors, and some were converted for use into monasteries in the Middle Ages.

—Linda Malcor

The Punic Wars of the late third century BCE left Rome in control of most of the Mediterranean, and by 51 BCE Julius Caesar had pushed north to the Rhine. Augustus Caesar, the first emperor, claimed territory as far north as the Danube. In 43 CE Claudius brought Britain and its valuable trade routes under Rome's control, and Trajan conquered the areas north of the Danube that would become Dacia and part of Moesia in the wars of 101–102 CE and 105–106 CE. By the second century CE Rome had reached its greatest extent, and Mediterranean peoples and culture flowed easily throughout northern Europe.

As the Roman legions pushed north, populations followed. Each legion had a large retinue of civilian support personnel and camp followers who traveled with it. The Romans also drew large groups of non-Roman soldiers together, forming them into auxiliary and special units called *numerii*. These units were usually stationed outside their native territory, and when the soldiers were discharged, the pattern was to settle them in regions that needed to be stabilized. Roman roads and the security and stability created by its military presence provided a system by which goods as well as people moved. As the Romans spread, so did their luxury items: bronze, pottery, glass, perfume, jewelry, art, wine, and foodstuffs among other items that the citizens living in the north demanded. Non-Roman nobles began to view such items as a sign of power and wealth and demanded them as well. Religions also traveled the Roman roads. For instance, mystery religions from the Middle East, most notably Christianity, swept into northern Europe.

The Roman plan for drawing provinces into the empire involved the creation of Roman cities. When Rome conquered new territory, several hundred families were enticed to settle at points where there was unrest or some vital interest, such as a port or mine, that needed to be controlled. They created cities, which were staffed with bureaucratic personnel who were drawn from Rome. Non-Roman settlers in such towns often became full or partial Roman citizens, and with citizenship they also adopted Roman culture. Political marriages between Roman noblewomen and non-Roman nobles established

alliances that often led to further Romanization of the native peoples.

Not only did the Romans leave their cities, roads, and aqueducts all over northern Europe, but they also left their language and the bureaucratic divisions they imposed on the northern provinces. As the empire declined, the Christian Church filled the power vacuum, modeling itself on the Roman bureaucratic structure. Latin mixed with local tongues and changed through usage into Spanish, French, and other Latinate languages. Many of the Roman baths and aqueducts continued to function for many years after the western Roman empire no longer existed, and some of the Roman roads are still in use today.

Refugees from the Cuicuilco Eruption

Cuicuilco is the earliest known city founded in the Valley of Mexico between 700 BCE and 200 CE. It was destroyed by a series of volca-

nic eruption associated with the nearby Xitle volcano. Some of its refugees may have helped build the largest city in the pre-Columbian Americas, Teotihuacan, a preplanned city of 150,000 people that emerged between 100 and 650 CE. Historic and archaeological sources date eruptions at 150 BCE, 30 CE, 76 CE, and 300 CE. Eruption evidence includes a massive lava flow covering roughly 30 square miles (80 square kilometers) and a nearby volcanic vent connected to Xitle.

Cuicuilco is significant for various reasons in central Mexican prehistory. In Mesoamerica, it has the earliest written solar date, 679 BCE; the earliest stone pyramid complex at 400 BCE; and the earliest irrigation system and shrine site. Cuicuilco may also be a successor civilization to the earliest Mesoamerican civilization, the Olmec. Moreover, the city has the oldest circular pyramid in the region. Circular structures are often associated with Ehecatl, the wind god, and perhaps later with Tlaloc, as rain god. They later become common in western Mexico cultures. Cuicuilco is located at the southern end of Lake Texcoco in the central Mexico basin at an elevation of over 7,000 feet (2,134 meters). The basin is surrounded by active volcanoes. Its population may have reached 20,000 people and was probably an ancestral home to many elites who founded other city-states in the region. Not surprisingly, the old fire god Huehuetotl was associated with the site when it became a pilgrimage center in post-Classic times.

Recent volcanic research has placed an eruption of Xitle at about 2,000 years ago, roughly the same time that an even larger city-state, Cholula, was impacted by the volcanic eruption of Popocatepetl, yet another active volcano in the region.

LEGENDARY CIVILIZATIONS AND THE CUICUILCO DATING PROCESS

Some researchers believe that Cuicuilco is 10,000 years old. Byron Cummings excavated it in the 1920s before radiocarbon dating. Cummings believed that artifacts dated the site to 2,000 years ago but that sediments formed with the volcanic debris took 8,000 years to deposit, making the city an incredible 10,000 years old. Radiocarbon dating

in the 1960s and 1994 redated Cuicuilco from 700 BCE to 300 CE. However, recent writers interested in legendary ancient civilizations prefer to cite Cumming's early dates and avoid the later radiocarbon dates. Thus, you will see Cuicuilco sometimes incorrectly cited as a 10,000-year-old city!

—Christopher Howell

If accurate, both Cuicuilco and Cholula refugees may have migrated to Teotihuacan. Cholula was already replacing Cuicuilco as a major power with the 150 BCE eruption of Xitle. Volcanic activity from two volcanoes within the same human generation may have put too much stress on the food production of the region. Refugees then moved to the north end of the basin and helped expand Teotihuacan. This would help explain Teotihuacan's great size, multiethnic character, and preplanned urbanism. Xitle was eventually covered by volcanic flow and became a major pilgrimage center. Cholula, located in the next valley east of the volcanic Lake Texcoco basin, eventually returned to power and was the second-largest center in Aztec times, known for massive pilgrimage festivals.

Researchers have suggested that city planning, celestial alignments, ceramic styles, and Mesoamerican elite marriage practices all tie Cuicuilco refugees to Teotihuacan. The highly active volcanic region periodically disturbed this growing basin of central Mexico and has complicated archaeological abilities to decipher the migrations of peoples at Cuicuilco, Cholula, and Teotihuacan.

The Settlement of the Caribbean

At about 1000 BCE during what archaeologists call the Archaic Age, the Caribbean islands were sparsely populated by Amerindians who lived mainly in small extended family groups and moved frequently within and between islands. Interisland transportation and travel was frequently based on stone tool materials found at sites far from their geologic sources. This evidence for trade and direct acquisition of raw materials suggests regular navigation of maritime

routes, most likely by canoe. These preceramic Archaic Age Amerindians were still present when the islands were first colonized by larger populations of pottery-making farmers around 500 BCE.

This second major wave of colonization initiated what archaeologists refer to as the Early Ceramic Age, which continued until around 300 CE. Contemporaneous dates for sites attributable to the two culturally distinct populations indicate that they likely coexisted in the region for several centuries if not longer. Based on the stylistic similarity between finely made ceramic vessels with polychrome white-on-red painted and incised crosshatch designs found at archaeological sites in the Antilles and artifacts from sites in mainland South America, the first Ceramic Age populations to travel to the islands originated from the Orinoco River region of what is now Venezuela. The migration of these people into the Lesser Antilles and up the archipelago was a purposeful and rapid process.

In just 400 years, by around 100 BCE, large settlements had been established up the island chain from Trinidad in the south to Puerto Rico in the north. Colonization was made easier by the closeness and visibility of islands to one another, with only a few major open water gaps. These seafaring peoples settled in large circular villages such as that recorded archaeologically at the Trants site in Monsterrat and the Maisabel site in Puerto Rico. While watercraft from this period have yet to be recovered, Amerindians of the Early Ceramic Age likely traveled in large oceangoing dugout canoes such as those recorded for the Taino who, a millennium later, were the first Caribbean peoples to encounter Christopher Columbus and other Europeans. Stylistic similarities between artifacts recovered from sites on distant islands indicate a high degree of maritime travel, trade, and overseas communication. For several centuries following initial migration and settlement, island colonists of the Early Ceramic Age traveled back and forth to their mainland homeland, transporting exotic trade goods.

In addition to introducing substantial human populations to the islands, the Early Ceramic Age colonists also transported plant species

THE SETTLEMENT OF THE CARIBBEAN

including cassava (manioc) and animals including dogs and agoutis (large rodents). As was recorded for the Taino at the time of European contact, Amerindians of the Early Ceramic Age (and the Late Ceramic Age) likely spoke an Arawakan language. Arawak is the largest family of languages spoken by indigenous peoples of South America.

■ Introduction: Nomadic and Seminomadic People

One of the remarkable changes that took place in the period from 1000 BCE to 300 CE was the growing ability of humans to take advantage of what had previously been marginal landscapes. This is especially noteworthy for the arid and semiarid landscapes of central and western Asia, North Africa, and North America, all regions in which water is abundant only in certain seasons and where permanent settlement involves a substantial amount of alteration to the environment. Rather than alter the environment to suit their needs, some groups chose to develop a nomadic and seminomadic lifestyle that allowed them to take advantage of the landscape in resource-rich seasons and abandon these regions in the times of year when living there was too difficult. In some cases, as with the Bedouin, this involved traveling with herds in such a way as to take advantage of the changing vegetation (needed for their herds to graze) throughout the year. In North America, however, the emphasis was on following the migration patterns of different animals, such as the bison of the northwestern plains. What follows is an exploration of some of the major nomadic or seminomadic groups that first appear in the period from 1000 BCE to 300 CE.

Rise of the Arab-Bedouin Populations

The Arabian Peninsula (Jazirat al-Arab) is the cradle of Arabian culture. The peninsula covers 1,750,000 square miles (4,532,480 square kilome-

ters) and includes a mountain range, Sarat, that reaches from Yemen in the south and runs along the Red Sea to the Mediterranean in the north. The average annual rainfall for the entire peninsula is about 6–9 inches (15–23 centimeters); however, the presence of microenvironmental areas divides the territory among arid and semiarid regions. Two different anthropological niches are also defined by a more urbanized south and the northwest region, where a pastoralist tradition has remained until the present.

The first chronicles that mention the presence of a native population of the Arabian Peninsula, geographically located outside the peninsula itself, are the Assyrians. In 853 BCE sources describe Gindib Arbaya (Gindib, the Arab) who had taken part in the Battle of Qarqar with its 1,000 camel fighters, in support of an Aramean (not Armenian) sovereign of Damascus against the Assyrian king Shalmaneer III (859–824 BCE). Other Assyrian chronicles refer to Tiglath-Pileser III, nicknamed “Queen of the Arabs,” priestess of the Bedouin clan of Qedar, who in 738 BCE had to pay a monetary tribute to the Assyrian empire for having sided against the Assyrians with a Palestinian coalition.

The cultural identity of the first population, of which we possess written sources, are the Banu Taym and the Banu Lihyān (or Dedan, as referred to in biblical sources), who used a Semitic alphabet. However, both of these were sedentary populations who still engaged in pastoralist traditions. The archaeological traces that remain of Tadmor (Palmyra) in Syria and Petra (the famous capital of the Nabatean reign) in Jordan indicate, centuries later, a syncretic civiliza-

tion that was deeply stimulated by contact with the Greco-Roman culture, creating a unique fusion with cultures from the peninsula. The encounter of the Bedouin Arab tradition with the urbanized Hellenistic and Roman culture nevertheless thoroughly modified the lifestyle and pastoralist background of these tribes.

Formation of Indigenous Nomadic Peoples of the North American Plains

The Plains region of North America is defined as the region of tall-grass prairies and short-grass high plains extending west from the upper Mississippi River valley to the Rocky Mountains and from the Saskatchewan River valley in Canada south to the Rio Grande on the Mexico border. Prior to European contact in the sixteenth century from the south and in the seventeenth century from the east, this region was inhabited by the Caddoan-, Siouan-, Algonquian-, and Uto-Aztecan-speaking peoples. These Plains people practiced a subsistence regime based largely on hunting and gathering, with minimal agriculture, along with a cyclical nomadic lifeway pattern. Based on archaeological and ethnological evidence, this subsistence regime and lifeway pattern began during the Early Holocene but did not coalesce into recognizable groups until around 1,000 years before the present.

The entire Archaic, Woodland, and precontact periods on the Plains and adjoining mountains were characterized by band-level-sized groups that continually fragmented and aggregated in response to subsistence resources. This level of social organization continued to be viable across the Archaic because of the wide range

THE BANU GHASSANIDS' REIGN

The Banu Ghassanids were a southern Arabian Christian tribe who emigrated at the beginning of the third century from Yemen to southern Syria and Jordan and became a Hellenized reign incorporated into the Roman empire. Subject to the Romans, the group was able to defend the entire region from Arab invasions, and one of their chiefs became a Roman emperor (with the Latinized name of Philip the Arab [204–249]). Until the Islamic invasion of the seventh century CE, the Ghassanids limited the movements of Arab peoples in the region.

—Marco Demichelis

of alternative food resources available throughout the Plains region. However, the unpredictable nature of both floral and faunal resources each season did not allow any long-term permanency in settlements to form for the Plains people, requiring them to maintain a nomadic and cyclical lifeway pattern.

In the northern Plains, for example, Plains peoples focused much of their subsistence reliance on hunting bison. To make bison the focus of subsistence required the northern Plains peoples to follow the seasonal movements, aggregations, and dispersals of the herds. Of necessity, all their material possessions were portable. During good years the northern Plains people could turn to communal hunting of large animals, but in less favorable periods a return to smaller groups and a more nomadic hunting and gathering subsistence pattern took over.

In the southern Plains horticulture played a much larger role, as archaeologically evidenced by specialized facilities including storage pits and hearths, although hunting and gathering still dominated the subsistence regime. Furthermore, archaeological evidence indicates that the formation of these indigenous nomadic peoples on the Plains brought about an increase in intergroup conflicts as different nomadic groups encountered each other and as they competed for access to bison herds and other natural resources.

Eurasian Steppe Migrations

From the Early Bronze Age to the Middle Ages, nomads migrated in the vast Eurasian steppe belt that extends from Ukraine over southern Russia and central Asia to southern Siberia. In most cases, the direction of the migratory movement was from east (Asia) to west (Europe). However, at least one major migration was directed out of Europe into central Asia. This was the oldest migratory movement of steppe people in world history that is traceable by its archaeological remainders. The movement of early Indo-Europeans from the Russian steppe was directed to the west (i.e., into southeastern and central Europe), starting in the fifth millennium BCE, and later to the east (i.e., into central Asia). Those early steppe nomads have been identified as Kurgan people on the basis of the most typical remainder of their culture: huge burial mounds known as kurgans, a term of Tatar origin. Kurgans were built by nomads over a long period and were also built by the Scythians.

Numerous groups migrated in the steppe zone of eastern Europe and central Asia in later periods. The names of many of those steppe migrants have not come down to us. The only populations known by their names are those whose movements have been recorded by authors and chroniclers in the literate societies with which the nomads came in contact. This is true for the

Scythians, the Sarmatians, and others. The people in the state-level civilizations (i.e., classical Greece, Assyria, China) took notice of the nomads from the steppe because the so-called barbarians impressed their neighbors with their mobility, their skills in horse riding, and their use of the bow and arrow. The steppe nomads were feared by their enemies and highly appreciated by their allies.

The ethnic composition among the groups of steppe people was diversified, and a name such as "Scythians" cannot be compared to modern labels of national unity such as "Greeks," "Russians," or "Finns." Often, the group that is mentioned in antique sources was the elite of a conglomerate of groupings of diverse ethnic affiliation. This is true in particular for the Scythians and Hsiung-nu (i.e., Huns). The Hsiung-nu would not have been in the position to threaten both the eastern Roman (Byzantine) empire and western Rome without their command over various kin groups and the allegiance of foreign ethnic groups.

In the chronological sequence, the Cimmerians (called Gomer in the Bible and Kimmerioi by the Greeks) were the first steppe people to exert political influence in southern Russia. They controlled the northeastern shores of the Black Sea. The memory of the Cimmerians lives on in the name of the Strait of Kerch, which separates the Black Sea from the Sea of Azov. The ancient Greeks called that strait Bosphoros Kimmerios. The Cimmerians destroyed the Phrygian kingdom in Anatolia and were later driven off by the Lydians. After circa 600 BCE there is no more reference to the Cimmerians in sources.

The history of the Scythians (who called themselves Skolots) is complex since it is divided between the main group in Europe and another group in central Asia. Their homeland is the steppe zone of southern Siberia. From there, the early Scythians—tribal groups of Iranian ethnic stock—migrated to the west and reached eastern Europe soon after circa 1000 BCE. Those Scythians who remained in Asia later became known as Scythians of the Altai. The oldest references to the Scythians in Europe (called Skuthai by the Greeks and later Scythae by the Romans) date to the sixth century BCE (by Anakreon) and the fifth century BCE (by Herodotus).

The Scythians took control over the steppe zone, ousted the Cimmerians in the mid-seventh

century BCE, and founded their first kingdom. With their political power increasing, the Scythians enlarged their territory and, in the sixth century BCE, even threatened the Persian empire, which prompted a military campaign of the Persian king Dareios I against the steppe people (in 514 BCE). From the fifth century BCE onward, the Scythians came under military pressure from the Macedonians in the west and the Sarmatians in the east. The Scythians withdrew to the Crimean Peninsula, where they founded their last kingdom. In the third century CE the Crimea was conquered by the Goths, and most of the Scythian population migrated to the area north of the Caucasus, where the remainder of the ethnic group became involved in the ethnic formation of the Ossetian people.

The Sarmatians (called Sauromatai by the Greeks and Sarmatae by the Romans) were known to the Greeks since the fifth century BCE. Like the Scythians, the Sarmatians were of Iranian affiliation, and the languages of these two peoples are akin. Among the Sarmatian warriors, there were special detachments of women. The Greeks thought that those women warriors were the Amazons whom they knew from their myths, and the Scythians believed that the Sarmatians were the descendants of Amazons and Scythian men. These popular beliefs added to the appreciation of Sarmatian warriors and their valor.

Since the second century BCE, the Sarmatians engaged in continuous military clashes with the Greeks in the colonies on the northern shore of the Black Sea. In the third century CE the Sarmatians lived under Gothic supremacy, and later the political pressure of the Huns made the Sarmatians withdraw to the northern Caucasus. The rest of their population also participated in the formation of the Ossetian people.

On the eastern periphery of the Eurasian steppe belt, groups of nomads formed an alliance in the third century BCE; engaged in border clashes with the Middle Kingdom, China, under the Han dynasty; and prompted counterattacks by the Chinese Army. The political leadership of the nomads lay with a group that is known as the Hsiung-nu from Chinese sources. Ethnically, the Hsiung-nu were the earliest iden-

➤ HELLENIZED SCYTHIANS—THE ACCULTURATION PROCESS OF SCYTHIANS IN THE GREEK COLONIES

In the cultural memory of later periods, the Scythians have been known as steppe people, as nomads whose mobility relied on horse riding. And yet the true picture of Scythian civilization is much more varied. In contact with Greek culture, some groups of Scythians also adapted Greek lifeways and became sedentary themselves. The process of acculturation was amplified when the Scythian aristocracy settled down in the Crimea. There, the third Scythian kingdom was founded in the third century BCE, with Neapolis Skythike (near present-day Simferopol) as its capital.

During the times of the Scythian presence in the Crimea, a bilingual and bicultural community emerged. Scythians married Greeks, and their offspring grew up in two cultures and with two languages. Those acculturated Scythians were called Ellenes Skuthai (Hellenized Scythians). The interaction of Greek and Scythian cultures becomes visible in the handicraft for which the Scythians are famous: metalworking (of gold and silver). From the motifs for decoration and their compositions as applied on vessels (i.e., gorytoi, rhytons), bracelets, and diadems, it is evident that the workshops where these pieces were crafted “employed craftsmen of diverse origin, including Bosporan Greeks and Scythians.”

tifiable group of Turkic peoples. The Chinese succeeded in defeating the steppe people, and their alliance dissolved. The majority of the Hsiung-nu started migrating to the west. They moved through central Asia and reached the Volga River in southern Russia around 350 CE.

They continued their migration into central Europe and established their political center in southern Hungary. The Greeks called the intruders Unnoi, while the Romans called them Hunni (hence the name forms in Western languages). In the early fifth century CE, the Hunnic state extended from the Rhine Valley in the west to central Asia in the east. Like their predecessors

in the eastern steppe, the Huns of Europe also formed an alliance. Under Hunnic political leadership were united groups of various ethnic affiliation: Turkic (e.g., Onogurs), Iranian (e.g., Sarmatians), Slavs (e.g., eastern Slavic groups), and Germanic tribes (i.e., Ostrogoths, or eastern Goths and Gepids).

Chinese chronicles of the Han dynasty mention the Yuezhi who settled in the Gansu province. In 176 BCE the Hsiung-nu defeated the Yuezhi and drove them to the west. The majority of the Yuezhi migrated to central Asia, where they founded new homesteads in the valley of the upper Oxus. The area of new Yuezhi settlement that extended in the south of Uzbekistan and Tajikistan and into northern Afghanistan is known as the historical landscape of Tocharistan. The Yuezhi were also known as Tocharians. Their language and culture, though, were different from those of an Indo-European people who settled in the area in a later period (sixth to eighth centuries CE). Their name was confounded with that of the genuine Tocharians (Yuezhi). The Tochari-

ans of Indo-European affiliation migrated to central Asia from eastern Europe and became known to the world by their well-preserved mummies, the mummies of Ürümqi.

■ Introduction: Armies and Associated Travelers

Along with the vast empires that appeared from 1000 BCE to 300 CE rose great armies that traveled long distances in order to acquire and keep those empires. This is truly a remarkable change from what had come before. Although the ancient Egyptians had in earlier times kept small standing armies or platoons in parts of their empire for extended periods of time, the distance traveled and the size of the armies was significantly smaller than the traveling armies that appeared in this period.

Perhaps the most remarkable of these traveling armies was that of Alexander the Great, which traveled from Macedon to as far away as India and Afghanistan. Alexander's Army suffered what one would expect from an army that traveled so far from home: homesickness and weariness of traveling to distant lands. These were substantial problems for the traveling armies in this period, a period that lacked fast

overland transportation technology. Similarly, supply lines were also problematic; thus, it was important to keep control of the vast distances that the armies traveled. However, most of the supplies for the traveling armies came from the spoils of the conquered lands; food, shelter, and payment usually came when a city was conquered. The Romans were exceptional in this way in that their army, composed of professional soldiers, for the most part received payment directly from the state infrastructure.

As these armies spread to far-off locations and as those same armies spent longer periods of time in the new region, they brought their culture and values to these new locations. This is most apparent in the Hellenistic and Roman armies that spread Greek and Roman culture throughout Europe, western Asia, and North Africa. Mediterranean institutions (such as baths and amphitheaters) were built in these distant lands,

Mediterranean products were imported into these lands, and even the languages of Greek and Latin became the dominant languages in the territories held by Greeks and Romans outside of Greece and Italy. While the changes brought by the Greek and Roman armies are the most apparent to historians today, it is without a doubt that the traveling armies in other regions similarly spread their own cultures to newly conquered lands.

—Kevin M. McGeough

Alexander the Great's Military Forays into Asia

Greek military incursions into Asia occurred under the leadership of Alexander the Great (356–323 BCE), resulting in the integration of the former Persian empire and vast tracts of central Asian territories bordering India. His multiethnic armies, composed of his Macedonian troops, hoplites from various conquered Greek city-states, and eventually Persian cavalry, moved eastward from 334 to 323 BCE, steadily accumulating territories and founding new cities. This massive expansion resulted in the extension of Hellenistic civilization, trade, and migration eastward. The defeat of the Persians and his campaigns in central Asia proved successful until the exhaustion of his multinational troops ended his wars of expansion.

Following the conquest of the Greek city-states, Alexander mustered Greek troops in his plans to invade the Persian empire. In 334 BCE he led an army consisting of 30,000 hoplites and 5,000 cavalry troops into Asia Minor. He planned to destroy the Persian Army in a swift and effective campaign. Unwilling to rely on the Greek Navy, he decided to engage the Persians entirely with a land campaign. His first engagement with the Persians was at the Granicus River near the Hellespont in 333 BCE. There he smashed the Persian cavalry along with its Greek mercenary contingents. Alexander proceeded in a piecemeal fashion to conquer the Greek city-states in Asia Minor from the Persians. He then moved to confront a large force of Persians led by Darius III at the Battle of Issus in 334 BCE, which resulted in a decisive defeat for the Persian forces. Alexander then proceeded through the

➤ ALEXANDER THE GREAT'S EMPIRE, 323 BCE

Macedonian king Alexander the Great not only managed to unite the entire Greek world under his authority but also successfully conquered the territories of Egypt, the Levant, Mesopotamia, and Persia and regions of central Asia bordering India.

—Abraham O. Mendoza

Levant and into Egypt, adding those dominions to his already enlarged empire.

In 331 BCE Alexander advanced his armies northward through Syria into Mesopotamia. Crushing more Persian forces along the way, particularly at the pitched battle at Gaugamela, he conquered Babylon and moved into the Persian heartland. Entering Persepolis in the Iranian plateau, his forces had finally destroyed Persian hegemony over western Asia. Darius took flight but was betrayed by his men and stabbed to death in 330 BCE. Subsequently, Alexander decided to ensure the protection of his domains by ending the incursion of nomadic invaders from the north and the east through conquest of regions farther east. From 330 to 323 BCE his forces pushed into Bactria, Media, and the banks of the Indus River. Some of his Macedonian subalterns began to have doubts over his strategy and his adoption of Persian mannerisms. He had also solicited Persian regiments into his armies. Despite grumblings and instances of near treason, Alexander held a tight grip over his forces.

In the years between 330 and 327 BCE, Alexander succeeded in crushing the remnants of the Persian forces holding out in the northeastern provinces of the former Persian empire. At this point, he was ready to prepare for the conquest of India. After defeating a local Indian ruler in 326 BCE at the Battle of Hydaspes, Alexander's armies would fight no more, forcing a retreat. Returning to Persia, Alexander decided to consolidate his holdings by promoting policies of intermarriage between Greeks and non-Greeks and founding new cities to be inhabited by army veterans and Greek settlers.

Spread of Hellenistic Culture

As Alexander the Great (Alexander of Macedon) and his armies crossed the Hellespont in 334 BCE and subsequently conquered Asia Minor, Syria, Egypt, Mesopotamia, and Persia, a significant process of cultural diffusion of Hellenistic (Greek) culture enveloped a vast geographical span, well to the borders of India. In the Hellenistic successor states of this region that followed Alexander's death this process continued, at least in major cities composed of Greek settlers. In spite of the prevalence of Greek culture, religion, language, and learning in major cities of the Hellenistic world, much of this was limited to Greek settlers and native cosmopolitan elites who assimilated Greek ways. Many of the non-Greek native populations of these newly colonized regions, in places such as Egypt and Palestine, resented foreign rule and its associated cultural Hellenistic forms and preserved their own cultural forms and paradigms.

As the Persian empire succumbed to the rule of Alexander, the entry of Hellenistic culture into its various regions followed. Following Alexander's death, the successor kingdoms of the Seleucids (312–63 BCE) and the Ptolemies (305–30 BCE) also propagated Hellenistic learning, language, and philosophy within their realms. However, there was already familiarity with Greek culture, as these regions already had long-established trade networks with Greek cities. The main difference was the impact of Greek settlers, many of them former soldiers, in these regions. As these Greek settlers entered Egypt, Persia, Syria, Palestine, and Mesopotamia, they founded Greek cities and retained Greek culture with many non-Greek native elites who had recognized Greek sovereignty, adapting to the culture of their new foreign leaders. The most successful Greek settlement of this period, Alexandria in Egypt, became an important hub for trade and culture in the Hellenistic world. The only other Ptolemaic settlement, aptly named Ptolemais, was a small town and never reached the stature of Alexandria. In the Seleucid provinces of Syria and Mesopotamia, the Seleucids founded the cities of Antioch, Seleucia, Apamea, and Laodicea, which consisted mainly of Greek settlers. The Seleucids also founded several military settlements named after Greek or Macedonian cities, and these were basically towns. However, in spite of the number of Greek settlers, they never amounted to more than a fraction of the large populations of non-Greek natives in the provinces, which preserved their own cultures while viewing Greek settlers with suspicion.

As the influx of Greek merchants, soldiers, and settlers entered Persia, Mesopotamia, and Egypt following Alexander's death, they along with native elites created a hybrid culture dominated by Greek cultural forms. The primacy of the Greek language, art, religion, and philosophy influenced the conquered cultures, but the new culture also incorporated ideas and practices from these conquered territories. The Greek language provided a powerful conduit for the spread of Hellenization in the successor kingdoms. As Greek was the official language of bureaucracy, the upper levels of government administration, and the sovereign, it was neces-

➤ SELEUCUS I NICATOR

Seleucus I (ca. 358–281 BCE) was one of Alexander the Great's top Macedonian generals who served with distinction in the campaigns in India. Following Alexander's death in 323 BCE, Seleucus squabbled with the other major generals over the spoils of conquest and managed to retain the largest portions of the new empire. These included Persia, Mesopotamia, Palestine, Syria, and the regions bordering on India. He established the Seleucid dynasty, which reigned over these immense regions for almost three centuries (312–63 BCE). Seleucus's greatest contribution to the spread of Hellenism was in continuing Greek settlement throughout his dominions. This ensured the diffusion of Hellenistic culture. In spite of his efforts, the vast majority of his subject populations

Seleucus I Nicator was the king of Syria from 312 to 281 BCE and founded the Seleucid empire. Roman copy of an original from the second century BCE. (Jupiterimages)

continued to preserve many of their own non-Greek native cultures amid the rapid acculturation of their elites into Hellenistic civilization.

—Abraham O. Mendoza

sary to learn the language as a means to work within the confines of the government apparatus. Non-Greek native elites seeking to work within or function in Hellenistic society, mostly to profit and retain their privileges, took to learning Greek and adopting elements of Hellenistic culture. In Ptolemaic Egypt, local scribes fluent in Greek worked to translate the grievances of local Egyptians to the Hellenistic administration. Greek education and Greek learning, primarily through the establishment of schools and academies modeled on that of Athens, promoted the diffusion of Greek philosophy, history, and language throughout the successor kingdoms. The Library at Alexandria serves as the most notable example of the importance of learning as a means to spread and propagate Hellenistic culture throughout the Mediterranean littoral, as scholars from regions came here to exchange ideas.

Intermarriage with the local populations, while considerable, was not widespread enough to create a significant change in the view of Greeks in the native populations. Greek intermarriage with subject peoples was promoted by Alexander, who married a Persian princess himself. Although the Greeks did view many of their subject peoples as barbarians, those who were willing to adopt Greek culture and language

were sometimes viewed as akin to Greeks. On the other hand, Greek supremacy was viewed by many subject peoples, such as Persia, as evidence of their greatness in comparison with their own decline prior to Alexander's conquests. While resentment remained, this attitude helped many elites rationalize their own adoption of Greek culture as their own. In contrast, resistance to Seleucid political power and religion in Palestine by the Maccabbes (167–160 BCE) illustrates that not all non-Greek elites viewed Hellenistic authority with admiration, especially when it trampled on long-standing religious traditions.

As Greek soldiers followed Alexander into India, many of them also stayed and settled. Greek coins and artwork illustrate the cultural exchanges that existed between the Hellenistic kingdoms and Mauryan India. Significant Greek populations settled in the northwest, allowing for the spread of Hellenistic religion, language, and philosophy into this particular region of the Indian subcontinent. However, these Greek settlements slowly assimilated to native ways, creating a more syncretic regional culture while retaining minor elements of Hellenistic culture evident in art, religious practices, and language.

Roman Military Movement around the Mediterranean and Europe

Throughout the existence of both the Roman republic and the subsequent Roman empire, there was considerable military expansion carried out by Roman legions throughout the Mediterranean basin and Europe. The Roman republic engaged in wars of expansion to ensure its defense and later for the sake of expansion. The Roman empire pursued territorial gains to ensure Roman hegemony over the known world. In the midst of these wars of expansion for nearly a millennium, Romans managed to attain rule over vast areas of Europe, North Africa, and the Middle East.

Roman expansion began within the confines of the Italian peninsula. Rome was situated in the crossroads of Italy, centrally located on an important crossing point along the Tiber River. Having expelled the Etruscans around 509 BCE and established the Roman republic, the nascent city-state began its ascent as the greatest military power of antiquity. Rome and other Latin cities in the region of Latium were threatened by the Oscans, from the north of Italy, and this resulted in a series of wars lasting nearly a century (ca. 500–400 BCE). The formation of the Latin League, composed of Rome and its Latin allies, led to the expulsion of the Oscans and the eventual domination of the Latin cities by Rome. However, the sack of Rome by the Gauls in 390 BCE led to the dissolution of the Latin League. The revolt of the Latin League was suppressed by Rome between 340 and 338 BCE with the assistance of its Samnite allies. In order to placate the Latins, Rome granted them citizenship and the amenities that came with it. Further conflicts with the Samnites and Tarentum eventually resulted in Rome's control of the entire Italian peninsula by 275 BCE.

Additional Roman expansion during the years of the republic resulted in massive gains at

the expense of Carthage and the Hellenistic kingdoms of the eastern Mediterranean. The wars against Carthage in North Africa and Spain, known as the Punic Wars (264–241 BCE, 218–202 BCE, and 149–146 BCE), resulted in Roman conquest of its provinces greatly expanding its dominions. Farther east, Rome came into contact with the Hellenistic kingdoms, heirs to Alexander the Great's conquests. Increasing involvement in their quarrels led to eventual Roman conquest and their incorporation as provinces of the Roman empire. Macedonia fell to Rome, having fought as an ally of Carthage. Conflict with individual Greek city-states resulted in greater Roman authority exerted after the Romans stamped out their ability to make war. Such an example would be the sack of Corinth in 149 BCE, which was followed by the destruction of Carthage in 146 BCE. Further wars of expansion were fought under Julius Caesar (100–44 BCE) and Augustus (63 BCE–14 CE), which resulted in the acquisition of Gaul and Egypt, respectively.

The institution of the Roman empire under Augustus resulted in a consolidation of power within the domains attained under the republic and a further expansion in Britain, Dacia, the Levant, and Mesopotamia and regions around the Black Sea in the first and second centuries CE. Although Caesar had first landed on Britain, permanent expansion into Britain was begun during the reign of Emperor Claudius (43–47 BCE). Excursions into the Parthian empire (Persia) resulted in the acquisition of the province of Mesopotamia. Incursions along the Rhine brought the Roman legions into contact with the Germans, whom they held at bay through a series of strategic defenses. The rebellious kingdom of Dacia was defeated and occupied by Roman forces. Where the Romans did not rule directly, they managed to set up client kingdoms, such as Judea under King Herod (73–4 BCE).

Han Chinese Military Movement to the West

Han Chinese military movement to the west was the inevitable result of the war against the Hsiung-nu in the north and northwest, who built their powerful polity a few years before the establishment of the Han under the strong lead of their new ruler. After an unsuccessful military adventure against the new Hsiung-nu polity at the beginning of the Western Han, the Han government had to make a peace with them through marriage and tributes. Such a situation did not dramatically change until the time of Emperor Wu of the Han, when the Han became strong enough to launch a large-scale war against its overbearing neighbor and secure its border. The attack on the Hsiung-nu in a frontier market in the autumn of 129 BCE marked the beginning of a strategic war against this neighbor. In 127 BCE the Han Army, led by the General-in-chief Wei Qing, drove the Hsiung-nu off Erduosi plateau and two commanderies were established soon after the military victory. Several years after this crucial victory, another Han general, Huo Qubing, defeated the Hsiung-nu in the Gansu corridor zone and forced one of their rulers, King Hunye, to surrender soon afterward. All the Hsiung-nu were soon moved out of their territory, including the whole Gansu corridor and the areas west to Luobupo, and four Han commanderies were set up. Following this victory, the above two generals were able to drive the main Hsiung-nu ruler and his court to the northern Gobi Desert area in 119 BCE. Though there was still a long way to go for the Han people to win the war against the Hsiung-nu, these key victories helped the Han government establish a solid foundation on which the Han influences were able to be expanded continually to the west.

The western polities had long been controlled by the Hsiung-nu as an extremely important base against the Han. When the Han government realized this, they sent an envoy team led by Zhang Qian as the representative of the government to seek allies against the Hsiung-nu in 138 BCE. Nevertheless, Zhang Qian and his team were not able to achieve their original goal, for they were detained by the Hsiung-nu for a long time. Afterward he and other team

members fled the Hsiung-nu to the western area and returned to the Han capital, Chang'an, in 126 BCE with invaluable political, social, and economic information on the western polities. Soon after the defeat of the Hunye, Zhang Qian led another envoy to the western zone, and some diplomatic connections were successfully established. This was the beginning of the Han expansion to the western zone.

The decisive win in the western zone came only after their wins in battles. The heavy attack on Loulan and Cheshi in 108 BCE made the western polities aware of what a shocking threat the Han power was. After the successful conquest of the Fergana Valley in the far west in 101 BCE, most of the western polities began to pay tribute to the Han emperor. In order to control the strategic Turfan area, Han military forces had been involved in serious struggles against the Hsiung-nu and local governments from 90 BCE to 67 BCE until it finally controlled that area completely. However, toward the end of the Western Han and the beginning of the Eastern Han when the Han people focused on their internal affairs, the Hsiung-nu regained control of the western zone and again became a serious threat on the western border of the Eastern Han. Like its predecessor, the Eastern Han was forced to initiate a war against the Hsiung-nu since it wanted to secure its border and exert its influence on the western zone. In 73 and 74 CE, General Dou Gu defeated the Hsiung-nu twice and restored Han domination of the Turfan area. The connection between the Han and the western zone was again cut off by the Hsiung-nu in 77 CE, which led to Hsiung-nu's fiasco in war in 89 CE. This definitive victory made it possible for the Eastern Han to employ its full influence on the western zone's polities. During the time when Ban Chao and his son Ban Yong were in charge of the western zone, all the main polities paid tribute to the Han government.

Rise of Militarized Nomads

The rise of the horse-riding nomadic empires in Eurasia had an enormous impact on the nonnomadic peoples they encountered. The increasingly specialized weaponry and growing concentration of wealth among the horse-riding elite set the stage for the horse-riding aristocracy that governed most of Eurasia during the Middle Ages. Treaties formed between the nomadic peoples and their nonnomadic neighbors during the first centuries CE eventually developed into the medieval stratification between the warrior elite and the agricultural specialists and craftspeople who supported them.

Although the first horse-riding nomads concentrated their efforts on herding, conflicts inevitably arose with their nonnomadic neighbors. Most of the nomads ransomed hostages or adopted them into their cultures since they had no means of keeping permanent prisoners. Plunder needed to be small enough to be worn or carried in a wagon, as most of these nomadic groups did not have settlements where large quantities of valuables could be stored. Since

ongoing conflict was impractical, raids tended to be seasonal. Some nomadic empires (such as the Xiongnu) forged treaties to collect tribute from their neighbors. Some groups found a niche protecting the nonnomadic peoples from other nomads in exchange for the goods they needed and the wealth they craved. Iron and gold in addition to foodstuffs were among their favorite items, and some nomads developed a taste for art, particularly that produced by Greek artisans.

The earliest horseback-riding, sword- and bow-wielding steppe nomads whom the nonnomadic peoples of Eurasia noticed were the Scythians. They rose to power in the sixth century BCE and ruled lands from Germania to as far away as Siberia until the third century BCE.

The Scythians were supplanted by the Sarmatians, or “Sauromatians,” who added the kontus, a weapon similar to the medieval knight’s lance, to their arsenal. The Sarmatians were also known for wearing scale armor and using shields marked with tamgas, signs that may have been the inspiration for medieval heraldry. Since the Alans shared a similar culture and fighting style, the groups are often referred to as the Alano-Sarmatians. The Alano-Sarmatians also began their rise to power in the sixth century BCE, but they outlasted the Scythians, maintaining identifiable units until at least the fifth century CE. The Ossetians of the Caucasus Mountains are the modern descendants of the Alans.

The Alans shared traits with the Huns, who arose in Mongolia. While most of the militarized nomads were Indo-European cultures, the Huns spoke an Altaic language. Greco-Roman authors became aware of the Huns in the fourth century CE, and some enclaves of Huns survived in the Caucasus region until the eighth century CE.

The Saka roamed central Asia, but little is known about them since they did not have extensive contact with the Greco-Roman world. The Saka arose in the seventh or sixth century BCE, but by the third century BCE cultural differences caused them to develop into a variety of smaller groups.

Greco-Romans had a love-hate relationship with the nomads. Some of the groups, such as the Sarmatians, controlled vast sources of gold and iron. The Romans often found themselves

➤ WARRIOR WOMEN

The Greek legends of the Amazons likely had their roots in the historical warrior women of the Alano-Sarmatians. According to Herodotus, these women had to kill three men in battle before they were deemed worthy of marrying. Although Amazon legends abound in Greco-Roman writings, few female graves with military equipment have actually been found. The women may have given up their warrior ways upon marriage, rising to defend their herds and offspring only when their men were not around or needed help.

—Linda Malcor

fighting the nomads one moment and allied with them the next. Units of Sarmatians and Alans were also found in the Roman Army. Since most of the nomadic groups of Eurasia did not have a written language, modern scholars rely heavily on the ethnographic records of the Greco-Romans and other adjacent peoples to re-create their histories. Archaeology, toponymy, and anthropology also contribute to what we know about the rise of these groups.

■ Introduction: Pilgrims and Missionaries

The first known pilgrims and missionaries date from between 1000 BCE and 300 CE. Throughout much of Asia as well as southern Europe and North Africa, people began traveling because of their religious convictions to fulfill certain spiritual needs or spread theological teachings to others.

The earliest clear evidence for pilgrimage is in the Greek world, where people would travel long distances to take advantage of the benefits of holy places. In some cases these benefits would be medicinal, as was the case with pilgrimages to sites associated with the god Asclepius. In other cases it would be to gain access to divine knowledge, such as from the oracle at Delphi. Greek travelers also visited important worship sites such as Olympia, long an important location of the god Zeus.

One of the great motivating forces of pilgrims and missionaries in the last half of the first millennium BCE was the teachings of the Buddha. Buddhist missionaries spread the teachings of the Buddha from India through East Asia. As these teachings were spread and Buddhist communities developed outside of India, Buddhists were inspired to travel to experience locations that had become important for their community.

In the first century CE Christianity was born, and almost immediately a missionary and pilgrimage tradition emerged with it. An important component of the beliefs of this new religion was to spread its teachings to others. The first missionary for whom historians have good evi-

dence was Paul, whose work in spreading the teachings of Jesus is preserved in the New Testament. As Christianity spread out of Palestine throughout the Roman world, Christians desired to visit locations that were mentioned in the Bible. Christian pilgrims traveled to these cities, especially Jerusalem, as a means of experiencing the divine and gaining a greater understanding of the teachings of their traditions.

—Kevin M. McGeough

Pilgrimages to Panhellenic Sanctuaries

Sanctuaries and temples dotted the landscape of the ancient Greek world, from the cities of Syracuse in Sicily to Phasis on the eastern Black Sea coast, serving the religious needs of the local people. But some temples had a reputation that extended over the entire Greek world, such as Zeus's sanctuary at Olympia or Apollo's oracular center at Delphi. These sites were termed "Panhellenic," important to all the Hellenes (i.e., to all the Greeks). To these sites the ancient Greeks made religious pilgrimages. Some pilgrimage destinations celebrated regular festivals. These might be annual, biennial, or even, as in the case of the Olympia and the Great Panathenaia at Athens, every four years. Individuals and state embassies would make their way to these sites when the festivals were about to be celebrated. Other sacred sites attracted visitors all year

► WHO WENT ON PILGRIMAGES TO PANHELLENIC SANCTUARIES?

Pilgrimage in ancient Greece involved travel by private individuals or small groups as well as state-appointed ambassadors to various temples and sanctuaries throughout the ancient Greek world. At these sacred sites visitors would worship the gods and often expect specific benefits in return. Pilgrims sought cures at the healing sanctuaries of the god Asklepios, honored Zeus by attending and participating in his sacred games at Olympia, or asked for advice in the form of oracles from the god Apollo at Delphi. The Greeks placed such emphasis on pilgrims and pilgrimages that a sacrosanct truce would be proclaimed a sacred site celebrated its special religious event.

Pilgrims would be required to observe various regulations at sacred sites, particularly relating to the clothes they wore and the food they ate while participating in sacred rites. Some pilgrimage centers were only for certain Greeks such as the festival of Apollo on the island of Delos, solely for the Ionian Greeks, particularly the Athenians and the cities claiming kinship with them. Non-Greeks were not allowed to participate in the Olympic Games or to consult certain oracles. Women were prominent among pilgrims, with their special concerns relating to sanctuaries concerned with fertility and childbirth. While every major town and city had temples, worshippers would nevertheless travel some distance to sacred sites considered to be particularly holy and where the god was believed to be especially powerful.

—Matthew Dillon

round, such as oracular centers and healing sanctuaries. At any one time in the Greek world, there would be numerous people making their way to religious centers for religious purposes. Although the Greeks had a word (*theoroi*) for the official visitors, the term “pilgrims” can be used to apply to all those who went on long journeys to worship the gods.

At Epidauros in southern Greece, the god Asklepios had a famous healing sanctuary to which pilgrims came from the ancient Greek world in search of a cure. Along with the Olympic festival, this was the most common pilgrimage in the Greek world, but unlike with the

Olympic festival, people would travel to Epidauros at any time. Asklepios's cult was basically one of faith healing. Those who were sick made their way on foot or borne on litters and even came across the Aegean in ships to the port that lay 3.7 miles (6 kilometers) away from the site. At Epidauros, they would bathe, make sacrifice, and pray to Asklepios, and then they would go to sleep overnight in a special building known as an *abaton*. Sick and long-suffering, they hoped that the god would appear to them in a dream while they slept. Some may have despaired of doctors or may have simply put greater faith in the god. They hoped that as they slept he would appear to them in a dream and would lay his hands upon them to cure them or that he would speak to them in their dreams and instruct them on a course of action that would cure them.

Most famous of all pilgrimage destinations was the oracular temple and sanctuary of Apollo at Delphi. Consultations took place at the temple on only one day, once a month. Individuals and delegations sent by their states put their questions to a priestess, known as the Pythia, who sat in the temple on a tripod, a lidded cauldron with three legs. She listened to their questions and provided advice, either in verse or in prose. Unlike in later Roman accounts, the Greek historians and playwrights describe her delivering her oracles in a lucid frame of mind in verse or prose, which the listener could easily hear though some degree of interpretation could be required. She was seen to be the mouthpiece of the god Apollo himself, delivering his opinions and advice.

The Greeks believed that the gods took a close interest in mortal affairs and that it was important to avoid offending them and to gain their support by seeking divine approval for undertakings such as the sending out of colonies and declaring war. The longest war in Greek history, the Peloponnesian War of 431–404 BCE between Athens and Sparta and their various allies, was undertaken by the Spartans in 432 only after they asked the god through his priestess at Delphi if they would win if they declared war against Athens. In an enigmatic reply in a style that was not uncommon for her, the priestess told them that they would win if they fought hard. Cities also sent an embassy to Delphi if the

crops had failed, if there was a plague or pestilence in the land, or if there had been some prodigy such as a meteor in the sky. They wanted to know which god to sacrifice and pray to in order to cure the problem or to explain the meteor: was it a sign that they had offended a god and needed to make amends? Private individuals also came to ask the god for advice on personal matters, such as marriage or childlessness.

Olympia in southern Greece was a famous Panhellenic destination, but its popularity was limited to once every four years in late July or early August when the five-day festival in honor of the god Zeus was celebrated. Zeus's temple there housed one of the seven wonders of the world: the seated gold and ivory (that is, chryselephantine) statue of Zeus created by the Athenian sculptor Pheidias in the fifth century BCE. But what people came especially to see were the athletic contests and chariot races. Facilities were primitive, and there were no grandstands, so spectators stood and watched the contests. Most people camped out in tents, some of those belonging to the wealthy being large and elaborate. Official guests were housed in a special hostel.

Contests in particular included the four-horse chariot race, which attracted entries from throughout the Greek world but particularly from Sicily. The tyrants of Greek cities there demonstrated their power and wealth by sending chariot teams and drivers to the motherland. While the mortal pilgrims enjoyed the spectacle, the Greeks believed that Zeus and the gods also watched, taking an interest in the events and their outcomes. Competitors had to swear an oath to Zeus not to cheat. The path to the stadium at Olympia was lined with statues of Zeus known as *Zanes*, which had been paid for by competitors who had cheated: their misconduct was an offense against Zeus. Those who did not compete fairly were known as *mianteres* ("defilers") because they had polluted the festival of Zeus. Athletic and musical contests were held at Delphi for Apollo, and an inscription records the elaborate arrangements that the island of Andros in the Aegean made in sending an official embassy, including a choir, to honor Apollo at his special festival. Pilgrims at these festivals worshipped the gods by spectating and taking part in sacrifices to the gods, who were honored by their presence.

While the official pilgrims were male, women were also active as pilgrims. The cure inscriptions at Epidauros, for example, indicate that women were over one-third of Asklepios's worshippers there. One woman in the fourth century BCE, Andromacha, traveled all the way from northern Greece to Epidauros. Olympias, mother of Alexander the Great, from northwestern Greece, met her future husband Philip while she was participating in the mystery celebrations on the Aegean island of Samothrace; she had traveled several hundred miles to participate in the sacred rites. In the realm of myth, Creousa traveled from Athens to Delphi to ask the god Apollo for advice on having a child. The temple attendant asked her whether she had come to ask about crops or childbirth; her presence and request were not considered to be unusual. While women were excluded from the male world of politics, they had specific physiological and personal needs that were met by religion, and these found expression in their role as pilgrims.

Large numbers of religious devotees, regardless of their piety, created administrative needs and organizational problems for the sites to which they traveled. Sanctuaries had rules regulating the behavior of pilgrims, as misbehavior could be a problem. The priest at the shrine of the healing god Amphiaraos at Oropos, on the border between Thebes and Athens, was authorized to punish slight offenses; others were to be judged by a court. The Athenians empowered the superintendents of the Eleusinian Mysteries to fine those who misbehaved. Officials took care of ensuring that there was an adequate supply of food to be sold during festivals. Markets are known for Olympia and particularly the festival of the Isthmia at the Corinth, where jugglers, fortune-tellers, and peddlers all vied for attention from those who had come from other cities and pitched their tents for the duration of the festival in honor of Poseidon. Some religious rites had provisions regarding the purity and dress of the worshippers. Consultants of the important oracular shrine of the hero Trophonios in Boeotia had to undergo purificatory rites extending over several days, including bathing, and had to wear a linen garment. There were also very specific regulations regarding dress for

the mysteries at Andania that drew large crowds from all over the Peloponnese. These rules were designed to prevent ostentatious dress.

During the long-running Peloponnesian War, the Athenians and Spartans in 421 BCE signed the Peace of Nikias, named after the Athenian general who was its main organizer. Both sides guaranteed that all Greeks would be able to travel in safety to Panhellenic sanctuaries to worship the gods and participate in the major pilgrimage festivals. Pilgrimage was a matter of international concern, and representatives of the cities of both sides swore to uphold these provisions. Sacred truces, as they were called by the Greeks, were also proclaimed before major events. Officials known as *spondophoroi* (“peace bearers”) were sent out by pilgrimage sites such as Elis for the Olympic festival and Athens for the Eleusinian Mysteries, proclaiming that all could travel in peace, unmolested, to the religious events. Any states that did not observe the sanctity of pilgrims and official delegations would be debarred for the future from attending.

Pilgrimage to sacred sites was voluntary and was determined by whether a particular individual could afford the expense. But crowds of thousands attended the Panhellenic festivals, with Olympia often attracting 20,000 or more visitors and the Eleusinian Mysteries attracting thousands as well. Pilgrims were motivated by piety: they wished to express their devotion to the gods so that other people, and of course the gods themselves, would witness it. But pilgrims were also motivated by the need for direct divine assistance (such as the need for a cure) or for guidance (and so sought an oracle). Fundamental to Greek pilgrimage was the notion that a particular god had a particular place where his powers were more efficacious than elsewhere or that specific benefits, such as initiation, were only offered at certain places, explaining the pilgrims’ willingness to travel long distances for religious fulfillment.

Paul the Missionary

Paul the Apostle—the most important of all the early Christian missionaries and theologians, and one of the key writers of the New Testament—has done more than any other individual to shape the history of the Jesus movement. Radically converted to Christ as a young man, Paul devoted the rest of his life to proclaiming Him as the Savior and Lord of the world. The passionate Christ-centered letters he wrote to the early Christians reveals his understanding of Jesus as the messianic redeemer whose atoning death and resurrection offer salvation and life-transforming power to all who put their trust in Him. For Paul, the real significance of Jesus lay not in His earthly life and teachings, but in His death and resurrection, through which God brings salvation to the world.

According to Luke’s account (Acts 22.1–16; 23.6; Phil. 3.5), Paul was raised in a traditional Jewish home and educated in Jerusalem as a Pharisee by one of Judaism’s leading rabbis, Gamaliel. As a zealous young Jew, Paul actively persecuted the early Christians. But as a result of a visionary encounter with the resurrected Jesus (Acts 9.3–19; 1 Cor. 9.1), he came to realize that Jesus is the long-awaited Jewish Messiah and that salvation is mediated through Him—not through careful observance of the law of Moses, as most Jews thought. This understanding, he later emphasized, did not originate in the mind of some human, but was revealed to him by Christ Himself (Gal. 1.12, 15–17). It is his understanding of Jesus—as Messiah, Son of God, Savior, and Lord—that sets Paul apart from his Jewish contemporaries. Everything else—his distinctive views of the law, salvation, and Christian life—is shaped by this insight.

As a result of his visionary experience of Jesus, Paul came to understand salvation as now available to all people, Gentiles as well as Jews, just as the prophets of the Hebrew Scriptures had predicted. In Paul’s view of the new family of Christ, where Jews and Gentiles are united as

► THE LIFE-TRANSFORMING POWER OF THE SPIRIT OF CHRIST

Because God's ultimate goal for His people is that they become like Christ, in Paul's view, believers are called to "put on the Lord Jesus Christ" (Rom. 13.14), to "clothe" themselves with "the new self" (Eph. 4.24) and the characteristics of Christ (Col. 3.12). They are actively to imitate Christ in how they live, just as Paul does (1 Cor. 11.1)—especially in the area of love. When Paul speaks of the imitation of Christ, his emphasis is almost always on the sacrificial love expressed in the death of Jesus, not on the love expressed in His earthly life. Believers are to have the same kind of sacrificial love for one another (Rom. 15.2f., 7; Eph. 4.32; 5.2; Phil. 2.3–8). This selfless, Christlike love is the primary characteristic of the Christian life in

Pauline thought—the single most important virtue for believers to seek (Col. 3.14). Love is the primary ethical expression of Christian faith ("The only thing that counts is faith working through love," Gal. 5.6). For Paul, the law of love is the most important of all the moral commandments in the Hebrew Scriptures (Rom. 13.8–10; cf. Mark 12.31); this principle is what he means by the "law of Christ" (Gal. 6.2). So it is not surprising that love occurs first in his list of character traits produced by the Spirit of Christ in a believer (Gal. 5.22f.; cf. Phil. 1.8). Sacrificial love, above all, is the mark of a life transformed by the Spirit, a Christlike life.

—Roger Mohrlang

God's forgiven people in a single messianic community, ethnic distinctions are no longer significant. One's identity as a person of God is defined only by his or her relation to Christ (Col. 3.11). Convinced that God had called him to proclaim this "good news"—the message of salvation through Christ—to the entire Gentile world (Gal. 1.15f.), Paul devoted the rest of his life to this mission.

Because salvation is for all people, Christ spells the "end of the law" in Pauline thought. No longer is the law of Moses to be understood as the way of salvation or the primary guide for life (Rom. 10.4), as it was in traditional Judaism. Salvation is received personally by faith—that is, by putting one's trust in Christ as Savior—quite apart from one's observance of the law. And a believer's life is now understood as directed and empowered by the Spirit of Christ who lives within, not by the hundreds of stipulations prescribed in the law of Moses (Rom. 7.4–6).

Pilgrimages to Jerusalem

For Jews, Jerusalem in its entirety is considered the holiest place on earth and as such is the real and symbolic religious center to which all Jews yearn to return. It is the highest point in Israel's central mountain range, with views to both the Mediterranean and the Dead seas. It is the traditional site of Mount Moriah, where Abraham bound his son Isaac and was stayed from his sacrifice by the hand of God (Gen. 22:2–19). Jerusalem is situated on the mountain called Zion. Jerusalem was the capital city of King David, the place where he brought the Ark of the Covenant, and the site of the temple that Solomon built to house that ark. In biblical times Jerusalem was the focus of the Shalosh regalim, the three

➤ CHRISTIAN PILGRIMAGE

The traditions of pilgrimage in Christianity developed soon after Jesus's death. At least a thousand years before the Christian era, Jerusalem had been established as the principal holy site of Judaism and the locus of a thrice annual pilgrimage to the Temple to pray, to give thanks for the harvest, to offer sacrifices, and to pay one's taxes. Because so many of the events of Jesus's life and crucifixion took place in Jerusalem and its environs, the continuity of Jerusalem's holiness into the new religion was a natural consequence. Jesus's immediate followers held the places where He had lived, died, and worked His miracles in special reverence. By early extension, the sites connected to the biographies of His apostles, who were venerated almost immediately as saints, also attracted adulation. So, too, did the places considered sanctified by the sacrifice of the early Christian martyrs during the three centuries in which the Romans held the new religion to be illegal. No one knows precisely when the first pilgrimages to the Holy Land began. But by the early fourth century numerous documents speak of the practice in a way that suggests that even though Christianity was still illegal under Roman law, pilgrimages to the Holy Land were long established, common, and therefore unremarkable.

—Linda Kay Davidson and David M. Gitlitz

mandated annual agricultural festival pilgrimages of Passover (Pesach), Pentecost (Shavuot), and Tabernacles (Sukkot).

When Solomon's Temple was destroyed by Nebuchadnezzar II in 587 BCE, initiating the Babylonian captivity and the first of the Jews' many Diasporas, Jerusalem was instantly transformed into the focus of the exiles' longings for return. This emotion is beautifully expressed in Psalm 137: "By the rivers of Babylon, / there we sat down, yea, we wept, / when we remembered Zion. . . . If I forget you, O Jerusalem, / let my right hand wither." In 538 BCE King Cyrus II of Persia let the Jews return, and the Second Temple was built. Since the destruction of that Temple by the Romans, in 70 CE, almost every Jewish religious service in the Diaspora has invoked the longing for return to Jerusalem. The

fourteenth blessing of the morning prayers and the prayer after eating include the passage: "Rebuild Jerusalem, the holy city, quickly in our day." Jewish pilgrims have been returning to Jerusalem over the millennia in ones and twos, in twenties and fifties, to visit the holy city and, if they could, to take up residence there.

A portion of the exiled Jewish community returned from Babylon to Jerusalem in 536 BCE and over the next hundred years completed the Second Temple. In 332 BCE Alexander the Great incorporated the city into his Hellenistic empire. During this long period, and until the suppression of Jewish ritual by Antiochus IV Epiphanes in 175 BCE, the Temple remained the focus of the Jews' thrice-annual pilgrimages to Jerusalem for the agricultural festivals. Greek repression led to the Hasmonian revolt under Judah Maccabee, which recaptured Jerusalem in 164 BCE, cleansed the Temple, and allowed the pilgrimages to continue. If they were able, Jewish pilgrims from cities in Egypt, Mesopotamia, Anatolia, and other parts of the Jewish world came to Jerusalem for the three pilgrimage festivals. If they were not able, they might come just for Passover, or just once in their lifetimes.

The various communities maintained hostels for pilgrims, and several erected communal prayer houses or synagogues for pilgrims from their areas. Care was taken to protect the property left unguarded during the pilgrim's journey (Exod. 34:24). Jews who were unable to make the pilgrimage during their lifetimes might have their ashes sent for burial in the shadow of Jerusalem's walls. The fact that for many pilgrims of this period the visit to Jerusalem was a joyful, spiritual highlight of their lives is reflected in the opening to the pilgrimage Psalm 122: "I was glad when they said to me, 'Let us go to the house of the Lord!' / Our feet have been standing within your gates, O Jerusalem!" The Temple's splendid architecture and sumptuous decoration were also seen by some to mimic heaven on earth or to hearken back to Eden, so that pilgrimages there became a foretaste of paradise or a return to a place in which the relationship between God and humanity was natural, complete, and fulfilling.

The Roman period represents a hiatus between the agricultural festival pilgrimages of

Bible times and the pilgrimages from the Diaspora to visit holy sites. During the first hundred years of Roman rule, at the time of Jesus, Jewish Jerusalem prospered. The schools of the Pharisees, the Sanhedrin, and the splendor of Temple worship began to attract Jewish pilgrims from abroad unconnected with the traditional agricultural festivals. Some established themselves in the city to study, do business, and aid pilgrims from their language groups and preferred modes of worship. Tensions between the Jewish groups added to the general deterioration of the political situation in the 60s and helped to set the stage for open revolt against Rome in 70 CE.

Rome destroyed the Temple in 70 CE and much of the rest of the city of Jerusalem in 135. For the next two centuries the Romans barred both Jewish and Christian access to the holy sites of the city.

Early Buddhist Missionary Activity

Since its inception, Buddhism has been a remarkably successful missionary religion. For 45 years, from shortly after his enlightenment (*bodhi*) in circa 400 BCE until the end of his life, the Buddha traveled throughout northern India teaching and winning over converts and supporters. Like other renouncers of his day, the Buddha had no permanent home, and he traveled light, carrying few possessions besides his begging bowl and robes. He sometimes traveled alone or with one or two companions, but often he trailed hundreds and even thousands of monks and nuns in his ever-growing community, the *sangha*.

The Buddha wanted his teachings, the *dharma*, to be made available to all, and he considered missionary activity to be a crucial responsibility of his followers. Once he had gained his first 60 disciples, he immediately sent them into the world to spread the dharma and to gain new adherents. Monks zealously followed this injunction year in and year out until lay supporters complained that to travel during the monsoon months was unseemly for peaceable renouncers, given that travel during the rains meant trampling over the many insects born during this time. So the Buddha prohibited all monks and nuns from traveling during what was termed the rains retreat. This served the additional function of centering the monastic community and counterbalancing its constant movement and dispersal during the rest of the year.

After the Buddha, the most effective missionary for his religion was the great Mauryan king Aśoka (third century BCE), whose edicts, carved in pillars and stones erected across a vast empire, pronounced his support of Buddhism and his disapproval for Brahmanical animal sacrifice. He sent his son Mahinda as a Buddhist missionary to Sri Lanka, a Buddhist nation to this day. He planted trees for shade and dug wells along the travelers' routes throughout his lands, and Buddhist missionaries clearly took advantage of these avenues to establish the Buddha's dharma.

Buddhism flourished under the Indo-Greek Bactrians and expanded exponentially as trade

EARLY BUDDHIST MISSIONARY ACTIVITY

grew under the Kushan empire (first to third centuries), when all of northwestern India was plugged into the branch of the Silk Roads that came down from the Taklamakan region through these areas in today's Afghanistan and Pakistan. Old Buddhist monuments are prominent across central Asia, Afghanistan, and Chinese Turkestan. From there, Buddhist missionaries were able to move farther eastward

still into China proper. Some early translators of the dharma into Chinese gained fame there during the second century, beginning not with an Indian but rather a Parthian known to Chinese history as An Shigao and followed by the great Dharmaraksa. Both established large schools of translation so that by the end of the fourth century more than 1,500 Buddhist texts had been translated into Chinese. By the mid-third cen-

➤ AŚ OKA'S ROCK EDICT XI

Pillar edict of Emperor Asoka, Mauryan dynasty, probably from the Meerut Pillar, Ut, 238 BCE. The inscription is in Brahmi, the ancestor of all modern Indian scripts. (British Museum/Art Resource, NY)

The Buddhist edicts of Mauryan king Aśoka (third century BCE), were carved in pillars and stones erected across the vast Mauryan empire. The following is one such carving.

“King Priyadarshi says:

There is no gift that can equal the gift of Dharma, the establishment of human relations on Dharma, the distribution of wealth through Dharma, or kinship in Dharma.

That gift consists in proper treatment of slaves and servants, obedience to mother and father, liberality to friends, acquaintances, relatives, priests and ascetics, and abstention from the slaughter of animals.

Father, son, brother, master, friend, acquaintance, or even neighbor ought to say, ‘This has merit. This ought to be done.’

If one acts in this way, one achieves by the gift of Dharma happiness in this world and infinite merit in the world to come.”

Aśoka inscriptions were influenced by his Buddhist leanings but tended to express a general morality that would have been acceptable to most if not all of his subjects. Important exceptions include his prohibition of the slaughter of animals and his equal respect for all religions, both of which indirectly countered traditional Brahmanical practices and beliefs.

Early Buddhist Pilgrimages

The main sites for Buddhist pilgrimage are places sanctified and empowered by the Buddha's presence both during his life and after his final passing into nirvana. The *Mahāparinibbana Sutta*, which tells the story of the Buddha's final days, records the Buddha himself recommending that his relics be placed in a burial mound called a stupa for the benefit of those who wish to come to pay their reverence. He also recommended that dedicated followers

➤ MAHABODHI TEMPLE, BODH GAYA

The Mahabodhi Temple at Bodh Gaya commemorates the Buddha's enlightenment. The main objects of worship here are the throne and tree that framed where the Buddha sat for this greatest meditation session ever. A cutting of the original Bodhi tree is said to have been brought by Mahinda, the son of King Aśoka, as part of his mission to Sri Lanka in the third century BCE. Descendants of that ancient tree remained a major site of pilgrimage in Sri Lanka even after Buddhism had essentially died out in India (by the fourteenth century). When the ruins at Bodh Gaya were discovered by British archaeologists in the nineteenth century, a cutting from the Sri Lankan tree was planted at the site of the Mahabodhi Temple pictured here, and Bodh Gaya once again became the most prized destination for Buddhist pilgrims.

—Jonathan C. Gold

Mahabodhi Temple, Myanmar. (Pavel Pospisil)

should visit in particular the locations of especially significant events in his life: his birth at Lumbini, his enlightenment at Bodh Gaya, his first sermon at Sarnath, and his passing at Kushinagara. Those who died on a pilgrimage to these sites, he said, would be reborn in a heavenly realm. Lumbini is in Nepal, the others in India. The most sacred site is Bodh Gaya, where the Buddha achieved enlightenment sitting on the Diamond Throne (*vajrasana*) under the Bodhi tree. Other early pilgrimage sites include places where the Buddha is said to have performed miracles and left his footprints in stone.

In one of his famous edicts, the great Mauryan king Aśoka (ca. 269–ca. 232 BCE) declares

that rather than engaging in the royal pleasure tours of the past, he has become a religious devotee and now regularly undertakes a religious tour (*dharmayatra*) instead. Aśoka was not exclusively a supporter of Buddhism, but if we interpret his religious tour as a Buddhist pilgrimage, then Buddhist pilgrimage enters the historical record with the very earliest datable Buddhist source. Pilgrimage sites helped to cement trade routes both within India and with its neighbors and eventually all along the eastern branches of the Silk Roads, and in turn better-established trade routes allowed for the increasing popularity and ease of pilgrimage. Already by 300 CE, Chinese and central Asian Buddhist

pilgrims were tracing back the travels of the Buddhist missionaries who had brought Buddhism to them from central Asia and India, respectively.

Buddhist pilgrims seek out the physical presence of the Buddha. The fact that the Buddha, having entered final nirvana, might be absent from the world and therefore beyond the reach of devotees has caused more consternation among scholars than worshippers. Few premodern Buddhists seem to have doubted the effectiveness of receiving the Buddha's blessings at his pilgrimage sites.

■ Introduction: Changes in Trade Networks

One of the strongest motivating forces for travel from 1000 BCE to 300 CE was trade. Throughout this period, the globe became connected in a way that it had never before been connected as new trade routes were opened up and new trade networks were developed. The most significant of these networks was the Silk Roads, which connected the vast continent of Asia with Europe. While few people (if any) would have traveled the length of this route, these networks allowed goods to travel from the most distant regions in China to the farthest regions of the Roman empire.

The Americas also became increasingly more connected at this time. There is evidence for trade connections throughout Mesoamerica. Some trade is also in evidence between Mesoamerica and South America as well as from Mesoamerica to some of the southern reaches of North America. The south and eastern portions of North America were well connected through trade networks in the first few centuries of the Common Era.

Other significant changes in trade networks came with the development of new transportation technologies. The domestication of the camel allowed large expanses of arid land to be

traversed, opening up new trade routes. New understandings of monsoons allowed new seasonal travel. River and sea transportation in Europe and Asia also allowed greater flexibility of movement.

—Kevin M. McGeough

Formation of the Oasis Trade Network across Central Asia

Although the Silk Roads connected China and the Mediterranean Sea through the medium of the oasis towns of central Asia, it is difficult to conceive of the Silk Roads cohering without the domestication of camels, particularly the Bactrian camel. With an arid but often cold climate and with many deserts, central Asia could be a difficult region to traverse.

Horses were too high-maintenance, as they required a considerable amount of water and fodder. When traveling through desert or semi-desert regions, merchants had to transport food and water for the horses, thus requiring more animals for that purpose. The Bactrian camel, however, can carry a considerable load as well as survive days without food or water. In addition, the camel possesses thick pads on its feet

OASIS NETWORKS ACROSS CENTRAL ASIA

that allow it to traverse the sand and stones of the desert with ease.

With the use of the camel, Chinese merchants could now cross central Asia. Although they tended to avoid crossing the Taklamakan Desert, the camel allowed them to skirt the edges and thus make contact with the oasis towns of central Asia. From the west the camel, both Dromedary and Bactrian, allowed merchants from Iran to cross not only the deserts in Iran but also the Kizilkum Desert in central Asia. At the same time, the desert benefited trade. Whereas the oasis towns were sources of water, food, and commerce, the deserts held fewer predators than routes across the steppes. The camel greatly facilitated the use of the routes that skirted the desert from China to central Asia but also those through Iran from the West and even routes from India.

During the first and second centuries BCE, central Asia consisted of small kingdoms, particularly in the regions of Bactria and Sogdiana. Their cultures were strongly influenced by Iranian culture and Hellenism. With such a syncretic atmosphere, it was relatively easy for a variety of merchants from the western lands to do business with Chinese and Indian merchants. This is not to say that no issues arose. The Parthian empire (247 BCE–224 CE) greatly supported the trade routes in the portion of central Asia it controlled. The Parthians established caravanserais at many oases along the trade routes. However, they were often accused of reserving use of the routes for their own merchants and discouraging foreign merchants as much as possible.

> CARAVANSERAIS

Caravanserais were the truck stops of their era. Found at most oases along trade routes, a caravanserai provides food and shelter for merchants as well as a safe area to keep their goods and animals overnight. Routes that had caravanserais saw increased use due to the assurance of shelter and provisions. Furthermore, caravanserais served as information clearinghouses, as merchants could exchange news of the territories they had recently passed through.

Although the Parthians and the Hans built caravanserais to promote trade through their territories, in central Asia they were built and maintained by local notables. Managing a caravanserai could be a very lucrative business. As with restaurants and hotels today, word-of-mouth reputation can make or break a business. If a caravanserai earned a bad reputation due to theft or other corrupt business, news could spread quickly through the oasis network.

Development of Phoenician and Greek Trade Networks in the Mediterranean

By 1000 BCE the Phoenicians were expanding their trade network across the Mediterranean, opening the way for the classical Greeks who then spread their own network. Plying routes from the land now known as Lebanon in the east to the Atlantic side of Spain and Morocco in the west, the Phoenicians carried basic goods needed by people in Egypt, Anatolia, and the Aegean who were still recovering from the destruction caused by the Sea Peoples (ca. 1200 BCE). Their cargoes included tin and copper, which craftsmen forged into bronze farm implements and weapons. Foodstuffs and clothing were also delivered to these subsistence societies, including olive oil and wine. These Phoenician merchants also brought with them high-end luxury goods and jewelry, and the artistic styles of these goods influenced art in Europe.

Since these latter goods were produced in excellent quality and quantity on the islands and mainlands around the Aegean Sea, an increased trade in olives and grapes began to pull these Greek communities out of the Dark Age into which they had fallen after the collapse of the bright Mycenaean society. With increasing trade in the agoras and the proliferation of luxury

Relief of a Phoenician trading ship, known as the Ship of Tarsus, carved into a Phoenician sarcophagus. (Gianni Dagli Orti/Corbis)

➤ SILVER PRIZED IN ANTIQUITY

Even before silver became a medium for exchange, it was used for luxury goods that were widely traded. At Troy, the great Achilles gave the winner of a footrace an exceptional Phoenician silver bowl. It was made in Sidon and exceeded all others in the world for beauty, as told in Homer's *Iliad* (23:740–749), which was written around the eighth century BCE.

—Sanford Holst

items, thriving Greek city-states, or *poleis*, began to form, and the light of learning flickered to life again. With this growing prosperity, the mining of gold and silver became more advantageous, not only for its beauty and use in luxury items but also as a valuable medium of exchange in conducting the increasing business of trade.

As the bustling Greek trading ships began serving all ports in the Aegean, the Phoenicians became marginalized in that region, serving only the long-haul connections outward bound to Sicily and points west or to distant Egypt and lands in the East. Beginning in 734 BCE, however, when Greek colonists set foot on Sicily, Greek trading ships began to push farther west and south, causing the picture of trade networks to become much more complex. Some ports belonged to a specific network, while others—when wars were not raging—might be visited by Greek as well as Phoenician ships.

From their major city of Carthage on the coast of North Africa, the Phoenicians controlled trade in the Mediterranean west of Sardinia. Gold and silver from the Rio Tinto region of Spain were important trade goods on these lines, as were spices from Morocco as well as traditional foodstuffs, cloth, and raw materials. The exception to their dominance was a collection of Greek trade emporia established at Marseilles and environs.

To the east, the trade activity was much more open. In Egypt, for example, the Phoenicians used their earlier arrival to establish their district in Memphis, the major city located near where Cairo stands today. So the Greeks simply developed the city of Naucratis in the Nile Delta and took on a strong presence.

With these two major sea-trade networks serving the Mediterranean, Aegean, and Black seas, many cities were able to grow, populations increased, and trade thrived. When Alexander the Great conquered the Phoenicians in Lebanon, the eastern Mediterranean essentially became a Greek sea. Then, when Rome defeated Carthage and extended its hold over Greece, the entire Mediterranean became a Roman sea.

Monsoon Travel on the Indian Ocean

In the ancient world, the Indian Ocean was the only open sea regularly traversed by Eurasian navigators. The wind systems of the Atlantic pinned Europeans and Africans to their coasts, and the people of East and Southeast Asia did not venture into the Pacific. What allowed and encouraged the use of the Indian Ocean were the monsoon winds that blow across the northern Indian Ocean and the waters of Southeast and East Asia.

The term “monsoon” comes from the Arabic *mawsim*, meaning “season.” The blustery southwest monsoon prevails in summer, and the milder northeast monsoon blows in winter. In simplest terms, the monsoons are determined by the relative temperatures of the Asian landmass and the Indian Ocean. In winter, when the

land is colder than the water, warm air rising over the Indian Ocean draws the northeast monsoon winds from China and Japan toward the Strait of Malacca and from South Asia toward Africa. In summer, when the Asian landmass warms, the southwest monsoon blows from Africa toward India and Southeast Asia and from the Strait of Malacca toward China and Japan. The southern limit of the monsoon winds is about 10°S, near the Tanzania-Mozambique border in Africa, below which blow the trade winds. Winds are variable between the equator and 5°N and north of 20°N.

The winds of the northeast monsoon (December to March) rarely exceed 11–16 knots in the Indian Ocean, but the southwest monsoon averages 22–27 knots in June and September and a strong 28–33 knots in July and August. This made navigation along India’s long exposed west coast very dangerous.

It is difficult and sometimes impossible to make progress against an oncoming wind. However, sailors were reluctant to sail into the unknown with a following wind for the simple reason that if the wind never or rarely reverses direction, it may be impossible to return to one’s point of origin. Because the direction of

➤ EUDOXUS OF CYZICUS

Eudoxus of Cyzicus was probably the captain chosen to lead the voyage from Egypt to India with the shipwrecked Indian sailor in 120 BCE. He is said to have returned with perfumes and precious stones only to have them confiscated by the king. Eudoxus led a second expedition, “But on his return voyage,” according to the first-century Greek historian Strabo, “he was driven south of his course by the winds to the south of Ethiopia, and being driven to certain places he conciliated the people by sharing with them bread, wine, and dried figs (for they had no share of such things), and in return therefore he received a supply of fresh water and the guidance of pilots, and he also made a list of some of their words.” If on this voyage Eudoxus sailed from India on the northeast monsoon and without an experienced pilot, he could easily have been driven south of his destina-

tion. The fact that he could hire pilots on the African coast shows that he was still within the orbit of an active maritime trading world. He returned home with a piece of flotsam that sailors in Alexandria told him was the stem post of a vessel unique to Carthaginian Spain. Concluding that Carthaginians must have circumnavigated Africa from west to east, he fitted out an expedition to do the same. Frustrated by contrary winds in the Atlantic, he returned to Spain. His second expedition, around 100 BCE, sailed into oblivion.

Bibliography

Strabo. *The Geography of Strabo*. 8 vols. Translated by Horace Leonard Jones and J. R. Sirlington Sterrett, London: Heinemann, 1917–1932.

the monsoon winds reverses seasonally, Indian sailors, for example, could sail to Africa or Arabia with the northeast monsoon in the winter, confident that they could return home on the southwest monsoon in the summer. Until the coming of steamships in the nineteenth century, virtually all shipping on the Indian Ocean and in the South China Sea was dictated by the monsoons.

When sailors began to entrust themselves to the monsoons for long-distance voyages is unknown, but maritime commerce on the Indian Ocean is of great antiquity. The earliest record of trade that was likely dictated by the monsoons was that between Mesopotamia and the Indus Valley, via the Persian Gulf and Arabian Sea, in the third millennium BCE. The Achaemenid Persian emperor Darius attempted to open trade between the Persian Gulf and the Red Sea, which suggests that the monsoons were known, if not fully exploited, in the late sixth century BCE. When Alexander the Great turned back from the Indus River two centuries later, he sent part of his army by sea under command of Nearchus. According to the historian Arrian, after building a fleet near modern Hyderabad, Pakistan, Nearchus had to wait until “the seasonal winds had sunk to rest, which continue blowing from the Ocean on to the land all the summer season, thus making it impossible to sail.”

The second century BCE represents a watershed in the development of Indian Ocean trade. One theory holds that this is when sailors from Ptolemaic Egypt discovered the seasonal nature of the monsoon winds, although Nearchus had remarked on these a century before. Whatever the reason, direct trade between Egypt and India seems to have begun after 120 BCE, when a shipwrecked Indian merchant was rescued on the Red Sea and brought to Alexandria where, restored to health, as Strabo (64 BCE–23 CE) chronicled “he promised to act as guide on the trip to India for the men who had been previously selected by the king.”

From this period, there was more or less regular traffic between the Indian Ocean and the Mediterranean via Egypt. Although the written record of Mediterranean and later European authors provides the greatest detail about this commerce, Asian merchants probably profited more

from the monsoon trade, which sent spices and silks west in exchange for bullion. The balance of trade began to turn only in the eighteenth century CE, 100 years before the steamship enabled seafarers to all but ignore the monsoons that had set the rhythm of trade for millennia.

Ancient Aksum—An Ethiopian Trade Kingdom

The Ethiopian city of Aksum (also Axum) was once the capital of an African trading empire that took advantage of its strategic position near the trade routes of the Red Sea. Roman, Persian, and Indian merchants traded goods along this route, which itself connected (in India) to the Silk Roads. Goods from Africa, the Mediterranean, and Asia all passed through Aksum's harbors, making it an extremely cosmopolitan center. The trade route is mentioned in the ancient Greek *Periplus of the Erythraean Sea* (a periplus was a type of ancient text that listed ports in the order in which they were located on a route).

Aksum itself was located inland, but it controlled two major harbors: Adulis and Avalites. These two harbors were connected to a series of African inland trading routes that brought goods from northwestern Africa to Aksum that were sold for the exotic goods of the Romans, Indians, and Persians. Aksum's own resources were diverse. Gold and iron deposits, agricultural products (especially wheat and barley), animal products (such as ivory and rhinoceros horn), and slaves were all goods that the Aksumites sold to Red Sea traders.

The origins of Aksumite culture are somewhat obscure. Scholars used to argue that these were the descendants of Sabaean (southern Arabian) immigrants. More recently, scholars have suggested that the Aksumite kingdom was an indigenous development and that the Semitic language spoken in the kingdom was spoken in Africa long before Sabaean. Ge'ez, the language of Ethiopia, was spoken there from at least 2000 BCE and possibly earlier. Ge'ez was the main language of the Aksumites (for which they developed their own alphabet), and it is still used in liturgical contexts in the Ethiopian Christian Church today. Around 324 CE, Christianity is adopted by the Aksumite Kingdom. Prior to that, the religion of the Aksumites seems to have been a mixture of southern Arabian and Egyptian deities; most of what is known has been reconstructed from epigraphic sources (especially personal names that mention various deities) and iconography found on artifacts.

During the first century CE, the city of Aksum became a major power in the Horn of Africa; its imperial expansion was fueled by profits from the recently developed Red Sea routes, routes made possible through innovations in the

use of monsoons for sailing in the Indian Ocean. At its height, the empire of Aksum encompassed northern Ethiopia, northern Sudan, and Eritrea in Africa. At some points, it also wielded influence over what is now known as Yemen on the Arabian Peninsula.

—Kevin M. McGeough

➤ THE ARCHAEOLOGY OF AKSUM

Much of the archaeological work at the city of Aksum has concentrated on the elite residences and elite graves associated with the city. Many of the larger structures were constructed on stone bases, and the buildings would have been entered through monumental staircases. Most noteworthy of Aksumite material culture are the monumental stelae that were presumably used as grave markers for elites. The largest of these is over 108 feet (33 meters) in height. It has been suggested that they represent many-storied buildings, as various inscribed drawings of architectural features can be discerned on some of them.

The Promotion of Trade through Buddhist Sanghas

Since at least the first century CE, Buddhism has been an important vector of Asian trade. Reliant as they were on alms for funding their sanghas, or temples, Buddhists were sympathetic to merchants with whom many Buddhist missionaries traveled from India through the Hindu Kush and Karakoram mountains into central Asia and

China and across the Bay of Bengal to Southeast Asia and China. The intimate relationship between Buddhism and trade is seen in the *Jatakas*, stories about the Buddha's past lives as a Bodhisattva (enlightened being). A number of these tell of the Bodhisattva as a merchant traveling to Southeast Asia for jewels, herbs and spices, aromatic woods, and other rarities.

Buddhist monks were particularly well known for their study of the medicinal use of herbs, ointments, plants, and other items. This knowledge was collated in pharmacopoeias (treatises on drugs and their uses) that were highly sought after as were the medicinals prescribed, many of which came from tropical areas. Traffic in these goods, together with religious texts and paintings, proved a major stimulant to trade in the early centuries of the Common Era, especially between India and Southeast Asia to the south and central Asia and China in the north. Relics of the Buddha were another popular item of exchange, and among the first so traded was a branch of the bodhi tree under which the Buddha achieved enlightenment in northern India. The tree was trans-

► BUDDHIST BOOKS OF DISCIPLINE

Between 399 and 414 CE, the Chinese Buddhist Faxian traveled from China to India “in Search of the Buddhist Books of Discipline.” In crossing the deserts of the Tarim basin of western China and the mountains of Tibet, Pakistan, and India, he followed a route carved out—sometimes literally—by generations of intrepid traders. In the following extract, Faxian offers a vivid account of the terrifying track that all travelers, whether monk or merchant, had to traverse along the upper reaches of the Indus River in Jammu and Kashmir, the northernmost state in India.

“The travellers went on to the south-west for fifteen days (at the foot of the mountains, and) following the course of their range. The way was difficult and rugged, (running along) a bank exceedingly precipitous, which rose up there, a hill-like wall of rock, 10,000 cubits from the base. When one approaches the edge of it, his eyes become unsteady; and if he wished to go forward

in the same direction, there was no place on which he could place his foot; and beneath were the waters of the river called the Indus. In former times men had chiseled paths along the rocks, and distributed ladders on the face of them, to the number altogether of 700, at the bottom of which there was a suspension bridge of ropes, by which the river was crossed, its banks being there eighty paces apart.”

Faxian returned to China by ship across the Bay of Bengal and the South China Sea.

Bibliography

- Fa-hien [Faxian]. *The Travels of Fâ-hien: A Record of Buddhistic Kingdoms, Being an Account by the Chinese Monk Fâ-hien of His Travels in India and Ceylon (A.D. 399–414) in Search of the Buddhist Books of Discipline*. Translated by James Legge. 1886; reprint, New Delhi: Master Publishers, 1981.

planted at Anuradhapura, Sri Lanka, in the third century BCE.

Buddhism reached China from the west via the Silk Roads in about the first century CE. Its further growth there was fostered by the opening of a direct sea route from the Strait of Malacca across the South China Sea, and indeed the oldest account we have of such a trip is from a Buddhist monk named Faxian who made the passage in about 413 CE. Shortly before this time, Buddhism had taken on the aspect of a state religion in northern China, and this state Buddhism, which justified rulers in their power, was emulated by the Korean kingdoms of Koguryo, Silla, and Baekche and in the sixth century by the Yamato kingdom in Japan. Relations between Korea and Japan were long-standing, and the Japanese relied on Baekche as a source of iron. But the most conspicuous of the Korean kingdom's exports was the gift, in 538 CE, of Buddhist texts. Buddhism thereafter became a major religious and philosophical force in Japan. The terms by which Japanese Buddhism was augmented are sometimes curious. In response to an appeal from Baekche for help in their war against Koguryo in 544 CE, for instance, the Japanese agreed to send men, horses, and ships in exchange for hostages including a prince, a Confucian scholar, and a Buddhist priest.

It is not always possible to distinguish between sacred and secular trade goods, but the identification of certain exotic plants and animals with Buddhist imagery made them particularly attractive. Peacocks and *kalavinka* birds were the subject of dances that told stories based on Buddhist texts, and dancers, musicians, and their instruments as well as birds made their way to China from India and Southeast Asia, often as official gifts. The *kalavinka* originated in India and spread from there to southern Vietnam, China, and, in the ninth century, Japan, where the dance is still performed. Plants and incense woods were also popular as adornments to temples, as medicinals, and for perfuming homes.

Most notable of the material goods traded between various centers of Buddhism were copies of the sutras and other religious texts. Originals were frequently sought from India, especially in China, while the kingdom of Silla sent a collec-

tion of sutras to the emperor of China in the ninth century. Buddhists are credited with introducing the art of writing from India to Southeast Asia, but they also carried intangible musical, painting, and calligraphic styles from India to central Asia and China. Such transplantation was vital to the survival of Buddhism, which remains strongest in Sri Lanka, Southeast Asia, China, Korea, and Japan centuries after its disappearance from central Asia and India.

Merchants and Trade in Qin and Han China

In early imperial China, merchants embodied a contradiction. On the one hand, many people engaged in commercial activities, and wealthy merchants commanded respect and influence. On the other hand, deeply suspicious of their wealth, the state sought to control and repress them. Hence, even though both internal and external trade flourished, the government never viewed commercial activity positively.

Trade flourished in early imperial China as never before. A number of factors were responsible for this situation: the Qin dynasty's creation of an extensive infrastructure in roads and canals; its unification of weights, measures, and currency; and the Han dynasty's peace and stability. As the great historian Sima Qian (ca. 145 or 135 BCE–86 BCE) tells us, "After the Han rose to power, the barriers and bridges were opened and the restrictions on the use of the resources of the mountains and lakes were relaxed. As a result, the rich traders and great merchants traveled all around the empire distributing their wares to every corner so that everyone could

► "THE GATE OF THE EASTERN MARKET"

This is a second-century CE rubbing of an impressed brick from Sichuan. On the left side, there is the gate. Written above it are the words, "The gate of the Eastern Market." On the right-hand side there is the tower, with a drum on the second story that was struck to signal the market's opening and closing. From this tower, officials also kept watch of market dealings. On the lower left, there is a man selling cooked food.

buy what he wanted." Indicative of trade's profitability, Sima Qian tells us that commoners could expect a 20 percent annual profit on any investment; consequently, "If a man is trying to work his way up from poverty to riches, then farming is not as good as handicrafts, and handicrafts are not as good as trade." Those merchants who dealt in the commodities that were most in demand, such as iron, liquor, and salt, could amass huge fortunes. Wealthy traders commanded so much respect that Sima Qian devoted a whole chapter of his history to them. He described them as having wealth that rivaled the most privileged members of society: "A family with a thousand catties of gold may stand side by side with the lord of a city; the man with a hundred million cash may enjoy the pleasures of a king. Rich men such as these deserve to be called 'untitled nobility,' do they not?" A few of these mer-

chants translated their wealth into political influence: Lü Buwei (d. 235 CE) became chancellor of the Qin kingdom, and Sang Hongyang (152–80 BCE) was chief economic minister under Emperor Wu of the Han.

During the Han period (206 BCE–220 CE) external trade expanded to a phenomenal degree. When Han armies conquered the Tarim basin, China became connected to the famed Silk Roads, and the Han capital of Chang'an became the route's eastern terminus. China's greatest export was silk. Pastoral nomads from the north were so eager to trade their animals for Chinese silk, iron, and luxury goods that if the Chinese government denied them access to the frontier markets, they would make war on the Chinese. The so-called barbarian market in the city of Wuwei, in the Gansu Corridor, was so popular that it opened four times a day. Han China also had extensive overseas trade in the southern seas. Foreign merchants congregated in Hanoi (in present-day Vietnam) and Panyu (Canton or Guangzhou) to exchange pearls, ivory, slaves, glass, amber, ivory, and incense for Chinese goods.

Despite their wealth and influence, the governing class despised merchants. By the Warring States period (476–221 BCE), philosophers of all schools viewed them as parasites who produced nothing and earned their profits deceptively. During the Qin, merchants were viewed as so lowly that they, along with other despised groups such as convicts and marrying-in sons-in-laws, were banished to the frontier. The Han government forbade merchants from wearing silk, riding in chariots, carrying weapons, and becoming officials. Merchants also had to pay much heavier poll and property taxes than others. This disdain for commerce also caused authorities to closely regulate market activities. Urban trading had to take place in government-controlled walled markets. Officials decided which traders to let into the market and watched them from an observation tower located in the middle of the marketplace. Those who sold the same wares had to be in the same location. Goods had to have price tags, and contracts had to be drawn for large purchases. Rural markets were much less tightly supervised.

Despite the Qin and Han governments' efforts to discourage farmers from becoming mer-

► MOVEMENT OF MEN OF TALENT IN WARRING STATES CHINA

The Warring States period (453–221 BCE) in China saw an increase in travel for employment and patronage as opportunities increased for men outside the native aristocracy. Rulers and nobles supported talented men, both for the benefit of their service and for prestige. The best-known group was gathered by the king of Qi.

States were becoming larger, and warfare was becoming more intense during this time. Rulers were willing to do almost anything to gain advantages over other states. They also wanted to weaken aristocratic families at home. These factors led them to look for outsiders to employ. Talented men had a better chance of being noticed and employed. If they were not successful at home, they could try other states.

Not all travelers had talents that were directly beneficial to the state. There are stories of rulers who assembled swordsmen or men who made up logical puzzles. In some cases, rulers supported men with lodging and a stipend and did not require any service from them. However, most of the travelers were involved in diplomacy and statecraft,

and they had an important impact. Qin, the state that unified China, increased its power through employing men from other states as ministers.

The most famous group of talented men was in Qi. The Jixia group at times included many of the most significant thinkers of the day, including Mengzi (Mencius), Xunzi, and Zou Yan. It is sometimes known as the “Jixia academy,” but this is a misnomer. It was not a group of students gathered under one teacher, as in Plato’s Academy, nor was there a set curriculum as in the later Imperial Academy. The king supported them mainly for prestige, not for teaching.

chants, many peasants engaged in commercial activities. Farmers could sell either cash crops or goods they manufactured during the agricultural calendar’s slow periods. In fact, farmers might travel as far as 124 miles (200 kilometers) away to sell their goods. A humorous mock contract that describes the duties of a slave gives us some insight into the farmer’s commercial life: “He shall buy mats at Mianting, and when traveling between Du and Luo he should trade in small markets to get powder [money] for the ladies. When he returns to Du he shall carry hemp about on his pole, transporting it out to the side markets. He shall lead dogs [for sale], and peddle geese. At Wu-yang, he shall buy tea, and he shall carry lotus on his pole from the Yang family pool. . . . He shall make many knives and bows, and take them to Yizhou to barter for oxen and sheep.” Indicative of how interwoven commercial activities were with agricultural life, a second-century manual, the *Monthly Commands for the Four Classes of People*, instructs

estate owners to buy and sell goods during nine months of the year: one buys the staples in the season when they are cheap and sells them when they are much more expensive. This combination of agrarian and commercial enterprises led to the emergence of large landholding families that often dominated local politics. Liu Xiu, Emperor Guangwu (6 BCE–57 CE), established the Eastern Han dynasty with the aid of three such farmer-merchant families.

In sum, in both theory and law, early imperial governments loathed merchants and endeavored to discourage farmers from becoming them. Nevertheless, due to the unity and stability that the two governments established, trade flourished as never before, both within China and with other countries. Since commerce was so important and lucrative, many Chinese became merchants or engaged in mercantile activities. Some of the wealthiest of these merchants became men of great political influence.

Opening of the Arabian Sea

Trade between the Mediterranean region and India had been reliant on land routes for centuries. For this reason, goods such as spices passed through the hands of numerous middlemen, thus causing prices to soar. Three basic routes existed, all of which entailed some land route. The all-land route from the Levant to In-

dia was one, while sea travel through the Persian Gulf and land was the other. Finally, a route from the Mediterranean to the Red Sea and then through the Arabian Seas was used. Although for Mediterranean civilizations this may have seemed the most obvious route, it was actually more difficult simply due to the fact that the strong monsoon winds made it quite hazardous for inexperienced sailors. The need and desire for more affordable spices combined with military expeditions helped open the Arabian Sea as a viable route.

Not until sailors mastered the monsoon winds did the Arabian Sea become a practical route. Until this occurred, ships tended to hug the coastline or prefer to sail to ports and then rely on land caravan routes. For Indians and others used to the monsoons, the Arabian Sea was opened very early, as trade between India and East Africa existed for centuries. By using the monsoon winds, sailing across the Arabian Sea becomes relatively easy for at least four months of the year. The first recorded instance of Europeans, such as the Romans, realizing the importance of the monsoon winds appears in the first century CE. If any Mediterranean societies used the monsoon winds on a regular and recognized basis prior to this, it is unrecorded. Although Alexander the Great's fleet entered the Arabian Sea, it followed the coast in order to maintain contact with the Macedonian Army.

The key moment in the Arabian Sea trade, however, occurred in the first century BCE when sailors began to use the southwest monsoon

➤ RIDING THE MONSOON WINDS

The seasonal monsoon winds predicated the Arabian Sea trade. The term "monsoon" comes from Arabic and means "seasonal wind." Roughly from April to October, the winds blow from Africa in the southwest to the northeast due to the heat waves emanating from Africa and Arabia. Then in the winter, the winds reverse direction and blow from the northeast to the southwest. These seasonal winds not only cut down travel time but also dictated trade cycles. Thus, certain objects

would typically appear in markets at certain times of the year. For instance, Roman merchants would sail to India in the summer and then could return to their homes in the winter. Although such climatic conditions cut travel times significantly, the journey could still be fraught with peril, as in June and July when tropical storms made it particularly dangerous for small ships to leave port.

—Timothy May

ARABIAN SEA AND ROUTE NORTH TO CENTRAL ASIA

winds to sail from ports in the Gulf of Aden to India. By the time of the Roman empire, Roman merchant colonies began to appear in India and along the Arabian Peninsula. These tended to be populations that had always been involved in the trade across the Arabian Sea such as Greeks, Egyptians, and Arabs but whose motherlands were now part of the Roman empire. Indeed, it was the expansion of trade through the Red Sea to the Arabian Sea that was driven primarily by Roman demand for silks and spices. During the Hellenistic age, the Arabian Sea route was largely neglected. Once Rome extended its control over Syria and Egypt, the Roman elites developed a taste for Eastern luxuries.

The opening of the Arabian Sea had a tremendous impact on ancient trade routes. Water routes have always been more affordable for the simple fact that a boat can carry significantly more goods than any animal. Although trade between India and Africa thrived for centuries, with the opening of the Red Sea in the first centuries BCE and CE, Eastern luxury items such as silks and spices entered the Mediterranean region in unprecedented numbers. Indeed, Romans reported that in addition to spices such as cinnamon and pepper, the Indian ports were filled with multicolored textiles, tin, diamonds, sapphires, pearls, and Chinese silk, not to mention numerous foreign merchants. Even though wars between the Roman empire and the Parthian empire disrupted the overland routes known as the Silk Roads, it had relatively little impact on the sea routes. While Roman influence had little impact on India, other facets of Mediterranean culture and society entered regions between the Mediterranean and Arabian Sea, including the spread of Christianity into Aksum (present-day Ethiopia) in the fourth century CE. Aksum also derived architectural forms from Syrian, Roman, and Indian styles.

Spice-Trade Kingdoms of Yemen

Southern Arabia is the home of a number of plant species that are used in the production of aromatic oils and spices (such as frankincense and myrrh). Demand for these spices by the Romans, Parthians, and Kushans led to the formation of very wealthy kingdoms in what is now known as Yemen. Over the course of the period from 1000 BCE to 300 CE, numerous small polities in Yemen competed and colluded in providing Eurasia and Africa with these valuable spices.

The people of ancient Yemen spoke Old South Arabian, which they wrote using the Old South Arabian script, and much of our historical evidence for the Yemeni kingdoms comes from inscriptions. These inscriptions have been particularly important in helping scholars reconstruct the religions of the region. Generally, the religions of Old South Arabia emphasized solar, lunar, and stellar deities, some of whom were related to deities known from the Levant (such as Athtar).

The largest (and best understood) of the Yemeni kingdoms was the kingdom of Saba, which some have suggested was the Sheba of the Hebrew Bible. The Sabaeans were located in southwestern Yemen, with their capital city being Marib, near the modern city of Sana'a. The Sabaeans were farmers, a subsistence practice made possible in southern Arabia through intensive irrigation schemes involving massive earthworks. The most notable of these irrigation projects was the Marib Dam, which was located upstream from Marib on the Wadia Adhanah. Construction on this massive dam began around 750 BCE. It consisted primarily of packed earth attached to two groups of stone outcroppings located on each side of the river.

Other kingdoms that participated in the spice trade throughout the period from 1000 BCE to 300 CE were the Qataban, Ma'in (the Minaeans), and Ausan (or Awsan) kingdoms, all located within southern Arabia. The kingdom of Himyar also played a role in the spice trade but first arose around 100 CE, later than the other Yemeni kingdoms. The relationships among these kingdoms vacillated between commercial partnerships and outright warfare. Most of these conflicts stemmed from attempts to control various elements of the

➤ FRANKINCENSE AND MYRRH

Frankincense and myrrh were the two foundations of the southern Arabian spice trade in antiquity and were highly prized by the Romans and by the peoples of South Asia. Frankincense is an aromatic oil made from the milky sap of the *Boswellia* tree. When burned, it gives off a sweet smell. Myrrh is similar in that it is also derived from tree sap, but many trees produce sap that can be classified as myrrh. Those trees are generally found in Yemen, Somalia, Ethiopia, and Jordan, all

regions that may have been connected during the period from 1000 BCE to 300 CE by spice routes. Myrrh was especially valuable as a constituent element in a variety of perfumes. Roman demand for myrrh was especially high because it was used to mask the smells of bodies being cremated, and thus Roman funerary practices can be seen as one of the driving forces of the southern Arabian spice trade.

—Kevin M. McGeough

spice trade. The military conflicts within Old South Arabian society are evidenced by the fortifications that surrounded the major urban centers. The earliest city walls were constructed of large boulders; later fortifications were constructed of cut ashlar masonry, a sign of the growing wealth of the cities. Generally, the Arabian Desert acted as a natural boundary against outside invaders, and the fortifications can be safely presumed to reflect warfare between the kingdoms. However, under Augustus, the Romans attempted to conquer this region (what they referred to as *Arabia Felix*), an invasion that was unsuccessful.

The spice trade was the source of much wealth for these kingdoms. Among later Arabic-speaking communities, the word “Marib” evoked images of wealth beyond reckoning, and no doubt this reflects the historical situation to some extent. Spices and aromatics were exported to the Mediterranean, Persia, India, and Africa from their production center in southern Arabia. Imported Roman, Parthian, and Nabataean pottery found at Old South Arabian sites demonstrates direct trade connections with these cultures. Old South Arabian traders had a monopoly on frankincense, but myrrh and other products were also shipped from this region by camel through the Arabian Desert or by the Red Sea trade routes to India. Scholars used to believe that the rise of the Red Sea maritime trade routes undermined the use of overland camel routes. Recent archaeological excavations, however, have demonstrated that both trade routes flourished throughout the first centuries of the Common Era.

The Nabataeans

The Nabataeans were a nomadic people who controlled the territory and the trade routes of what is today known as Jordan and northern Arabia from at least 312 BCE until their conquest by the Romans in 106 CE. Their exact origins are unknown, but it is likely that they moved into this region from northeastern Arabia as a northern Arabian trade route between Egypt and Babylonia developed. Through controlling a major node along the northern and southern Arabian trade routes, the Nabataeans became very wealthy in a relatively short span of time.

The development of the Nabataean kingdom is an interesting example of the manifestation of Hellenistic society in the Near East. The political culture first appears as a fully Hellenized kingdom, with the Nabataean kings utilizing

THE AL KHAZNEH AT PETRA

One of the most awe-inspiring moments for visitors to Petra in Jordan is when, after passing through a narrow and twisting canyon wall, they get their first glimpse of the Al Khazneh (“The Treasury”), a building with an elaborate facade carved directly into the sandstone of the canyon wall. The facade reflects a striking Hellenistic influence, incorporating the pediments, tholos, and Corinthian columns that one expects to find in Greece. Yet visitors are often disappointed when they enter the building and realize that its name is misleading and that it was not a treasury at all (a name given it because of local legend). Rather, it was the monumental tomb (now emptied) of an ancient Nabataean leader. The “Treasury” is not the only tomb facade found at Petra, and the prominence of tomb facades at the site reflects an interesting fusion of Hellenistic aesthetics within Nabataean society.

—Kevin M. McGeough

Hellenistic titulary and models of governance and organizing their army along Hellenistic lines. The material culture and architecture of the Nabataeans was heavily influenced by Hellenistic aesthetics: buildings are designed according to Greek architectural concepts, towns are planned according to Greek principles, and material culture such as coinage (with Hellenistic themes) is common.

The capital of the Nabataean kingdom was Petra, in modern-day Jordan. The kings who ruled from Petra likely ruled a relatively decentralized kingdom, which is perhaps better thought of as a political alliance of diverse groups spread throughout the Nabataean territory. Petra’s strategic location at the center of the Arabian trade routes and its fortresslike natural caverns made this a logical location for a desert community and regional power base. The hydrological skills of the Nabataeans allowed them to take advantage of Petra’s natural water resources (a perennial spring) and create a lush community in the rose-red cliffs. These hydrological skills allowed the Nabataeans to engage in agriculture, which allowed the community to

survive after the decline of the overland trade routes.

Nabataean inscriptions have been found in the Sinai and Egyptian deserts, suggesting that there was a Nabataean presence beyond Jordan along the northern Arabian trade route. This trade route that linked Egypt with Babylon was only one of the routes that Petra was located along. The southern Arabian trade of aromatic oils and spices from the Far East continued through Jordan to the Levantine coast. This was one of the major routes that linked Arabia with Roman and Mediterranean culture, and both Strabo and Josephus provide accounts of these people and their relations with the communities of the Mediterranean. The Nabataeans were also known by the Han court in China; the city of Petra was called Li-kan in Chinese.

North and South Routes of the Taklamakan

Traveling from the Chinese capital of Chang’an (Xian) toward the west, the merchants eventually reached the town of Anxi where the route diverged, skirting the northern and southern rims of the 204,634-square mile (530,000-square kilometer) Tarim basin. The basin, surrounded by mountains on both sides, contains the huge Taklamakan Desert, “the place from which no living thing returns alive.” At Anxi, merchants traveling west traded their horses and mules for Bactrian camels, which were better able to tra-

THE BACTRIAN CAMEL

The Bactrian camel (*Camelus bactrianus*) is indigenous to central Asia. It is distinct from its Arabian cousin, having two humps. In the winter, the Bactrian camel grows a long shaggy coat to help protect it from the bitter cold weather. From central Asia the Bactrian camel spread both east and west. The animal appears in Persian art and Greek vases as early as the fifth century BCE but was unknown in central China until the fourth century BCE. With the opening of the trade routes through central Asia, the Chinese became familiar with the camel, and it was used as a pack animal for the route around the Taklamakan Desert.

Bactrian camels in the Gobi Desert, Mongolia. (Midkhat Izmaylov)

verse the hostile, arid route to Kashgar on the other side of the basin.

The northern route was known as Tianshan Bei Lu, or the “road north of the Celestial Mountains.” Leaving Anxi, travelers endured a two-week journey across the Black Gobi with its dry climate and frequent sandstorms, finally reaching Hami, the first of the oasis towns. Water was brought from the Tianshan Mountains to Hami and other northern oasis towns through underground canals called *kariz*. From Hami the route crossed the southern foothills of the Tianshan Mountains to Turfan, the second-lowest place on earth at 492 feet (150 meters) below sea level. It was known for its oppressive heat and lack of rain. Cities along the northern route engaged in agriculture like Hami but also exploited the mineral deposits in the surrounding mountains, which became import trade items. Copper, lead, iron, gold, orpiment (a yellow oxide of lead used in cosmetics by the Chinese), and sal ammoniac (used in leather making) were mined and traded along with many other minerals.

Leaving Turfan, travelers continued their journey westward and passed through Jiaohe (Yarkhoto), Toksan, Karashahr, and Kuqa (Kucha, Qiuci). In the second century CE Kucha had a population of 150,000 and was another crossroads. From Kucha you could travel northward and cross the Tianshan Mountains and turn southward and cross the desert to Khotan or turn southeast to Dunhuang. If you continued westward you passed through Aksu, finally arriving at Kashgar, 2,299 miles (3700 kilometers) from Chang’an.

The Southern Silk Road was called Nan Shan Bei Lu, or the “road north of the Southern Mountains.” It was shorter and somewhat safer than the Northern Route with fewer brigands, but it was also more difficult to travel on. There were fewer oases and towns, and they were farther apart. Leaving Anxi, the traveler passed through Dunhuang with its Buddhist caves and traveled through the Yangguan pass to Loulan. This region had a very strong Chinese influence from at least the second century BCE. Loulan, Niya, and

other cities near Lake Lop Nor were abandoned in the third and fourth centuries as the rivers dried up, leaving them without a source of water. The main road then shifted to the south. Farther on was Khotan, founded in the third century BCE and known for its jade. It was also the first oasis kingdom along the Tarim basin to embrace Buddhism. Continuing, a traveler passed through Yarkand and finally to Kashgar. In Kashgar, west-bound merchants either traded their goods and returned home or traded their camels for mules and horses and continued on their way. Merchants traveling east exchanged their carts for the hardy Bactrian camels for the dry and dusty trip to Anxi.

Development of River-Based Trade in Celtic and Roman Europe

Later prehistory (ca. fifteenth century BCE to first century CE) in central and western Europe and the history of the Roman period (ca. second century BCE to fifth century CE) was characterised by increasingly wide-ranging intercultural contacts. These contacts led to a growing similarity in material culture across much of Celtic and Roman Europe. From the available evidence, it is quite clear that trade played a significant role in this process. European waterways facilitated large-scale trade and brought peoples into closer contact with one another.

Diodorus of Sicily (5.26), states that "many Italian merchants see Gaul as the opportunity for quick riches. These traders bring the wine by boat on the rivers and by wagon through the plains." The distribution of archaeological evidence of imported goods, particularly imports from the Mediterranean—often associated with wine in later prehistory—broadly confirms this statement. Starting out with the earliest southern imports, wine amphorae from Massalia (Marseilles), and wine-drinking cups from Athens, the distribution patterns reveal clustering along the main rivers, at first mostly along the Rhone, the Rhine, and the upper Danube. The same general pattern is later found in the distribution of wine amphorae of the late second and first centuries BCE. The importance of the river-based trade is further illustrated by the finds of port facilities (e.g., in Geneva) and a relatively dense network of bridges and roads, connecting the rivers to the surrounding countryside, as evident from numerous archaeological finds from Switzerland, which was one of the main late prehistoric routes connecting the Rhone with the Rhine.

However, while the southern imports help to illustrate the river-based trade networks that crisscrossed later prehistoric Europe, it would be wrong to assume that they were the main driving force in its evolution. Rather, much of this trade network must have developed locally to transport various kinds of unevenly distributed raw materials such as copper, tin, and salt across much of central and western Europe. For instance, the massive exploitation of inland salt sources—both salt springs and the alpine salt mines—seems to have taken off in the late Bronze Age, with the main distribution of the central and western European Hallstatt culture closely corresponding to the likely distribution zones of inland salt. Similarly, large amounts of tin had to be transported across much of Europe throughout the Bronze Age, with river-based transport being the most likely vehicle for trade in this valuable resource.

With the increasing importance and even wider distribution of mass-produced generic goods during much of the Roman period in temperate Europe, the significance of river-

based trade grew even greater. Even though many Roman roads were reasonably well built and maintained, large amounts of any kind of goods were still much more easily and efficiently transported along the navigable rivers. As a consequence, most of the major urban centers of Roman Europe are located conveniently along the main waterways.

Adena and Hopewell Exchange

The Adena and Hopewell trade networks of eastern North America developed from earlier Late Archaic period patterns of exchange. The movement of Great Lakes copper, marine shell, and various cherts are three important materials that show some continuity from the Late Archaic through the Hopewell period. Another important component of these Late Archaic, Adena, and Hopewell practices is that the nonlocal objects were deposited (at least eventually) in caches or with burials. Adena and Hopewell communities often covered these burials and ritual caches with mounds.

TRADE NETWORKS OF THE ADENA AND HOPEWELL

Early Adena societies emerged in the central Ohio River valley around 500 BCE and developed in southern Ohio into Hopewell communities around 50 BCE. However, Late Adena communities in West Virginia and Kentucky overlap in age with the Hopewell societies of southern Ohio. Lake Superior copper, mica, tubular pipes, steatite (soapstone), and various cherts are some of the nonlocal materials that were acquired by Adena communities. Some Late Adena iconographic styles also appear in the lower St. Lawrence drainage and the Delmarva Peninsula.

The beginning of the Hopewell Horizon is often based on the presence of particular ceramic designs that first appear in the Lower and central Mississippi River valleys as well as the Illinois River valley. Southern Ohio peoples incorporated these influences into their pottery around 50 BCE, and the Hopewell period continues to about 400 CE. Ideas, materials, and finished objects moved widely throughout eastern North America during this period. Characteristic iconographic motifs include raptorial birds and spoonbill ducks depicted on a variety of material media, such as pots, copper plates, and engraved into bone. Hopewell peoples procured a number of important raw materials, which were often crafted into exquisite ceremonial objects, include Lake Superior copper, mica, marine shells, channel coal, pearls, exotic chert, obsidian, galena, meteoric iron, silver, and a small quantity of gold. However, not all the communities of eastern North America participated in these interregional exchange networks, and there is a marked spatial discontinuity to the distribution of many nonlocal objects.

Ohio Hopewell communities appear to have differentially acquired a wide variety of nonlocal materials and ceremonial objects, including animal effigy pipes, that were sometimes deposited in ritual caches. One important example is the 300 pounds (136 kilograms) of obsidian interred under Hopewell Mound 11, located northwest of Chillicothe, Ohio, which appears to have been directly procured from Yellowstone National Park. The direct acquisition of this obsidian is also supported by depiction of big horn rams in Hopewell iconography. Big horn rams are not local to east-

➤ ANIMAL EFFIGY PIPES

Large caches of exquisitely carved Hopewell animal effigy platform pipes were deposited in fired clay basins under Mound 8 at Mound City and the Tremper mound. Smaller quantities of animal effigy platform pipes also occur with burials at various Hopewell mounds. These animal effigy pipes depict in a naturalistic style a veritable menagerie of different mammals, reptiles, and birds, although some stylized motifs occur. While archaeologists believed that most of these pipes were made of Ohio pipestone, recent mineralogical analyses suggest a variety of different pipestone sources from different areas in eastern North America.

—Bretton Giles

ern North America but instead live in the western United States near the obsidian sources indicated by recent chemical analyses. Despite early suggestions that most of these nonlocal objects moved down the line exchange, many nonlocal objects in addition to obsidian may have been directly acquired from distant sources, including meteoric iron and some copper. It is becoming increasingly clear that these objects, materials, and ideas moved through the Hopewell interaction sphere by means of a variety of different cultural mechanisms, including through ritual pilgrimages, the purchase of ritual prerogatives, direct acquisition, and gift exchange.

—Bretton Giles

■ Introduction: Modes of Transportation

For the most part, transportation technology in the period from 1000 BCE to 300 CE remained relatively similar to the technologies available prior to this time. Shipbuilding technology altered to some degree, but the fundamental components remained the same. The most intensive use of seafaring vessels was by the cultures bordering the Mediterranean Sea—the Greeks, Persians, Phoenicians, and Romans—who developed substantial navies and shipping fleets.

Land transportation continued much as it had prior to this period as well, although horse-based travel became more prominent in northern Europe and central West Asia than it had been in previous periods. Roman road construction is near legendary; these roads allowed chariots and animal-drawn carts to be used as favored sources of transportation. In other parts of the world it is unclear whether or not chariots and carts were used to travel substantial distances. Certainly use of these vehicles within towns would have been common, but between villages it is less likely. Thus, despite the fact that Chinese chariots and carts have been discovered dating to this time, it is most likely that the Chinese (and other cultures in East and South Asia) trav-

eled predominantly by horseback, given the lack of paved roads. In Mesoamerica, the jungle and marsh terrain and the lack of beasts of burden meant that wheeled vehicles never gained the prominence that they did in other societies. Most traffic in that region was on foot or by water.

Arguably the most dramatic change in this period is the widespread use of the camel. While the camel had been domesticated in earlier periods, its use for transportation seems to have been limited to Mongolia and Arabia. By 1000 BCE the use of the camel had become more widespread, allowing desert regions to be traversed with large quantities of supplies and trading wares.

—Kevin M. McGeough

The Domestication of Camels and the Opening of the Deserts

Despite the importance of the camel to desert dwelling communities, both the *Camelus dromedaries*, or one-humped camel, and the *Camelus bactrianus*, or two-humped camel, were domesticated relatively late. Nonetheless, the camel played a central role in the economic development of ancient Asia, especially in opening trade and travel routes through the desert, whether

➤ CAMELS AND THE ENVIRONMENT

Whether dromedary or Bactrian, the camel is a perfect example of an animal evolving to meet the challenges of its environment. Its nostrils are able to close and shut out wind-blown sands. Long eyelashes serve a similar function for the eyes. The feet of both camels are tough and heavily padded, allowing the animal to endure the hot desert sand as well as sharp and irregularly shaped rocks. Furthermore, it can survive on many plants from which other domesticated animals cannot derive any nutrition.

The most noticeable feature of either camel is its hump(s). The hump is a mass of fat and serves as a reservoir of calories, which provide the

camel energy when it cannot graze. Thus, when the camel is fed regularly and well the hump will stand erect, as the fat reserve is not used. As the camel begins to burn calories from the hump fat, it gradually becomes somewhat floppy.

Although the camel can drink almost 13 gallons (4 liters) of water and possesses a three-chambered stomach, it does not store water. The camel's ability to go for days without water is due not to the camel storing water but rather to conserving it. The camel's body efficiently distributes the water and filters waste.

—Timothy May

the hot and sandy deserts of Arabia and the Sahara, where the dromedary ruled supreme, or the cold and gravelly deserts of the Gobi and Taklamakan, where the Bactrian camel was the pre-eminent animal of transport. The two types met in the central Asian deserts of Sogdiana and Khorezmia (largely present-day Uzbekistan, Tajikistan, and Turkmenistan).

Both camels were perfectly adapted for arid climates, although the Bactrian camel was better suited to colder environments and the dromedary for warmer ones. The dromedary was a common animal in use in Mesopotamia by 1000 BCE and even earlier (3000–2500 BCE) in Arabia, where it is believed to have originated. It is difficult to ascertain when the Bactrian camel was first domesticated, but evidence indicates that it was a domesticated animal in the steppes of Mongolia around 2000 BCE.

The spread of camel domestication went hand in hand with the opening of trade routes. Without the camel it was almost impossible to access desiccated interior regions, such as those of Arabia. By the second millennium BCE, inland trade routes emerged and radiated out from Arabia's coastal trade routes along the Red Sea. The primary purpose of these trade routes that now connected Arabia to the cities of Mesopotamia and Syria as well as Egypt was the transportation of incense from Yemen, its place of origin. A side effect of the incense trade was that it also led to Semitic migrations into these regions. In central Asia (present-day Kazakhstan, Turkmenistan, Uzbekistan, Tajikistan, Kyrgyzstan, and China's Xinjiang Autonomous Region) and Inner Asia (Mongolia, Siberia, Manchuria) the camel functioned in a similar way, allowing goods from the deserts to travel to trading cities and vice versa.

As either type of camel can carry roughly 400 pounds (about 180 kilos) for 20 to 25 miles (32–41 kilometers) without pausing (and larger loads for a shorter distance), it was the natural animal for merchants to use. Unlike wheeled vehicles, the camel could travel easily across broken terrain through regions where roads were unknown. Furthermore, it did not require as much water as horses, donkeys, or oxen. This aspect alone fundamentally changed trade routes, as now one could travel across a desert rather

than following watering holes at regular intervals. Despite the ability to traverse a wide range of terrain, camels of either type did not do it rapidly. The average speed of a camel is 2 or 3 miles (3–5 kilometers) per hour. Of course, the camel, as evinced in racing camels today, can gallop 12 miles (19 kilometers) per hour but only for short distances.

Beyond their use as beasts of burdens, camels were also used in warfare. During mating season, bull camels can be quite dangerous, and this carried over to the battlefield. Still, their primary military purpose was for transportation across the desert and as beasts of burden. Nonetheless, they could prove effective in combat; ancient writers commented that cavalry horses often shied away from camel-riding enemies, possibly due to the aroma emitted by camels.

Camels also produced numerous products that provided sustenance, clothing, and even shelter. Camel milk from the dromedary and Bactrian has a lower fat and lactose content than that of cows, yet it has higher amounts of Vitamin C, iron, and potassium. Camel meat could also be eaten, but because of the value of camels, it was considered a delicacy or eaten only out of necessity. As with all animals, its skin was converted into leather or worn with its wool. The undercoat of the Bactrian camel can also be plucked, like cashmere from goats, and woven into warm blankets and garments. Finally, camel dung was also a useful product. Dried, it could be burned as fuel, but also when mixed with other materials such as sand or clay, it functioned as plaster and even mortar for building purposes.

Greek Periploi

Throughout most of history in most places of the world, people have navigated on the basis of practical knowledge handed down from one generation of navigators to the next. Literacy added a new dimension to the navigator's art by enabling experienced seamen to transmit information about distant waters to people unknown to them and, conversely, to sail waters unknown to them by personal experience. The earliest such navigational instructions that survive today comprise a small corpus of ancient Greek and Latin texts known as *periploi*, from the Greek word meaning “to sail around” or “to circumnavigate.” In addition to navigational instructions, these frequently include ethnographic details about the people and information about goods available in various places, this information being every bit as important to merchant sailors as details about the availability of restaurants, showers, and ship chandlers are for cruising sailors today.

Although it does not survive, the oldest *periplus* known from any description was written by Scylax of Caryanda (in Caria, Asia Minor), whom the Persian emperor Darius commissioned to sail from the mouth of the Indus River to the Red Sea in the late sixth century BCE. His

30-month voyage followed the coast of southern Pakistan and Iran across the Gulf of Oman to the Arabian Peninsula and the Red Sea. Scylax completed his voyage, but his description of the waters he traversed is lost.

The oldest extant periplus is that of Agatharchides of Cnidus (also in Caria), *On the Erythraean Sea*—the ancient Greek name for the Indian Ocean, Persian Gulf, and Red Sea—written in about 140 BCE but based to a large extent on texts from the previous century, the heyday of Ptolemaic Egypt's trade with the Indian Ocean. None of Agatharchides' work is preserved by itself, but portions of books 1 and 5 have survived in the later works of Diodorus Siculus, Strabo, and Photius who in the custom of the age borrowed liberally, and often verbatim, from other writers. *On the Erythraean Sea* described not only the places that a merchant sailor would visit and their distances from one another but also the goods available for purchase and what the people would accept in exchange.

The anonymous first-century CE *Periplus of the Erythraean Sea* is the oldest work to survive in and of itself. A handbook for Indian Ocean traders in the first century of the Roman empire, it provides a wealth of information about trading places and goods along two primary itineraries leading south from Egypt. One follows the coast of East Africa as far as Rhapta (near Dar es-Salaam, Tanzania), and the other hugs the coast of the Arabian Peninsula from present-day Saudi Arabia to Yemen and Oman and from there across the Arabian Sea to the South Asian ports between Barbarikon on the Indus River and Muziris (Cranganur) in southwest India. The author of the *Periplus* distinguishes five primary trading areas: the Red Sea, East Africa, and southern Arabia in the west, the Persian Gulf (about which he writes little), and India in the east. The author focuses on goods imported to and exported from Egypt. Utilitarian objects such as raw metals, tools, blankets and clothing, and horses and mules make up the bulk of the exports. The most important imports were Yemeni myrrh and frankincense, so important in religious rituals of the day, and Indian pepper. Other high-value items included tortoise shell, ivory, rhinoceros horn, and nauti-

➤ A DIFFERENCE OF DEGREES—ERATOSTHENES, PTOLEMY, AND COLUMBUS

When floating his idea to sail west from Europe to Asia in 1492, Christopher Columbus had to overcome the fear that the distance was too great. Although the Greek geographer Eratosthenes (ca. 275–194 BCE) had accurately calculated the circumference of the earth at 250,000 stades, Ptolemy used a figure of only 180,000 stades. Relying on Ptolemy's unimpeachable authority, Columbus determined that Japan was 2,400 miles (3,863 kilometers) west of the Canary Islands and China 3,550 miles (5,713 kilometers) from the islands rather than 10,600 and 11,760 miles (17,059 and 18,926 kilometers), respectively. Without these miscalculations, however, it is unlikely that he could have found either patrons or crew for a westward voyage of discovery.

—Lincoln P. Paine

lus shell from Africa and Arabia; turquoise, lapis lazuli, onyx, agate, pearls, diamonds, and sapphires from greater India; and Chinese silks imported via India. The author mentions the Indian port of Barygaza (Bharuch) more than any other, but he names 17 more between there and Cape Comorin (the southern tip of India), which clearly indicates the growing scope of Roman interest in the trade of the Konkan and Malabar coasts.

That these Indian Ocean *periploi* garner most of our attention is an accident of history: they are almost the only ones to have survived. Classical literature is replete with descriptions and quotations of comparable trading itineraries and inventories from the Mediterranean Sea and the Black Sea that are no longer extant. A fifth-century BCE *periplus* from Greek Massilia (Marseilles, France) is known to have described the Atlantic coast as far as Britain. The fifth-century CE *Ora Maritima* by Avienus, but probably based on earlier sources, originally covered the Black Sea, Mediterranean, and Atlantic coasts. The only extant chapters treat the coast from Massilia to Gades (Cadiz), just west of the Strait of Gibraltar.

Changing Shipbuilding Technology around the Mediterranean

Shipbuilding techniques in the ancient Mediterranean can be traced through both pictorial and archaeological evidence; written documentation is virtually nonexistent until the last millennium. Generally speaking, there are two ways to build a ship's hull. In shell-first construction, the planks that form the sides of the hull are fastened to one another to create the hull (or shell),

and lateral frames and ribs are inserted to stiffen the form afterward. In frame-first construction, the ship's frame is erected first, and planks are fastened to this skeleton. Shell-first construction was the standard method of shipbuilding in the Mediterranean until 500 CE.

The methods of fastening planks, frames, and ribs varied considerably, but again there were two primary practices. The oldest seems to have been the sewn-boat tradition in which holes were drilled in the planks and cordage passed through the holes to stitch the planks one to another. Many boatbuilders penetrated the plank completely so that the stitching is visible from both inside and outside the hull. This method is especially common among Indian Ocean boatbuilders, and the rather ramshackle appearance gave foreign observers a negative view of the sewn-boat tradition, although sailors have traversed the Indian Ocean in sewn ships for millennia, often with complements of 200 or more people and large or unwieldy cargoes such as elephants and horses. Egyptian shipwrights drilled holes obliquely from the broad side of the plank to the narrow edge so that the stitching was only visible from the inside.

More common in the ancient Mediterranean was the use of mortise-and-tenon joints. Mortises were cut into the edge of the planks and tenons inserted into them, a system that prevented the planks from sliding against each other. The disassembled hull of the Khufu ship found alongside the Great Pyramid at Giza, where it was buried about 2500 BCE, was fastened with both mortise-and-tenon joints and cordage. Tenons could be further secured by inserting pegs perpendicular to them to lock them in place and prevent the planks from pulling apart. Such a process is described in book five of Homer's *Odyssey*, when Odysseus builds himself a small ship to escape Calypso's isle.

Mortise-and-tenon fastening remained the norm in the Mediterranean until about the seventh century CE. A ship found in the waters off Yassi Ada, an island on the south coast of Turkey, belongs to a transitional shipbuilding phase midway between hull-first and frame-first techniques. In the lower part of the hull the shipwrights edge-joined the planks using unpegged widely spaced mortise-and-tenon joints,

► INDUSTRIAL SHIPBUILDING IN THE ANCIENT MEDITERRANEAN

Although it is technically more difficult to reproduce the shape of a hull built using the shell-first technique, widely scattered evidence indicates that ancient shipwrights developed systems for doing just that. Reassembly of the Khufu ship (2500 BCE) was facilitated by the presence of carpenter's marks in the ancient hieratic script on various pieces of the hull. Likewise, the hull pieces of a third-century BCE Carthaginian ship discovered off the coast of Sicily bore shipwrights' marks to indicate their placement in relation to one another. Such sophisticated industrial planning and organization was not matched again until the Industrial Revolution.

Reconstructed Khufu ship, or Solar Barge of Cheops, found near the Great Pyramid at Giza, 2500 BCE.
(Paula Stanley)

a process doubtless faster and cheaper than the elaborate joinery of earlier vessels. Above the waterline, however, the shipwrights simply nailed the strakes and wales to existing frames. The advantages of frame-first construction are considerable. The joinery is less labor-intensive and requires less wood, ships can be built faster, hull forms can be duplicated more easily, and damage can be repaired more quickly. The shift to frame-first construction helped set the stage for the next evolution in naval architecture in the fourteenth century.

Watercraft in North America

Direct archaeological evidence of indigenous watercraft in North America is rare and suggests ephemeral watercraft such as reed boats or rafts, skin boats, and bark canoes whose perishable materials do not survive well in saturated soils. Consequently, the archaeological record tends toward overrepresentation of the far more durable log dugouts and plank canoes. The best empirical evidence for making and maintaining canoes comes from southern California and has sparked a lively debate on the origins of the Chumash plank canoe.

Along California's coast, indigenous peoples tied bundles of reeds together to form simple rafts or canoe-shaped watercraft called *balsas*, which they poled and paddled on lakes, rivers, and coastline. The three- and five-bundle reed boats were quick to make, buoyant, and easy to handle and could be coated with asphaltum to prevent the watercraft from becoming waterlogged. The five-bundle balsa with its higher and more durable hull was a more substantial watercraft with a greater carrying capacity, and noted

archaeologist Brian Fagan has made the case that it served as the prototype for the early planked canoe, perhaps as early as 8,000 years ago. No direct evidence of reed boats, however, has survived in the archaeological record. The most common watercraft in the Arctic region prior to contact was the kayak, a one-person skin boat used for hunting and fishing, and the umiak or “womens’ boat,” a larger skin boat used for transporting people and cargo. Direct evidence for prehistoric skin boats is scarce (e.g., portions of a paddle blade), and the earliest of what is available does not predate 1400 CE (e.g., wooden kayak parts found at the Nukleet site at Cape Denigh in Alaska). But given the maritime expertise of the Denbigh people, who spent their summers hunting seals and other marine mammals on the Bering Sea coast circa 3000–1000 BCE, it appears that skin boats were under development as early as 5,000 years ago. The ethnographic and ethnohistoric record indicates that throughout temperate North America indigenous groups used the bark canoe to ply the rivers and lakes from Maine to central Alaska. The bark canoe engineered in North America had many advantages: speed, the strength to withstand heavy use, easily repairable, able to carry heavy loads in shallow water, and lightweight enough to be carried overland. Unfortunately, it remains impossible via the archaeological record to determine how or when the bark canoe came into existence.

Archaeological evidence indicates that native groups living along the coastlines of California, Florida, and other parts of the eastern seaboard as well as on the banks of the Mississippi River and across the Great Lakes made use of dugouts. Archaeologists have recovered a dugout canoe of white oak with a radiocarbon date of 1600 BCE from the waters of Lake Erie, and in Florida the remains of a pine-log dugout yielded a radiocarbon date of 300 CE. Iconographic evidence for the dugout includes a petroglyph 13 feet (4 meters) long of a canoe carrying six individuals recorded in Valle Verde County, Texas. Associated artifacts suggest an Early or Middle Archaic date. Dugouts are labor-intensive to make and are generally found in more settled cultures with the tools (e.g., adzes, gouges, and wedges) and resources (e.g., suitable trees, surplus food supply) necessary for their manufacture. They can be

➤ CHUMASH TOMOLS

The origins of the Chumash plank canoe, or *tomol*, is currently under debate. Based on archaeological evidence from Eel Point on San Clemente Island and other early Holocene sites in the Santa Barbara Channel region, Brian Fagan, Jim Cassidy, and others make a case for the local development of a tomol prototype by 6000 BCE. While the mariners of Eel Point certainly needed a durable and swift canoe for big-game fishing and regular passage between the islands and the mainland, Jeanne Arnold and Lynn Gamble propose a much later date of 500 CE for the appearance of the plank canoe itself. Both camps, however, repudiate the idea that a tomol prototype hails from Polynesia.

—Whitney Leeson

widened by forcing the sides apart with wooden struts after softening them with fire and water. If a group had the necessary skill set and tool kit (e.g., asphaltum canoe plugs, caulking, trifacial stone drills) to manufacture planks, then the sides of the dugout could be extended by fastening planks to the watercraft, a boatbuilding technique that helps prevent swamping in rough seas. The Chumash along the southern coast of California depended upon either the *tomol*, a sophisticated planked canoe, or its prototype to hunt for tuna, swordfish, and dolphin off the islands of the Santa Barbara Channel circa 300 CE, as evidenced by the abundant remains of harpoons, bone barbs, and deep-sea fish remains.

■ Introduction: The Origins of the Pacific Peoples

For many people, the Pacific Ocean and its islands bring a vision of sun, beach sand, coconut palms, and a languorous life. This vision was largely created in the eighteenth century by European explorers of Polynesia who, weary after months at sea, thought they had found “man in a state of nature.” The painter Gauguin, the author Robert Louis Stevenson, and others fostered this view in the nineteenth century. More recently it is mostly used by travel agents. Recognizing that it is a vision is the first step to appreciating the Pacific.

The Pacific Ocean is, in reality, a complex of natural and human environments. On the western side, islands are large and high; moving east, there are fewer and smaller islands that are farther apart. Many are atolls, just 3–7 feet (1–2 meters) above sea level, with an extremely limited range of plants and animals and no surface water. In some parts of the Pacific destructive cyclones

are common, while in others droughts are regular. In the west, malaria and other diseases are rife. Life is not easy on many islands.

Peoples of the Pacific were divided by early Europeans into three groups: Polynesians (many islands), Micronesians (small islands), and Melanesians (islands of black people). These groupings were thought then to be internally united—or at least distinguished from each other—by race, language, and culture. Today the divisions are maintained largely for convenience of discourse and as a result of modern political realities, for Polynesia is the only one that anthropological research shows to be based in deep sociocultural realities.

Prehistorians and some linguists divide the Pacific differently, into Near and Remote Oceania. The former includes New Guinea and the large islands as far as the southern Solomons, all of which people have occupied for at least

MAP OF PACIFIC SETTLEMENTS

40,000 years. Remote Oceania consists of all the rest of the Pacific islands, none of which were settled more than 3,500 years ago.

—Peter White

Micronesia

Micronesia consists of 2,400 islands covering about 1,040 square miles (2,700 square kilometers) lying in more than 2.7 million square miles (7 million square kilometers) of ocean. Guam, the largest island, occupies one-quarter of the total landmass. Nearly all the islands are tiny. Most of them are also atolls, ringlike coral islands.

The oldest settled locations are in the west. Sites in several islands of the Marianas chain date to about 3,500 years ago. These are beach-side middens with red-slipped shell-tempered pottery, shellfish, and fish bone and, in some sites, *Tridacna* shell adzes. The pottery is similar in form and decoration to that of the same date in the Philippines, about 1,600 miles (2,600 kilometers) to the west. Languages in the Marianas also link these islands to the Philippines, and prevailing winds suggest that colonization from this direction is the most probable.

Claims for human arrival 1,000 or more years earlier have been made for several Mariana islands on the basis of increases in charcoal particles and the presence of possible plant domesticates in pollen cores. Climatic causes and site-specific stratigraphic uncertainties render these claims problematic.

The history of the islands of the rest of Micronesia is different and apparently shorter, with the oldest reliable dates being no more than 2,000 years ago. All of these early sites are coastal, semisubmerged, and on fringing reefs,

Ruins of the human-made canals at Nan Madol. (C. T. Snow)

implying that houses were built on wooden stilts. Artifacts include many *Conus*-shell ornaments such as earrings and shell adzes. Shell-tempered undecorated small bowls and globular jars with everted rims are very much like ceramics from the southeastern Solomons and northern Vanuatu of the same date. The languages of eastern Micronesia strongly confirm this area as a likely source of settlers.

Many of the Micronesian islands are atolls, tiny areas of land perched 3 to 10 feet (1 to 3 meters) on top of a coral reef. Maintaining human life on these required particular adaptations based around the rain-fed shallow freshwater aquifer (Ghyben-Herzberg lens) that underlies many of them. While coconuts and Pandanus species could be planted anywhere, the cultivation of the starchy staple the giant swamp taro (*Cyrtosperma chamoissonis*) required a pit excavated into the aquifer and mulched with organic debris. The oldest pits date from the time of earliest settlement, which suggests that the technique was based on considerable prior knowledge of the plant and its requirements.

Archaeologically, Micronesia is probably best known for its two dramatic monumental sites, both on high islands: Nan Madol (Pohnpei) and Leluh (Kosrae). These have been the focus of many fantastic interpretations, but archaeological research over a century shows a long history and slow growth.

Nan Madol consists of 93 artificial islets built of stone walls with coral and stone fill, the whole surrounded by massive seawalls. Much of the stone used is natural columnar basalt, which is not available in the immediate vicinity, and thus the site is evidence for considerable organization and effort. Occupation of the areas starts about 2,000 years ago, when wooden stilt houses were built in the tidal zone. Small artificial islets, using stone, were first built about 500 CE, with megalithic building occurring some 500 years later and continuing for several hundred years. The site in this last period was the administrative center, residences, and burial area for the Saudeleur elite, which may for a time have ruled over the entire island. Burials and many artifacts, including thousands of shell beads, have been recovered from this time.

The history of Leluh and its methods of construction are basically similar to those of Nan Madol.

Melanesia

Melanesia, Near Oceania, consists of New Guinea, the Bismarck Archipelago, and the Solomon Islands, all of which were settled in the Late Pleistocene. New Guinea itself was probably settled at the same time as Australia, at least 50,000 years ago, since the two were physically joined until about 8,000 years ago.

Pleistocene environments in the area were a few degrees cooler and rather drier than today. This made the highland areas—greater than 4,900 feet (1,500 meters) above sea level—less

hospitable to humans. In the lowlands, pollen analysis shows relatively little change in the coverage of tropical rain forest and wet sclerophyll.

The earliest evidence of humanity is found on the Huon Peninsula and consists of some large axlike tools, with a waist for hafting, made on slices of water-worn boulders. A few of these are stratified between layers of volcanic tephra dated by potassium-argon dating to more than 40,000 years ago.

Sites dated by radiocarbon to 30,000–40,000 years ago are found throughout Near Oceania. Most of them contain only stone artifacts, used primarily for making wooden tools and in food processing. In New Ireland, where a steep coastline means that sites were near the shore even at times of lowered sea level, the record shows that shellfish were collected and small fish were caught. The same is likely true elsewhere, but the sites have been drowned by the rising sea.

Obsidian, found in the Willaumez Peninsula of New Britain, was used locally for artifacts from the time of first settlement. From 20,000 years ago it was exported to other areas up to 375 miles (about 600 kilometers) away, one of the world's oldest long-distance trades. In the Holocene, before 3,500 years ago, silled Willaumez artisans made large, elegant crescent-shaped tools from obsidian. Probably ceremonial and certainly very difficult to make, these have been found throughout Near Oceania, hinting at an exchange system of which we know nothing else.

Apart from New Guinea, Near Oceania was faunally depauperate. On New Ireland, the only mammals were bats. In the Solomons there were also five species of endemic rats, two weighing 2 pounds (1 kilogram) or more. Between 20,000 and 5,000 years ago several animal species, including a wallaby, two phalangers, and rats, were moved from New Guinea and New Britain to other islands. With the larger animals this must have been deliberate, but whether it was for food, their decorative fur, or originally as pets is hard to determine.

Settlement of higher altitudes also began by at least 30,000 years ago. At Kosipe, 6,500 feet (2,000 meters) above sea level, waisted blades, thinner and finer than those of the Huon, are stratified between dated tephtras. The site is near a swamp, where edible pandanus fruit grows. A

core from the site shows human disturbance, including charcoal from firing. Other Pleistocene sites, such as Nombe, show that people were hunting and gathering. Their prey may have included a now-extinct diprotodon. While there is no clear evidence of agriculture older than the Kuk site, tree curation and planting of taro and sugarcane is likely.

Studies of present-day languages and human biology confirm that the area has been inhabited for tens of thousands of years. The original language groups of the area cluster into at least 23 families, all of them completely unrelated either to each other or to languages elsewhere in the world. Biologically, there is a suggestion that some highlanders may be related to Australian Aboriginals, but the link is very indistinct and is disputed.

Island Melanesia, stretching south and east of the Solomons, was populated only from about 1100 BCE. It was settled within only two centuries by people who made Lapita pottery. Their languages were all within the Austronesian family, and they were certainly horticulturalists. Since some of these islands are long distances apart and not intervisible, these explorations and settlements are considerable achievements, and the term “Vikings of the Pacific” has been used about them.

Polynesia

The Polynesian triangle, bounded by Hawaii, Easter Island, and New Zealand, was reached only when people settled in Samoa and Tonga about 800 BCE. These people were the most easterly part of the Lapita Diaspora, pottery-making horticulturalists who spoke Austronesian languages. Their immediate homeland was Fiji, and before that, islands to the west, to which they are linked by language, biology, and material culture, including the plants they grew, such as taro and breadfruit, and the domestic animals (pig, dog) they brought with them.

These settlements and the populations that grew from them developed their distinctive Polynesian culture, which included new forms of stone adze and the giving up of pottery and elaborate fishing gear, in these islands. Reconstructions of their languages suggest that *tapu* (sacredness) and *mana* (spiritual power) were at the core of their belief system.

As populations grew so did social complexity and with it monumental building and intensified forms of food production, such as irrigated pondfields for taro. Monuments included star-shaped mounds, walled fortifications, and, on Tonga, rectangular burial platforms faced with stone blocks and a massive trilithon. Tongan power in the last millennium reached beyond Tonga to many smaller islands, and its warriors went as far as Fiji.

The settlement of eastern Polynesia begins with the Society Islands and the Marquesas about 500 CE. From somewhere in this central region, the more distant islands were settled, Easter Island and Hawaii about 800 CE, New Zealand only about 1200 CE. These migrations must have been quite large and well equipped. New Zealand oral history speaks of several (perhaps seven) canoes, and certainly more than a handful of people were required if the migrants were to survive and prosper. Evidence in the form of stone artifacts geologically identified to particular sources shows that not all migrations led to permanent isolation. Notably in the first millennium CE, exchange between island groups occurred, implying large sailing canoes and good navigational techniques.

Each island group developed its own version of Polynesian culture after settlement. In Hawaii,

population growth led to very highly hierarchical societies, which put much energy into building enormous temples, and a similar pattern occurs on many islands in the Society and Cook groups.

New Zealand is probably the most distinctive Polynesian society since the climate restricted the growing of most known crops to the far north. Additionally, when people arrived the islands were home to many species of birds and no mammals except bats. Some of the *moa* birds were larger than a human, and for the first century or more many settlers made a living from hunting these, fishing, and collecting prolific wild bracken root. Their experiments showed, however, that sweet potato (*Ipomoea batatas*) could be grown throughout the North Island but required careful storage over winter. It was on this staple that large populations developed there, while the South Island remained nonagricultural until the arrival of the common white potato (*Solanum tuberosum*) with Europeans in the nineteenth century.

Polynesian exploration and settlement did not stop at the large islands. The tiny, isolated Norfolk Island, 130 square miles (345 square kilometers), was occupied for a brief time around 1400 CE by New Zealanders who brought with them obsidian from Raoul Island and possibly New Zealand. The low, cold Chatham Islands, 500 miles (800 kilometers) east of New Zealand,

were settled at the same time: those people remained because there was no way of returning to New Zealand. The same is true of Easter Island, where giant human faces were sculpted, adorned with red topknots and white eyes, and set up in rows on temple platforms.

Polynesians almost certainly reached South America. It is now certain that sweet potato was grown in Polynesia by 800 CE, and it can only have been obtained from that continent. There is no other evidence that South Americans reached Polynesia (Heyerdahl's theories of a South American migration are demonstrably wrong), while Polynesian voyaging capabilities made a trip to South America and back quite feasible.

Politics and Statecraft

In 27 BCE, the Roman Senate conveyed the titles of Augustus (illustrious one) and princeps (first citizen) upon Octavian, the man who had defeated Marc Antony and Cleopatra at the Battle of Actium and who had been gradually consolidating his authority as sole ruler of the Roman empire. From this point forward, historians refer to him as Augustus, and many see this moment as a fundamental turning point in Roman history, when the republican form of government was replaced by a government with sole authority vested in one man, a form of governance that would remain dominant throughout the Mediterranean and beyond for over 1,000 years. Gaining these titles was one example of Augustus's skills at political machination. He was in fact a master of behind-the-scenes manipulation and coercion and was one of the first true masters of self-conscious political propaganda. By carefully controlling his image at the same time that he had it duplicated throughout the Roman world, he was able to portray himself as the embodiment of the Roman state: a soldier, a priest, a scholar, and a politician. Those who criticized Augustus were dealt with harshly; the poet Ovid, who dared criticize Augustus's blatant propaganda, was expelled from the city of Rome.

This self-conscious political engineering, which seems so natural a part of political life today, was not unique to Rome. It was in ancient Athens that the notion that the people should govern themselves first arose and concomitantly the arts of political rhetoric thrived. Of course, Athenian democracy was not democracy for everyone. Only citizens of Athens were allowed to vote, and citizenship was very strictly defined (excluding women and slaves, for example). Whereas power was vested in the citizenry of Athens (even if definitions of who composed the citizenry were relatively strict), the situation in Qin dynasty China was significantly different. In 221 BCE, China was unified for the first time under a strictly centralized monarchy. This strict rule did not last long, and in 206 BCE the Western Han dynasty arose, gaining the throne in 202 and ruling China until 8 CE. Under the Western Han, China reached the height of its power with a centralized state run by bureaucrats who operated, at least in theory, according to Confucian principles. After a series of dynastic struggles beginning in 8 CE, the Han regained power, inaugurating the Eastern Han dynasty in 25 CE that lasted until 220. Once Han authority collapsed, the Chinese political system splintered into a number of separate polities, leaving China disunited until unification under the Sui dynasty in 589.

The Indian subcontinent was also first united at this time. From circa 322 to 185 BCE, the Mauryan dynasty ruled the Indian subcontinent.

From circa 322 to 185 BCE, the Mauryan dynasty ruled the Indian subcontinent.

Under the Mauryans, the religions of Jainism and Buddhism thrived alongside of Hindu traditions, and the subcontinent was ruled as four provinces under the control of one emperor.

Under the Mauryans, the religions of Jainism and Buddhism thrived alongside of Hindu traditions, and the subcontinent was ruled as four provinces under the control of one emperor. The emperor controlled this diverse region through a large standing army, perhaps the largest standing army that had yet existed. This army initially allowed the Mauryan emperors to greatly expand the territory of their empire. However, Emperor Aśoka (304–232 BCE), after his conversion to Buddhism, attempted to practice the nonaggressive way of Dharma in which his rule of the subcontinent was not based on violence but rather by sup-

porting Buddhist *sangha* and developing a close relationship between state and religion.

The period from 1000 BCE to 300 CE was the time of the first world empires, meaning situations in which a large state-based multiethnic polity formally rules over other polities. Arguably, Egypt held land outside of what were considered its natural borders centuries earlier; the administration, however, was relatively ad hoc and informal. Starting with the Assyrians and later the Babylonians, Kushans, Persians, Macedonians, Parthians, Mauryans, Han Chinese, and Romans, bureaucratic structures associated with empires arose. For example, the Cyrus Cylinder (called a cylinder because it was a cuneiform inscription written on a clay cylinder), written after the Persian conquest of Babylon in 539 BCE, decrees a limited amount of ethnic autonomy to different groups within the empire, although scholars debate how much this reflects genuine tolerance and how much it reflects political propaganda. New technologies of warfare and transportation allowed rule over much greater distances and allowed for a greater economic integration of far-off parts of the empire.

Even writing on the art of statecraft appears for the first time in this period. There is a vast amount of literature on this topic that has survived to the present day. Plato's *The Republic*, in which a vision of an ideal state is espoused, is one of the most important examples of these. Aristotle's *Politics* discusses different types of governments. Political speeches, while not in reality verbatim accounts of ancient speeches, are preserved, most famously "Pericles' Funeral Oration" in the history of Thucydides. Political biography and analysis appear in this period; Suetonius's *Twelve Caesars* compares the lives of 12 rulers of Rome. In the Maurya empire in India, Kautilya Chanakya (ca. 350–283 BCE) is credited as author of the *Arthashastra*, which is an extended treatise on statecraft that includes discussion of state military strategy, economic policy making, and the conduct of government officials. Much Chinese literature on statecraft has also survived; government was of interest to Daoist, Legalist, and Confucian writers, among others. Chinese writing on government is tremendously varied in this period. Sometimes the literature explored very specific problems, such as the first-century BCE *Discourse on Salt and Iron*, which discusses state

monopoly on the production and distribution of salt and iron. Other texts are more philosophical in nature, such as the *Guanzi* (edited around 26 BCE), which purports to preserve the writings of Master Guan, a government official of the seventh century BCE.

■ Introduction: Political Life in Ancient Africa

From 1000 BCE to 300 CE Africa was the home to societies of widely differing sizes. On the one hand, the civilizations of Egypt and Kush were among the largest states the world had yet known. On the other hand, archaeologists have unearthed evidence of small villages scattered throughout much of the continent (although many of these have not yet undergone extensive excavation and study). The following entries illustrate some of the diversity of African political life in this period through the examination of some of the societies that are best known archaeologically.

—Kevin M. McGeough

The Meroitic Period

The Meroitic period was the second historical phase of the Kingdom of Kush. Although Meroe was the location of the royal residence from the fifth century BCE onward, the move of the royal cemetery from Nuri to Meroe is actually considered the start of the Meroitic period at around 300 BCE.

The Meroitic period was characterized by a greater emphasis on Kushite culture and traditions, as demonstrated by the adoption of Meroitic as the official language of the kingdom, the incorporation of indigenous Kushite gods in the pantheon, and the development of typical Meroitic style in art.

Life in the Meroitic period was similar to that of the Napatan period. The *qore* (Meroitic word referring to the king as “commander”) or the *kandake* (Meroitic word meaning “ruling queen”) dealt with the political affairs and maintained order in a kingdom that at its greatest expansion might have extended from Lower Nubia

to the region of Sennar on the Blue Nile. Like a pendulum, Lower Nubia was at times controlled by the Kushites and at other times by the Greek rulers of Egypt, the Ptolemies. When Egypt became a province of the Roman empire, the Kushites laid claim to Lower Nubia by raiding the cities of Philae, Syene (Aswan), and Elephantine, all in the First Cataract region. The Roman Prefect Petronius retaliated, and the Roman Army marched as far south as Napata, which it sacked. After much negotiation, an agreement with Rome was reached. The kandake Amanishakheto is believed to be the one who negotiated with the Romans and gained control of the southern half of Lower Nubia. The Romans controlled the northern half.

As their Napatan ancestors did before them, the Meroites built new temples dedicated to Amun, notably at El-Hassa and Naga (near Meroe) as well as at Dangeil (Fifth Cataract), Amara East (Second Cataract), and Dabod (Lower Nubia).

➤ MEROITIC LANGUAGE AND SCRIPT

Meroitic was the native language of the Kushites. This language might have been spoken in Nubia for millennia, but it did not have a written form until the Meroitic period, when it became the administrative language of the Kingdom of Kush.

Meroitic was written using hieroglyphs or a cursive script. The 23 signs of the Meroitic alphabet are derived from ancient Egyptian hieroglyphs and demotic (a cursive script). The phonetic (sound) value of the Meroitic signs is known, but the meaning of most words is unknown. Until Meroitic is fully deciphered, much of the culture will remain a mystery.

—Caroline M. Rocheleau

This flurry of architectural activity also included the construction of several temples to the local lion-headed god Apedemak, such as at Meroe, Naga, and Musawwarat es-Sufra. Restorations of earlier New Kingdom and Napatan temples were also deemed important especially to King Natakamani and Queen Amanitore, who are known for their active building program. This royal couple even repaired the Great Temple of Amun at Napata after it was sacked by the Roman Army.

The reasons for the collapse of the Meroitic period Kingdom of Kush remain unclear to this day. From two inscriptions found at Aksum in Ethiopia, it appears that an unnamed Aksumite king captured the city of Meroe during the fourth century. Scholars wonder, however, if this and other attacks by the Kingdom of Aksum were enough to bring the mighty Kingdom of Kush to its end. It has been suggested that the royal family's wealth and power might have been crumbling compared to a now very powerful and extremely wealthy nobility. However, until the Meroitic language is fully understood, the collapse of the Meroitic Kingdom of Kush will remain a mystery.

The Kushite Twenty-fifth Dynasty of Egypt

The Kushite Twenty-fifth Dynasty of Egypt refers to the five Napatan kings of Kush who conquered Egypt and controlled it between 716 and 656 BCE. The first of these Napatan kings was Piye (Piankhi), who moved north into Egypt during the 21st year of his reign and seized control of the country. The account of Piye's triumphant campaign is told with great detail on a block of pink granite known as the Victory Stela of Piankhi (at the Egyptian Museum, Cairo). The Kushites' motive for the invasion was the restoration of the cult of Amun at the time when

Egypt was fragmented and ruled by competing dynasties: the Twenty-second and Twenty-third Dynasties (both from Libya) and the Egyptian Twenty-fourth Dynasty. In the Kushites' minds, they were the legitimate heirs of the Pharaohs because Egypt and Kush were once united under the god Amun in the past.

Despite the fact that he controlled Egypt, Piye preferred ruling from Napata. At his death his vassals (subordinates) rebelled, and it was his brother and successor Shabaka who reinvaded Egypt and established the capital at Memphis, where he resided. Shabaka enthusiastically embraced Egyptian customs and religious rituals and was even interested in traditions dating back to the Egyptian Old and Middle Kingdoms (2686–2184 and 2040–1650 BCE). The Shabaka Stone (at the British Museum) is a good example of the Kushites' cultural interests. Shabaka, horrified to see the decay of a papyrus containing the creation myth of Memphis, had it copied on stone lest it be lost forever.

Shabaka's reign is also marked by the rise of Assyria in Near Eastern politics. Although he managed to keep the Assyrians at bay, the nephews who succeeded him were not so lucky. Sha-

Reerected column of the Taharqa kiosk at the Temple of Amun at Thebes. (Caroline M. Rocheleau)

baka supported Palestine and Phoenicia in a revolt against their Assyrian master, which did nothing but increase the threat against Egypt. His brother Taharqa crossed swords with the Assyrians. In 673 the Kushites managed to ward off the enemy; however, in 671 the Assyrians invaded Egypt and sacked the capital of Memphis. Taharqa evaded capture and fled south to Thebes. A later uprising brought the Assyrians back to Egypt, and Taharqa lost Memphis again. This time he fled south to Napata, leaving the mayor of Thebes to surrender.

Taharqa's reign was nonetheless the most outstanding of that dynasty. Architectural monuments commissioned by this king abound in both Egypt and Kush. At Thebes, Taharqa constructed a colossal kiosk at the Temple of Amun, demonstrating—like several pharaohs before him—his piety and power. In Nubia, Taharqa refurbished

earlier New Kingdom temples and also built new temples to Amun in various cities.

Taharqa's successor was his cousin and co-ruler Tanwetamani, who was crowned at Napata. Tanwetamani's ambition was to reconquer Egypt. As he moved north, he reclaimed Aswan, Thebes, and eventually Memphis. The Assyrians retaliated by sacking Memphis yet again. Thebes was not spared; its magnificent temple was pillaged, and its treasury was plundered. Tanwetamani fled to Napata. At his death in 656, the Kushite Twenty-fifth Dynasty of Egypt died with him.

■ Introduction: The Waning of Egypt and Mesopotamia and the Rise and Fall of Persia

The Iron Age II (1000–586 BCE) was the last period in which Mesopotamia and Egypt were major autonomous powers in the Near East. Egyptian scholars refer to this as the Third Intermediate period, in which power in Egypt shifted between various competing dynasties. Egypt vacillated between being a major world power and being fraught with internal turmoil. Mesopotamia, on the other hand, was relatively stable. For most of this period power was concentrated in the Neo-Assyrian kings, whose capitols were located in northern Mesopotamia. Toward the end of the Iron II, Assyrian power weakened, partially in response to the growing strength of the Neo-Babylonian power in southern Mesopotamia. Eventually these Babylonian kings took over the Neo-Assyrian empire. Throughout the Iron Age II, Egypt and Mesopotamia were often engaged in military conflicts with one another. These intensified toward the end of the period, and the financial expenses of these conflicts may have had a hand in undoing both world powers.

It was the Persians who brought an end to the supremacy of both Egypt and Mesopotamia. Conquering both polities, the Persians grew to have one of the largest empires ever held up to that point. The growth of the Persian empire was arrested by its conflicts with the Greek city-states, but it was not until Alexander the Great of Macedon brought his army to Asia that the Persians were destroyed. All of the Near East fell under the sway of Alexander the Great, and when he died in 323 BCE these lands were passed down to his various successors. Thus, Egypt and Mesopotamia came to be ruled by Greek families (until the Romans laid hold of Egypt), and the Parthians took control of Mesopotamia.

—Kevin M. McGeough

Neo-Assyrian Governance

As Assyria became the dominant regional power in Mesopotamia in the mid-fourteenth century BCE, it sustained its hegemony through efficient

political organization and brutal military force until its defeat in 612 BCE to the Neo-Babylonians. During their heyday in the eighth century, when they are known to historians as Neo-Assyrians, they controlled much of the Levant from the borders of modern-day Turkey to Iran and Egypt. Much of their success in political control over this wide region was due to a powerful and much-feared army.

While allowing many Mesopotamian vassal states to conduct their own affairs at the local level, fear of Assyrian military might ensured steady payment of tribute and domestic stability. Military officials loyal to the Assyrian king served as government officials, governors, and bureaucrats in addition to serving in the Assyrian military organization. While the Assyrians were feared for their coercive military measures in instances of rebellion, they were also known for maintaining a respectful relationship with Babylon, recognized by Assyrian leaders as an important center of Mesopotamian culture and trade.

The Assyrian heartland, or land of Ashur, in northern Mesopotamia was placed at a strategic juncture between the inland kingdom of Babylon while flanked to the west by the Hittites and the coastal trade regions of Syria and Palestine adjacent to Egypt. This central position put Assyria in conflict with these other states as it grew in power. After throwing off their Mitanni overlords in the mid-fourteenth century BCE, Assyrian military expansion in Mesopotamia at the expense of its neighbors lasted well until the seventh century BCE. Resistant populations and the threat of powerful neighbors required Assyria to maintain a large powerful army under the centralized control of the king, who served as commander in chief. As such, the army became the main tool of the king to administer his multiple realms and developed into a highly professional force, with a strong cavalry contingent of Assyrian elites.

Initially, the governors of vassal kingdoms were drawn from local elites who paid sizable

tribute to the Assyrians. Much of this tribute was funneled back to the establishment of Assyrian capital cities and to the immense wealth of the royal court. However, the development of military control in conquered territories led to increased centralized control by Assyrians themselves by the ninth century BCE. When local rulers rebelled, they forfeited their right to rule, and immediately the region came under Neo-Assyrian governance and taxation, thereby becoming Assyrian provinces rather than tributary states. Military force in these conquered regions extended the control of the Assyrian bureaucracy, as mostly all officials were already part of the military.

While the Assyrian king served as the main focus of power throughout the Assyrian realms, the political structure and bureaucracy maintained his authority in tandem with the military hierarchy. The main high officials in the Assyrian bureaucratic structure were the majordomo (*rab sha muhbi*) who served as the king's main deputy, the vice chancellor (*ummanu*) who was the king's scribe, and the two field marshals (*turtannu*) who conducted the king's military policies directly. Governorships of Assyrian provinces were granted to high court officials, with smaller and less important provinces run by subordinate officials. Provincial governors administered their respective Assyrian provinces as if their own state and rule were often hereditary. The standing army provided the necessary force to ensure stability in the region. Bureaucrats also held considerable authority under Assyrian governance, and many of them were educated eunuchs who were loyal and not a threat to local elites. Local affairs at the village level were handled by local governmental bodies such as town assemblies and village councils, which while responsible to the king's authority had significant levels of autonomy in the day-to-day operations of local governance.

➤ ASSYRIAN KING ASHURBANIPAL

King Ashurbanipal (r. 668–672 BCE) was an effective administrator, a promoter of the arts, and an exceedingly cruel conqueror. In addition to constructing the ornate palace at Nineveh, he also commissioned a great library. For this latter project he contracted many scribes to copy ancient texts, thus ensuring the cultural vibrancy and legacy of Assyrian and greater Mesopotamian culture for posterity. Ashurbanipal could not have foreseen the success of this project, since it is through excavations of his library that modern scholars were able to recover much of Mesopotamia's lost literary heritage. In spite of his popularity at home, he also was widely feared by his enemies for his cruelty to defeated states and their leaders. Accounts and images of Ashurbanipal depict him publically demeaning the leaders of his enemies with little mercy, by torturing and decapitating them as a means of displaying Assyrian might and brutality, to deter other potential enemies and internal discontent.

—Abraham O. Mendoza

Neo-Babylonian Politics

Neo-Babylonian political institutions (also known as Chaldean in reference to the name of the dynasty) were instituted after the removal of Assyrian power in 626 BCE, following the death of Assurbanipal in 627 BCE. While Babylon had attained a relatively autonomous and prominent status within the greater Assyrian empire, with military assistance from the Medes, the Chaldeans were able to destroy Assyrian power and sack Nineveh in 612 BCE. Nabopolassar, who led the revolt against the Assyrians, was installed as the first king of the Neo-Babylonian empire in 625 BCE. After a short 87-year history of Babylonian rule of the Fertile Crescent and eventually the greater Levant region encompassing all of Mesopotamia, Palestine, and Syria, the empire eventually fell to Cyrus the Great and his Persian forces in 539 BCE.

While Babylon had held a privileged position within the greater Assyrian empire, it did experience periods of misrule under Assyrian administration. During the instability that followed the

► THE BABYLONIAN CAPTIVITY

The deportation and exile of the leading citizens of the kingdom of Judah occurred following its conquest by Neo-Babylonian king Nebuchadnezzar II in 586 BCE. The Babylonian exile stands as a pivotal event in Jewish history, given that it also marks the end of independent Judah and the destruction of the First Temple in Jerusalem. Furthermore, Judah was the remaining core of the land of Israel, most of which had been annihilated by Assyria and its people dispersed. Those exiled to Babylon were mostly elites, taken to ensure compliance in Judah. According to biblical prophesy, the Babylonian Captivity occurred as a result of God's punishment. Biblical accounts of the Babylonian exile also depict Nebuchadnezzar II and his interactions with Jewish exiles; Nebuchadnezzar is generally categorized in a negative light, and the time spent in Babylon is generally characterized as a period of mourning. As the Neo-Babylonian empire fell to Persian forces, Cyrus the Great allowed the Jews to return to Judah, rebuild their temple, and freely practice their religion in 537 BCE.

—Abraham O. Mendoza

death of the Assyrian ruler Assurbanipal, Nabopolassar, the founder of the Neo-Babylonian empire, sought an alliance with the Medes, also enemies of the Assyrians, to destroy and annex the dominions of the Assyrian empire. The Assyrian realm was dissolved by 612 BCE with the fall of Nineveh, with much of its territory falling to the Neo-Babylonians. Nabopolassar's son, Nebuchadnezzar II, continued the struggle against the rival power of Phoenicia (particularly centered around the city of Tyre and areas in modern-day Lebanon, Syria, and Israel) and against Judah, ultimately absorbing these regions into the Neo-Babylonian empire. Nebuchadnezzar II sacked Jerusalem in 587 BCE and deported many of the city's elites to Babylon. After this, he captured Phoenicia and campaigned in Egypt, which he failed to take successfully. At its greatest extent, the Neo-Babylonian empire included all of Mesopotamia, southeastern Anatolia, Phoenicia, Syria, and Judah, from the Persian Gulf to the Mediterranean Sea. Furthermore, it secured the primacy of Babylon as the center

of Mesopotamian civilization, removing Nineveh as the political hub of the region, as it had been under the Assyrians for centuries.

Nebuchadnezzar initiated vast construction projects in an attempt to establish the primacy of Babylon as the renewed political center of Mesopotamia. Materials and wealth from the various territories were brought to Babylon to illustrate the cohesiveness of the Neo-Babylonian empire. Great temples, walls, and bridges were constructed to illustrate the grandeur of Babylonian rule. The construction of the Mede Wall between the Tigris and the Euphrates rivers, an attempt to prevent a potential invasion by their former allies, is also an example of a massive project undertaken under Nebuchadnezzar's rule. Most famously, the mythical Hanging Gardens of Babylon, made specifically for Nebuchadnezzar's Median wife Amytis, were supposedly constructed during his reign. The Hanging Gardens, as one of the Seven Wonders of the Ancient World, illustrate the reputation of Babylon as a center of wealth and power in the last powerful Mesopotamian-based empire.

Following Nebuchadnezzar's death, the Neo-Babylonian empire held together for a few more decades. Chaldean rule from Babylon bred discontent. Unlike the Assyrians before them, the Chaldeans did not have as powerful a hold on the provinces, whose inhabitants welcomed the invading Persians. According to ancient sources, when Cyrus the Great entered the city in 539 BCE, there was little resistance, and Chaldean power quietly fell, with the locus of power in Mesopotamia passing on to the Persians.

The Rise of Persia

The Persians emerged from the central Asian steppes in the late second millennium to settle in the Iranian plateau. They were one of several nomadic groups to migrate into the region,

RISE OF PERSIA

➤ CYRUS THE GREAT IN THE BIBLE

Persian emperor Cyrus the Great's accommodating foreign policy registered as compassionate and tolerant to many of his newly conquered populations, particularly the Israelites. In the book of Isaiah, Cyrus is regarded as anointed by God: "I am the Lord who says of Cyrus, 'He is my shepherd and will accomplish all that I please.'" Given that he ended the Babylonian captivity of the Jews and allowed for their return to Judah to reconstruct the temple, Cyrus is well regarded as a benign foreign leader, unlike the leaders of Assyria and Babylon.

—Abraham O. Mendoza

bringing with them military expertise gained from hunting skills honed on the steppe. In particular, they were known for being expert horsemen able to shoot arrows with accuracy. Along with the Medes, the Persians settled across the central plateau, forming a large state stretching from the Zagros Mountains in the west to the city of Tehran in the east. As they came into contact with the more sophisticated civilizations of the Neo-Assyrians and Neo-Babylonians in Mesopotamia, they gradually became involved in Mesopotamian affairs. Ultimately, the Persians would rule most of the Fertile Crescent, the Levant, and Egypt. They would come into contact with the Greeks in the west and with Indian civilization in the east, making theirs the largest land empire up to that time.

The Persians had a contentious relationship with the Mesopotamian empires, even while remaining peripheral to events within the Mesopotamian heartland. They fought against and paid tribute to both the Neo-Assyrians and the Neo-Babylonians. Cyrus the Great (r. 559–529 BCE) became Persian emperor and eventually conquered all of these regions and placed them under Persian hegemony. Cyrus united the Persians and defeated the Medes, incorporating their lands in eastern Anatolia (modern Turkey) into the Persian realm. In 564 BCE, the Persians defeated the Lydians in southwestern Anatolia and annexed their lands. By far, their greatest successes were the defeat of the Neo-

Babylonians and the Egyptians, which allowed the incorporation of these wealthy regions into the greater Persian empire. Cyrus demonstrated considerable compassion in the conquest of the Persian empire, as he did not use brutal force like the Assyrians, gaining sympathy among the conquered populations by allowing them to continue with their cultural and religious customs and incorporating them to a limited degree within the Persian bureaucracy of their own states.

The control over these vast domains, which were composed of multiple ethnic groups and cultures, posed a challenge to the administration of the Persian empire. Rather than force Persian customs on the conquered, the Persian administration allowed local cultures and languages to flourish under their hegemony. So long as the Persian king was honored and tribute was paid, regions were granted significant cultural autonomy (in terms of religion, language, and customs) as satrapies of the Persian empire. Unlike the Assyrians, who used brutal force to impose their will, the Persians ruled through the accommodation of regional interests. The Persian empire was divided into roughly 20 satrapies (provinces), ruled by intimates of the king and bureaucrats and officials who were under the watchful eye of the Persian military. Satraps (meaning "protector of the kingdom") served as governors, collected tribute, maintained stability, commanded troops, and raised military levies. Infrastructures, such as roads, were also developed as a means to promote trade throughout the Persian empire. Such roads provided efficient and rapid transit of military and government officials across the wide expanses of the empire.

The Persian empire eventually collapsed when it was conquered by Macedonian and Greek forces under the leadership of Alexander the Great in the late fourth century CE.

Seleucid Governance

The Seleucid political structure was modeled on the precedent that Alexander the Great had established upon his conquest of the former Achaemenid territories of the Levant, Mesopotamia, and Persia in the fourth century BCE. In essence, Seleucid governance was characterized by the pseudodeification of the monarch by the conquered populations (primarily the Persians), the acceptance of the satrapy (province) as a political subunit ruled by regional elites, and absolute control and loyalty of the military as the primary source of political legitimacy. The Seleucid monarchy relied on an extensive administrative bureaucracy staffed not only by the requisite Greeks and Macedonians (who considered themselves Greek), which characterized the upper echelons of Hellenistic rule, but also by non-Greek-assimilated elites steeped in the Greek language and culture. Seleucid control of vast regions of the former Achaemenid empire required that control be delegated to non-Greeks at the local level to prevent resistance to foreign rule. Nonetheless, the majority of the subject population did not consider themselves Greek and continued to practice their religion, language, and customs. In the case of the Persians and the Jews, this rejection of cultural hegemony created problems related to the authority of the Seleucid monarchy and the loss of territory.

Following the death of Alexander the Great in 323 BCE, disunity ensued in his vast dominions, which were divided by his generals into a series of dynastic kingdoms, all of which shared in the goal of spreading Hellenistic civilization in the Mediterranean littoral and western Asia. After a prolonged civil war with several other former generals who had served under Alexander, in 312 BCE Seleucus I established himself as the sovereign of the Seleucid empire, which encompassed the Levant, Mesopotamia, Persia, and areas of central Asia bordering on Mauryan India. As Alexander's successor to the Achaemenid empire, Seleucus fashioned himself as a Persian monarch, as had Alexander, to be revered and placed hierarchically above all other members of the realm. Unlike the Macedonian concept of kingship that merely placed the king as one of many elites, in Persia, kingship was defined by the status of the

➤ CATAPHRACTS

Among the many cultural elements that the Seleucids absorbed from their subject populations was the military formation known as the cataphract. The cataphract was a heavily armored cavalry unit that emerged from military practices used by nomads in the central Asian steppes. Cataphracts often served as shock battalions, and both soldier and horses were heavily clad to protect them from infantry attacks and other lesser-armed cavalry units. Greek armies encountered these formations in their campaigns east. The Seleucids adapted this form of military unit to use for their own armies. Cataphracts proved to be successful in battle against ancient armies and illustrate the diffusion of military tactics in antiquity.

—Abraham O. Mendoza

monarch as a semidivine leader with absolute rule, to which people had to prostrate themselves according to the hierarchical rituals of greeting known as *proskynesis*. While this proved to be a way to legitimize Greek rule to non-Greek elites, it did not quell dissent against what was seen as a foreign monarchy imposing its culture and authority over non-Greek peoples.

The Seleucids retained the Persian provincial unit or satrapy, which though nominally ruled by the Seleucids was administered at the local level by non-Greek elites. This gave the local administration a level of autonomy designed to prevent dissent and resistance to Greek rule. However, Seleucid rulers also founded cities and sponsored the spread of Greek culture and language in many of these newly conquered territories; non-Greek elites embraced Hellenistic culture, wishing to partake in Hellenistic civilization and the benefits of expanded trade and status that came with it. Inter marriage between Macedonians and Greeks with non-Greek elites formed a significant link to intertwine the different peoples who made up the Seleucid empire. The integration of these non-Greek elites into the Seleucid bureaucracy, trade networks, and other institutions created a cohesive stratum of society that was truly multiethnic and multicultural.

The Seleucid empire was vastly overextended and fraught by not only internal dissension but

also by external threats from its peripheral regions. In spite of its efforts to present itself as a successor to the ancient empires of Mesopotamia to its subject populations, albeit while propagating the benefits of Hellenistic civilization, the Seleucid political structure was overwhelmed by multiple problems. With its political center in Syria in Antioch, it faced the Mediterranean world, contending for power with rival Hellenistic states and the emergent Roman republic while attempting to retain a swath of central Asia amid the growing power of India and the emergence of various nomadic peoples who threatened its borders. Furthermore, internal resistance from Persians (Parthians) and Jews, who sought to break free from growing Seleucid authority in terms of culture and religion, eventually resulted in the loss of territory. Seleucid power would collapse due to both these centripetal and centrifugal forces and its inability to successfully retain its power over its subject populations. By 63 BCE when Roman general Pompey made Syria (which was by then the remaining territory of the former empire) into a Roman province, the Seleucid state was effectively obsolete.

The Ptolemies in Egypt

The short but spectacular career of Alexander II of Macedon (Alexander the Great) culminated in the overthrow of the great Persian empire including its province (satrapy) of Egypt. Alexander and his successors brought with them Greek culture and religion. These blended with the indigenous cultures of the Near East to create a rich civilization called Hellenism that lasted 1,000 years. Hellenism also came to Egypt but in a unique way.

After Alexander's death in 323 BCE, his successors divided the Near East among themselves. His friend and general Ptolemy received Egypt and Libya as his share. By 306 he had taken the title of king, and two years later he was crowned pharaoh at Memphis, Egypt's ancient capital. During his brief visit to Egypt in 332–331, Alexander had been acknowledged as divine ruler of Egypt by the oracle of the god Amun at Siwa in the Libyan desert, had been crowned at Memphis, and had selected the site and laid out the ground plan for the city of Alexandria on the Mediterranean at the mouth of the Canopic branch of the Nile delta.

Ptolemy I (305–282) built on Alexander's legacy. To authenticate his claim to kingship he married a daughter of Nectanebo II (360–343), the last native Egyptian pharaoh. Ptolemy I titled himself soter (savior) and made Alexandria his capital, which as a city would become the most magnificent in the eastern Mediterranean. In 322 he had kidnapped Alexander's body, brought it to Egypt, and interred it in a splendid tomb in Alexandria, the Sema, where the Ptolemies were also buried. Ptolemy I and his son, Ptolemy II Philadelphus (Lover of his Sister), built the Pharos, the lighthouse of Alexandria, one of the Seven Wonders of the ancient world. They founded the Museum as a center for intellectual and artistic life. Its library would ultimately contain 700,000 papyrus scrolls, the ancient equivalent of the holdings of the Library of Congress in Washington, D.C. Ptolemy I created the composite Hellenistic cult of the god Sarapis. The Apis bull, earthly manifestation of the god Ptah of Memphis, at death became identified with Osiris as Osiris-Apis/Sarapis. Ptolemy I combined this with aspects of the Greek gods Zeus, Apollo, and Asklepios to form a composite deity whose cult, linked to that of Isis, became popular in the Greco-Roman world. In Egypt itself the cult was confined to Alexandria. Manetho, a priest at Heliopolis, was invited to write a history of Egypt. Ptolemy I also invited Jews to settle in Alexandria, where they became the largest urban Jewish community in the eastern Mediterranean. In the reign of Ptolemy II the first major translation of the Jewish Torah took place from Hebrew into Greek, the spoken language of Alexandrine Jews.

► CLEOPATRA

Ironically, Cleopatra (VII), the last Ptolemy, became the most famous and fascinating. She is the subject of seven movies, portrayed among others by the silent movie star Theda Bara and by Claudette Colbert and Elizabeth Taylor. Cleopatra's profile on coins and her sculptures do not show a particularly beautiful woman but rather one of strong character. She had considerable charm, sexual allure, and political savvy, using all these qualities to keep Egypt peaceful and the Romans at bay. She was the only Ptolemy to speak Egyptian. When she met Julius Caesar, she entranced him and won his support for her monarchy. His association with Cleopatra and her opulent court was one of the factors in his assassination. Their son, Caesarion, was killed on the orders of Octavian. Following Caesar, Mark Anthony fell under her spell and married her, producing twins (a boy and a girl) and another son, none of whom would remain in Egypt. Returning to Alexandria after their defeat at Actium, Anthony, believing Cleopatra to be already dead, fell on his sword. He was taken to her and died in her arms. Later she too famously committed suicide, traditionally by the bite of an asp. Shakespeare wrote that any description of her beauty would be inadequate, "For her own person, it beggared all description" (*Anthony and Cleopatra* II/2).

—John Barclay Burns

Roman coin depicting Cleopatra VII Thea Philopator.
(Sandro Vannini/Corbis)

These actions demonstrate the form of both Ptolemaic rule and Hellenistic culture in Egypt. The Ptolemies prided themselves in their descent from the Macedonian royal family, whose mythic ancestor was Herakles. They and their courts continued to speak the local Macedonian dialect of Doric Greek. They married within their own family or with other Macedonian-descended royal houses such as the Seleucid in Syria. Beginning with Ptolemy II Philadelphus and Berenice, each king married his sister. This reflected the sibling marriages among the gods, both Greek and Egyptian; the divine status that the Ptolemaic dynasty accorded itself; and Ancient Egyptian practice, the latter not as common as is popularly supposed. The Greeks in Egypt tended to remain in Alexandria, creating an inward-looking cultural and religious enclave while coexisting with the native culture 3,000

years old. This effectively meant that there were two cultures living side by side, occasionally amicably but more often in mutual distrust and hostility. The Ptolemies created a royal court that became notorious for *tryphē*, a Greek word for decadent luxury. The abundant resources of Egypt provided the means to support this and also Ptolemaic political and military ambitions in the eastern Mediterranean.

In theory, the entire land of Egypt was owned by the royal family. In reality, temples were still significant landowners; gifts of land were made, and veterans of the Ptolemaic armies received plots. Greek proprietors often rented their estates to Egyptians to work and thus produce the necessary taxes. During Persian rule some coins had been minted and used, but the Ptolemies introduced a regular monetary economy to Egypt. Greeks were heavily dependent

on the native Egyptians for their understanding of Egypt's agriculture, irrigation, and animal husbandry. Despite this dependence, native tenant farmers and peasants were subject to heavy taxation and were exploited by an often corrupt bureaucracy. The dynasty and its administration were Macedonian Greek, and Greeks were needed to staff it, especially at its upper levels. There had been a Greek presence in Egypt for several centuries. Necho II (Twenty-sixth Dynasty, 610–595) brought in Ionian Greeks to form an Egyptian Navy. In 570, the pharaoh Ahmose II had granted trading rights to foreigners, mostly Greeks, at the port of Naucratis in the Delta. However, Greeks suitable for government were always in short supply. As a result, Egyptians did enter the government but rarely reached the highest levels.

As it had done for millennia, their ancient religion continued to provide the Egyptians with focus and support for their cultural identity. Temples and priests remained important in their lives. Whatever their motives, the Ptolemaic rulers presented themselves as true Egyptian pharaohs, appearing on temple walls in traditional royal garb, offering to the gods, and taking their rightful place in the divine and mythic order. From the reign of Ptolemy II Philadelphus, kings and their wives were gods united, like the Ancient Egyptian pharaohs, with their dead predecessors who had “become Osiris.” The living ruler was still Horus. Beginning with Ptolemy I Soter, the dynastic rulers built and endowed temples and supported their priests on a grand scale. The high priests of the god Ptah at Memphis usually held considerable influence at the royal court. The famous Rosetta Stone, whose discovery in 1799 CE led to the deciphering of the hieroglyphic script, is a record of gifts, privileges, and tax exemptions granted by Ptolemy VI Epiphanes (God Manifest) in 196 to the Egyptian clergy to gain their support. The most-visited and best-preserved temples in Egypt come from the Ptolemaic era: those of Horus at Edfu, Isis at Philae (now on Agilkia), Hathor at Dendera, and the double shrine of Haroeris (Great Horus) and the crocodile god Sobek at Kom Ombo.

The Ptolemaic empire reached its greatest extent in the reigns of Ptolemy III and IV (246–

205 BCE) and included Nubia, Libya, and Syria-Palestine. Although Egypt continued to prosper during the reigns of Ptolemy V Epiphanes and Ptolemy VI Philmetor (205–145), possessions around the Mediterranean such as Syria-Palestine were gradually lost. The last century of the Ptolemaic dynasty was characterized by bitter family rivalries and plots that regularly led to assassinations and the increasing power of Rome in the eastern Mediterranean. In 51 BCE, Cleopatra VII became pharaoh and married her older brother Ptolemy XIII; she was only 17 years old. Ptolemy XIII died attacking Julius Caesar when he arrived in Egypt in 48. Caesar was captivated by Cleopatra and confirmed her rule alongside her younger brother Ptolemy XIV. She also made her son by Caesar, Ptolemy XV Caesarion, ruler in 36. After Caesar's assassination, she entered into an alliance with and then married Mark Anthony. At the naval Battle of Actium in 31, Anthony and Cleopatra lost to Caesar's adopted son Octavian. They fled back to Egypt. In August 30, Cleopatra committed suicide rather than end up in Octavian's triumphal parade in Rome. The era of the Ptolemies in Egypt was over.

Cleopatra and the End of Ptolemaic Egypt

The decline of the Hellenistic kingdoms vis-à-vis the Roman republic in the second and first centuries BCE left Ptolemaic Egypt as the last independent kingdom in the Mediterranean littoral. The Seleucid empire, Macedonia, and most all the Greek city-states and independent kingdoms had

succumbed to Roman authority, either as client-kingsdoms or directly held Roman provinces. In spite of these developments, Ptolemaic Egypt retained its independence, albeit while facing a long-term economic and political decline. Internal dissent on the part of non-Greek Egyptians, the loss of Cyprus and other provinces, and the contentious dynastic disputes during this time contributed to this decline. Most importantly, the last Ptolemaic ruler, Cleopatra VII Philopator, in the process of entangling herself in Roman politics through her liaisons with Julius Caesar and Mark Antony, ensured the destruction of Ptolemaic independence in 30 BCE at the hands of Octavian (the future Roman emperor Augustus Caesar), who saw her as a threat to his power in the Mediterranean region.

Prior to Cleopatra VII's accession to power, the reign of her father Ptolemy XII had been a period of significant decline. Ptolemy XII's attempt to centralize his authority led to dissent among the non-Greek populations and the loss of Cyprus and Cyrenaica. Corruption in the administration and the exploitative taxes demanded of the mass of the non-Greek Egyptian population for the past century had proved to be detrimental to the Ptolemaic dynasty. Upon Ptolemy XII's death in 51 BCE, Cleopatra was made comonarch with her brother and husband Ptolemy XIII. While Egypt was engulfed by economic crises, floods, and famine, Cleopatra conspired against her husband, which resulted in her exile from Egypt in 48 BCE as he became sole ruler.

Ptolemy XIII became embroiled in Roman affairs during the Roman Civil War of 49–45 BCE. When Roman consul Pompey sought sanctuary in Alexandria, he was captured and beheaded in 48 BCE. Ptolemy believed that this gesture would win him the gratitude of Julius Caesar. Caesar, while Pompey's rival in the conflagration, nevertheless was upset by the situation and seized Alexandria, making himself the arbiter between Ptolemy and Cleopatra. Cleopatra sought to gain Caesar's favor and managed to charm him in their first meeting, and they became lovers. Caesar backed Cleopatra's claims to the throne, reinstating her along with her new brother-husband Ptolemy XIV as comonarch. In 44 BCE Caesar was murdered in Rome. Cleopa-

➤ PTOLEMAIC ADOPTION OF EGYPTIAN KINGSHIP TRADITIONS

The Ptolemaic dynasty of Egypt, which ruled from 305 to 30 BCE, was essentially a Hellenistic Macedonian family, descended from one of Alexander the Great's top generals. However, the founder of this dynasty, Ptolemy I Soter, recognized, much as had his predecessor Alexander, that by adopting the non-Greek native traditions of kingship of the newly conquered territories of the East he could legitimize his rule more efficiently and diminish dissent and resentment against foreign rule. He presented himself as Pharaoh to his newly conquered subjects after he centralized his control of Egypt in the wars of succession. He also introduced certain traditions to his dynasty that would legitimize them to the non-Greek populations, such as incestuous marriage practices and claiming the status of deities. While retaining Greek language and culture at court, the Ptolemies simultaneously continued Egyptian traditions to secure their rule and appease the non-Greek Egyptians. From Ptolemy I Soter to Cleopatra VII Philopator, the Ptolemies continued these traditions, thereby illustrating the hybrid nature of Hellenistic civilization in the ancient Near East.

—Abraham O. Mendoza

tra, who had born Caesar a son, Caesarion, made Caesarion her coregent and successor to the Egyptian throne upon the death of her husband Ptolemy XIV. In the midst of a minor civil war, Ptolemy XIV drowned in the Nile River in 43 BCE, thereby removing him as a potential rival and ending all internal hostilities.

Mark Antony, one of the triumvirs (one of three who rule) of Rome in the aftermath of civil war, met with Cleopatra in 42 BCE. Mark Antony and Cleopatra fell in love and had multiple children. After spending several years in the East fighting in campaigns against the Parthians, Mark Antony settled in Alexandria. Most of his conquered territories in the East were given to his three children with Cleopatra (Alexander Helios, Cleopatra Selene II, and Ptolemy Philadelphus) in 34 BCE. Caesar's successor, Octavian, who was also in the triumvirate with Mark

Antony, along with most of the Roman Senate was outraged by Mark Antony's actions. Octavian persuaded the Senate to declare war against Ptolemaic Egypt. At the Battle of Actium in 31 BCE off the Ionian coast of Greece, Mark Antony and Cleopatra's fleets were destroyed by Octavian's forces. As Octavian's force entered Egypt, Mark Antony's legions deserted, thereby leaving Mark Antony and Cleopatra. Both Mark Antony and Cleopatra committed suicide rather than face Octavian's wrath, with Egypt subsequently falling to Roman rule in 30 BCE. As the last of

the independent Hellenistic kingdoms, this event marked the end of the Hellenistic era.

■ Introduction: The Kingdoms of Syria-Palestine

For modern Jews, Christians, and Muslims, the political history of Syria-Palestine from 1000 BCE to 300 CE is of profound importance. This is the location and period in which most biblical events are said to have occurred. Much of the Old Testament/Hebrew Bible explicitly recounts the political history of the kingdoms located in this small but important region.

The Old Testament describes the rise and fall of a number of Iron Age states within the region. The kingdoms of Israel and Judah are of most interest to the biblical authors; however, they also discuss Philistia (on the coast of Israel) and a number of kingdoms in what is now known as Jordan. The Old Testament also attests to relations between the kingdoms of Israel and Judah with the Phoenicians (in what is now Lebanon) and other polities in Syria.

Most of the kingdoms of the Levant had lost their autonomy by 586 BCE, having been conquered by first the Assyrians and then the Babylonians. When the Babylonians were conquered by the Persians, many of these states were incorporated into the larger Persian empire until Alexander the Great defeated the Persians in 332 BCE. Then this region fell under his control. Alexander the Great brought Hellenistic-Greek culture and political institutions to the region. When Alexander died, the Levantine portion of his kingdom fell under the control of the Seleucid dynasty. After numerous powers within the

region rose and fell, the Romans incorporated it directly into their empire.

—Kevin M. McGeough

The United Monarchy of Saul, David, and Solomon

According to the Old Testament, the tenth century BCE saw the emergence of the first kingdom of Israel. The books of Samuel and Kings (and a later account in Chronicles) describes the movement of Israel from a decentralized polity with an ad hoc system of leadership to the formation of a structured hierarchical state analogous with those of surrounding states. In the biblical tradition, Israel was ruled by judges, who are best thought of as temporary rulers as opposed to the judicial meaning that is implied by the word today.

A judge would arise in a situation of crisis, and once the crisis was resolved, the leadership structures disappeared. In the biblical tradition, this system eventually became unsatisfactory to the people of Israel, who requested that one of these temporary leaders, the prophet Samuel, provide them a king like the other nations had. According to the Bible, God agrees to provide the people with a king and, using Samuel as an intermediary, chooses Saul. Saul reigns briefly but falls out of favor with God, while at the same time a young shepherd boy named David finds favor with God. Eventually David supplants Saul as king and has a long and successful reign. The biblical stories of David are interesting since they do not always portray him in a favorable light. When David dies, his son Solomon becomes king. According to the Bible, Israel under Solomon expands its territory and becomes an economic powerhouse in the region. According to the biblical text, though, Solomon's most important achievement is the construction of the Temple in Jerusalem for which he enlists the help of Phoenician architects. After Solomon's death, the people in the north revolt and form an independent state. From this point on (in what is referred to as the Divided Monarchy), the northern kingdom is known as Israel, and the southern kingdom, which retains Jerusalem as its capital, is known as Judah.

ANTIMONARCHICAL SENTIMENTS IN THE BOOKS OF SAMUEL

Scholars and close readers of the Old Testament have noticed two seemingly disparate attitudes toward kingship in the books of Samuel. There are seemingly promonarchical sentiments in which the development of kingship is seen as a type of progress. Most importantly, a king will help provide Israel with security against her enemies. But even though God grants the people a king, there are some very clearly negative sentiments regarding kingship in the Bible. Perhaps the strongest example of this is 1 Samuel 8:7 in which God explains to Samuel that the people's request for a king is tantamount to a rejection of God. Samuel, the prophet through whom God is said to have implemented the institution of kingship, seems unenthused for it. Samuel warns the people of the negative consequences of kingship (especially taxation and conscription) and foresees a day in which they will regret the choice.

Bibliography

Dietrich, Walter. *The Early Monarchy in Israel: The Tenth Century B.C.E.* Translated by J. Vette. Biblical Encyclopedia. Atlanta: Society of Biblical Literature, 2007.

This period of the United Monarchy is referred to in archaeological periodization as the Iron IIa period (1000–925 BCE). There is considerable disagreement among scholars regarding the veracity of the biblical account. Scholars who feel that the biblical account is wholly reliable are maximalists, whereas those who do not trust the account at all are known as minimalists. Most mainstream scholars fall somewhere between the two, but there is considerable variation among scholars regarding which elements of the biblical account reflect historically accurate data and which do not. This problem is magnified by the fact that the biblical account of the United Monarchy is highly literary and was not meant to serve as a historical account in the way in which historians write today.

One of the key problems in the debate regarding the historicity of the United Monarchy

lies in the lack of external corroboration. For the later kings of Israel and Judah, the historical accounts of the Assyrians and others attest to the general accuracy of the presentation of the order of kings in the Old Testament (with a few minor problems). There is only one strong piece of external evidence for any of the figures of the United Monarchy: an inscription that dates to the Iron IIb period (after the presumed time of the United Monarchy) found at Tell Dan. The Dan inscription refers to the “house of David,” which proves that in slightly later times people believed that a man named David had founded the dynastic line that ruled Israel.

Archaeological evidence is much more open to interpretation regarding the historicity of Saul, David, and Solomon. Without an inscription that labels that a building was built by one of these figures, it is difficult to safely attribute these structures. However, one biblical passage, 1 Kings 9:15, provides a possible evidentiary basis for attributing certain buildings with Solomonic construction projects. The passage reads: “Now this is the account of the forced labor that King Solomon conscripted to build the house of the Lord (the Temple) and his house, the Millo, and the wall of Jerusalem, Hazor, Megiddo, Gezer.” Excavations at Gezer, Megiddo, and Hazor as well as some excavations at Jerusalem have revealed similar architecture that is best understood as part of a centralized royal building project. However, some scholars have recently argued that these structures have been misdated and that they should in fact be associated with the construction projects of the later Omride dynasty of the Iron IIb period.

Kingdom of Israel

The Kingdom of Israel emerged as a separate political entity from the Kingdom of Judah circa 930 BCE, a period in biblical history known as the Divided Monarchy through which the Kingdom of Israel lasted well until circa 722 BCE when conquered by the Assyrians. According to the biblical accounts, upon the death of King Solomon (ca. 930), his son Rehoboam succeeded him and traveled to the northern territories of the realm to lay claim to his father's dominions. However, northern tribal leaders attempted to negotiate with him over high taxation and forced labor policies that had been instated by his father. Much of this labor was conscripted from non-Hebrew populations, but these peoples affected the livelihoods of northern Hebrews in terms of subjecting them to economic control emanating from the House of David in Jerusalem. Rehoboam found himself at odds with the tribal leaders' demands; he refused to accede to their demands and attempted to impose more stringent labor policies. In the aftermath, Rehoboam's official Adoram, sent north to enforce Rehoboam's labor conscription policy, was stoned to death by rebellious Israelites. Rehoboam was forced to return to Jerusalem, which resulted in the de facto separation of the kingdoms.

Biblical tradition further asserts that Jeroboam became king of Israel after formerly having served Solomon as an administrator of corvée labor in the north and then having fled to Egypt after treasonous activity against the Monarchy. Upon Solomon's death Jeroboam returned to Israel and was a key figure in the secession of Israel from Rehoboam's realms. Jeroboam established religious centers at the cities of Dan and Bethel in an effort to dissuade Israelites from making pilgrimages to Jerusalem. He was apprehensive that if this continued, Israelites would reestablish their loyalty to Rehoboam. However, this was a violation of Deuteronomistic law and as such is depicted in the Bible as a major of-

fense to the Hebrew religion. The historicity of these events have come into question by scholars since much of this account reflects the values of a later time period.

Whatever its origins, the first century of the Divided Monarchy was fraught by endemic warfare between Israel and Judah. The political center of Israel at Tirzah became a rival to Jerusalem for the loyalty of Hebrews in both realms. However, Israel attempted to persuade its neighbors to join in the struggle against steadfast Judah, thereby bringing Philistia and Damascus into its foreign policy adventures. Judah followed suit by also offering tribute and territorial concessions for viable alliance against Israel. As a result, these intrigues between Israel and Judah allowed Damascus to extend its dominion along the coast and thereby secure its own territorial expansion vis-à-vis the western regions of Canaan.

Israel's emergence as an important center of trade in the Mediterranean and the Near East occurred in the reign of Omri (ca. 883–872 BCE). Omri successfully secured his power by creating a stable dynasty and founding the new capital of Israel in Samaria. In establishing this new capital, Omri ensured better communication and trade networks with the Phoenician cities, particularly Tyre. Phoenicia benefited from stable relations with Israel to ensure inland access to trade networks for its Mediterranean mercantile enterprises. This commercial relationship benefitted both Israel and Phoenicia but brought Israel into conflict with Damascus over control of trade routes. However, these rivals would put aside their differences to meet their common enemy, Assyria.

Assyrian rise to hegemony in the region brought it into conflict with the coastal regions of the Fertile Crescent. Ahab, Omri's successor, found it expedient to form an alliance with Damascus to counter this growing threat emanating from northern Mesopotamia. Assyrian kings gave their potential adversaries two options: pay them tribute or face destruction. In the mid-ninth century BCE, Israel and Damascus formed a coalition with other polities in the coastal regions of the Levant to counter the advance of Assyrian forces under Shalmaneser II. While Assyrians were successful at engaging this coalition in a series of confrontations, they also indi-

rectly assisted the growing strength of Damascus, which became the hegemonic power in the region in spite of coalition defeats. As a result, Israel was subjected to domination from Damascus. An unsuccessful revolt by King Jehu (ca. 841 BCE) against anti-Assyrian factions (which meant pro-Damascus cadres) in effect led to more direct influence from Damascus when this revolt was crushed. King Hazael of Damascus annexed various regions from Israel and added these to his own kingdom, thereby enhancing his control over Israelite affairs.

In the early eighth century, Israel managed to survive by pitting Damascus and Assyria against each other while maintaining peaceful relations with Damascus and paying heavy tribute to

Assyria. However, late in the eighth century, as Damascus's power began to wane, Israel asserted itself militarily. It managed to regain many of its former territories and also reestablish its commercial prosperity in the region. By the mid-eighth century BCE the situation was reversed, and Damascus was subservient to Israel and reliant on Israel for its own security. However, with the reassertion of Assyrian military expansion in the late eighth century, Israel faced this threat mostly on its own.

Israel recognized its position of weakness with regard to the Assyrian threat and thus secured its stability by serving as a loyal vassal. However, under the reign of Hoshea (732–724 BCE), Israel conspired with Egypt against Assyria and withheld tribute, which led to an Assyrian siege of Samaria (725/724 BCE). Assyrian kings Shalmaneser V and Sargon II campaigned in the Levant against Israel, Phoenicia, Damascus, and Egypt, effectively destroying their military forces and absorbing their territories. It was during this period that the mass deportations of Israelite captives to Assyria proper began. The Kingdom of Israel was effectively dismembered and defunct by circa 722 BCE. Judah managed to stave off conquest and destruction by paying heavy tribute to the Assyrian forces.

Kingdom of Judah

According to biblical tradition, the dissolution of the Kingdom of Israel under the House of David resulted in the formation of the two kingdoms of Israel and Judah in what is known as the Divided

Monarchy. Upon the death of Solomon in circa 930 BCE, his son Rehoboam asserted his claim to the throne in Jerusalem and subsequently went northward to ensure his control of the northern territories. However, he was unable to affirm his control of these territories, given the resentment against his father's forced labor policies by northern leaders. His reluctance to withdraw his father's labor policies enraged the leadership of the northern tribes. This resulted in the secession of the northern territories, which coalesced into the Kingdom of Israel under King Jeroboam. The rump state that remained, centered in the city of Jerusalem, became the Kingdom of Judah. Recently, scholars have come to question the historicity of the biblical accounts of the United Monarchy, although no clear consensus on this issue has been reached.

Regardless of its historical origins, Judah became a pivotal region for trade in the Levant during the Iron IIB period due to its position in relation to Egypt in the south, which ensured trade and commercial networks in the eastern Mediterranean. However, it was effectively cut off from the inland trade networks that Israel possessed. Nonetheless, Judah retained its autonomy from Israel, regardless of the attempts of the latter to subjugate it. Much of the early period of the Divided Monarchy is characterized by constant warfare between Israel and Judah. As a consequence, King Asa of Judah (ca. 911–870 BCE) plotted against Israel by securing an alliance with its adjacent regional rival Damascus. By ensuring Damascus through tribute of its loyalty, Judah ensured that Damascus would effectively prevent Israelite forces from attacking its northern border. However, the emergence of Assyria led to Israel and Damascus finding a mutual cause in terms of having a common enemy and thereby ended mutual hostilities, effectively isolating Judah. In turn, Judah had to recognize Israel's hegemony and its own subservience.

During the reign of King Jeroram (ca. 846–841 BCE), Judah became further subjected to Israel due to pressure exerted by Assyria in the region and the coalition formed by regional powers in combating Assyrian expansion. Judah's alliance with Israel also resulted in Judah becoming entwined in Israel's domestic political disputes

and foreign wars. Intermarriage between the royal houses, while ensuring a solid alliance (more likely suggesting a marriage of convenience both literally and figuratively), did not mean a union of the kingdoms. Damascus eventually established its own hegemony over the region, and both Israel and Judah were subjected to its indirect political domination from the 830s BCE to the early eighth century BCE.

The resurgence of Assyrian military power in the early eighth century contributed to the waning of the power of Damascus. This resulted in a relative restoration of Judah's autonomy in the region. The dissolution of the anti-Assyrian coalition also resulted in a rift between Israel and Judah. King Joash of Israel laid siege to Jerusalem after King Amaziah of Judah overreached his forces and tried to assert his power in the region, believing that Israelite forces were engaged with Damascus. By 783 BCE, Judah was again subservient to Israel's domination in the region. Nonetheless, Judah was able to assert itself in the region regardless of Israel's domination, particularly against weaker enemies. During the reign of King Azariah (ca. 783–732 BCE), Judah was able to defeat Philistine and Arab forces and ensure its control over important trade routes to the Hejaz.

Resurgent Assyrian power contributed to the destruction of the Kingdom of Israel by 722 BCE, leaving only Judah as an autonomous yet subservient kingdom to the Assyrian empire. With the fall of Samaria and the establishment of Assyrian power in the Levant, Judah was forced to pay tribute to its Assyrian overlords in order to ensure its survival. While initial resistance against Assyria, such as King Hezekiah's revolt, led to the invasion of Judah by Assyrian forces, Assyria's siege of Jerusalem and other important Judean cities failed due to stiff resistance by Judah's forces and Hezekiah's leadership (ca. 727–697 BCE). As a result, Judah retained its status as a vassal state of Assyria but did not suffer the same fate as Israel, which had been dismembered and had much of its population deported.

Conflict between Egypt and Assyria in the seventh century directly involved Judah as it sought to wrest itself from indirect foreign domination. The gradual decline of Assyria allowed Judah to assert itself as an independent polity

and to acquire lands from the former Kingdom of Israel. However, as the Assyrian empire succumbed to its enemies in Mesopotamia, most notably the Neo-Babylonians and the Medes, Judah also felt the pressure exerted by these forces. While Judah paid tribute to Babylon during its expansion in the region vis-à-vis Egypt, it also secured an alliance with local states in the Levant also apprehensive about Babylonian power.

Judah's policies of assuaging the Babylonians of their loyalty and simultaneously attempting to counter their power by forming an alliance was eventually ended when King Zedekiah (r. 597–586 BCE) led a revolt against Neo-Babylonian forces in an attempt to ensure Egypt of its

support. However, this elicited a harsh response from Neo-Babylonian king Nebuchadnezzar, who laid siege to Jerusalem and ordered the destruction of the Temple in 586 BCE. Furthermore, this also led to the Babylonian captivity of Judean elites, who were deported to Babylon, while Judah came under the direct control of Babylon.

Judah under the Persians

In 538 BCE, a decree by Cyrus of Persia, attested in archaeological and biblical sources, granted the Judean exiles permission to return to Jerusalem and rebuild their Temple. Though many remained in Babylonia forming the nucleus of a Jewish Diaspora in the east, many others returned. The Second Temple was completed between 521 and 515 BCE, an event seen by many as fulfilling the words of the prophet Jeremiah, who had predicted an end to the exile after seventy years (2 Chronicles 36:22). There was great friction, however, between the Jews who had remained in Judea at the time of the exile and the returning exiles who, though few in number, enjoyed imperial support. These self-styled “children of the exile” referred to the local Judeans as “peoples of the land”—a derogatory term that questioned the latter’s very status as Jews. Conflicts over Jewish identity and the boundaries of the Judean community were bitter during this period.

In keeping with their policy of creating stability through local, religious, and legal reform, later Persian emperors promoted the establishment of the Torah as the authorized law of the

Jews. This task is associated with two figures whose chronological sequence is uncertain—Ezra and Nehemiah. Ezra, a Babylonian Jew from a priestly family described as a scribe expert in the Torah of Moses, was commissioned by the Persian emperor to supervise the Temple, establish the Torah of Moses in the Judean province, appoint scribes and judges, and administer civil and moral order. As the Persian-appointed governor of Yehud, Nehemiah instituted a number of economic and social reforms.

According to the biblical books that bear their names, Ezra and Nehemiah sought to regulate and unify Jewish life in the Restoration community. They instituted some radical reforms aimed at strengthening the religious identity of the Judahites and preventing the decline of exclusive Yahwism by enforcing a policy of social and religious separatism. Their most radical act was the dissolution of foreign marriages and insistence on a genealogical standard for Jewish identity. Ezra objected to marriages between the returning exiles and the “peoples of the land”—foreigners, but possibly also Judeans who had remained in the land during the exile and who, according to the book of Ezra, had adopted many of the customs and religious practices of their neighbors. He described these unions as a great sin and called upon the exiles to divorce their foreign spouses and expel from the community children born of such unions. The prohibition of intermarriage with any foreigner and the refusal to assimilate foreigners within the community was an innovation on Ezra’s part. The Torah prohibits marriage with certain, but not all, foreigners and in any event allows for the assimilation of, and marriage to, foreigners who renounce idolatry and agree to the terms of Israel’s covenant with Yahweh.

Ezra called a public assembly to present an extended public reading of, and communal rededication to, the Torah of Moses—which probably consisted of something like the Deuteronomic and priestly traditions. The biblical account describes the pledge of all the people who “join with their noble brothers, and take an oath with sanctions to follow the Teaching of God, given through Moses the servant of God, and to observe carefully all the commandments of the Lord our God, His rules and laws” (Nehemiah

► THE HISTORICITY OF EZRA

The historicity of Ezra has evoked controversies as deep as those surrounding the figure of Moses, to whom Ezra is often compared because of his putative role in reconstructing a postexilic Jewish community in Palestine. Some scholars consider Ezra to be the invention of the Maccabean era, while others read the biblical books of Ezra and Nehemiah as the later elaboration of a basically historical tradition. The matter is further complicated by chronological problems in the sources that make it impossible to date Ezra with certainty. He appears to have some connection with Nehemiah, the governor of Judah in the fifth century, but whether he preceded or followed Nehemiah (465–425 BCE or 405–359 BCE are the common alternatives) is not clear. Ezra is described as both a priest and a

scribe, expert in the Torah of Moses. Evidently, a man of some importance in Babylon, he assumed some sort of leadership role in the Jewish community in Jerusalem. To what degree he was a Persian functionary is debatable but his mission appears to have been the teaching and implementation of the Torah of Moses. Since the books of Ezra and Nehemiah contain references to a wide range of Pentateuchal traditions, it is thought that Ezra's "Torah of Moses" was much like the Pentateuch we currently possess. Ezra is particularly identified with efforts to quash intermarriage. In rabbinic tradition, Ezra is praised for rebuilding Judaism. It is said that he would have been worthy of receiving the Torah from God, had Moses not preceded him.

—Christine Elizabeth Hayes

10:30). There then follows a long list of obligations to which the people commit themselves. Significantly, the ban on intermarriage and the observance of the Sabbath top the list as central covenantal obligations.

Many scholars believe that this was the moment when the Torah, backed by Persian imperial power, became the official and authoritative norm for Israel. In this period, Judaism took the decisive step toward becoming a religion of Scripture. The zeal of Ezra and Nehemiah with the sponsorship of the Persian imperial authority, helped to preserve—or more properly, create—a national and religious identity for Jews at a time when their numbers were small and they were surrounded by enemies.

However, the reforms of Ezra and Nehemiah met with resistance, as evidenced in various postexilic sources that protest the policy of extreme separatism, and the bans on intermarriage and conversion. Isaiah 56:1–7 reassures foreigners who have joined themselves to God that they will be welcome in the holy Temple to worship and offer sacrifices. The postexilic book of Ruth is the story of a foreign woman who chooses to join the community of Israel. Welcomed by those who know of her righteous and compassionate deeds, Ruth will become the great-grandmother of Israel's most famous and beloved king David. One cannot imagine a story standing in greater con-

trast to Ezra's policy of separatism and nonassimilation of foreigners than the book of Ruth. The assimilation of foreigners at this time was widely viewed as possible, and we have much evidence that non-Jews became Jews and that Jews felt no compunction about marrying them, despite Ezra's campaign to the contrary. For example, the powerful and influential Tobiads were originally Ammonite, but adopted Jewish identity and were fully assimilated by the Ptolemaic period.

The Torah of Moses may have become the unchallenged norm and source of authority for Jews in the Persian period, but this did not in itself result in a uniform or monolithic set of Jewish practices and beliefs. It simply meant that practices and beliefs were perceived as authentic to the degree that Scriptural warrant could be found for them. Various techniques of scriptural interpretation arose, enabling widely divergent Jewish groups to claim authenticity for their practices and beliefs. The Second Temple period spawns a variety of Jewish subgroups—Pharisees, Sadducees, Essenes, and more—each claiming scriptural or divine authority for its interpretation of the common heritage of the nation. Thus, although Ezra succeeded in unifying Israel around a common text, he did not succeed in unifying Israel around a common interpretation of that text.

Hellenistic Palestine

Alexander of Macedon's conquest of the Ancient Near East was concluded in the 320s BCE. In Alexander's time tens of thousands of Greeks and Macedonians migrated to all parts of his vast empire. Greek culture flourished from Italy to Central Asia until the rise of Islam in the seventh century. In political terms, the Hellenistic period in Palestine extends from 332 to 167 BCE, when the Jews asserted their political independence from the Greeks. In cultural terms, however, the Hellenistic period in Palestine extends until the rise of Islam, for even under native Jewish rule, Roman rule and later Byzantine rule, Jews in Palestine were thoroughly immersed in Hellenistic culture.

Rulers of the Hellenistic period encouraged the construction of new cities and the conversion of old cities into towns with Greek institutions such as: the assembly of citizens, the election of magistrates, educational athletic centers (the gymnasium), and civic cults honoring the Olympian gods as well as local deities. In addition, there was a wide adoption of the Greek language, of Greek dress, material culture, art, and modes of thought particularly among the upper middle classes of the Ancient Near East. That Jews participated in and were deeply influenced by Hellenistic culture is attested in an array of writings expressing new ideas, and in the formation of sectarian movements with diverse understandings of God's will for Israel: Sadducees, Pharisees, Essenes, and messianic and apocalyptic movements.

After Alexander's death in 324, his generals fought for control of the empire. By 301 Egypt was held by Ptolemy, while Mesopotamia and the Levant (Palestine) were held by Seleucus. However, the Ptolemies occupied most of the Levant and for a century the two great powers struggled for control of the region, the Seleucids finally prevailing by 198 BCE.

The struggle had a significant impact on the internal politics of Jerusalem and Judah, with pro-Ptolemaic and pro-Seleucid factions in conflict. After gaining control of Judea in 198, the Seleucids rewarded the pro-Seleucid faction by providing support for the Temple, granting tax concessions, and confirming local autonomy. But the early second century BCE saw a struggle over the office of high priest in which various contenders for the position paid the Seleucid king, Antiochus Epiphanes, for his support. Problems arose when a man named Menelaus attempted to raise money to buy the king's support by taking treasures from the Temple. Fighting broke out between the supporters of Menelaus and a certain Jason, who favored establishing Jerusalem as a polis. Antiochus suspected a revolt, recaptured the city, and plundered the Temple in 169–168 BCE. He garrisoned troops in Jerusalem and reorganized the Temple under pagan rites to accommodate his soldiers. The Temple was rededicated to Zeus Olympius (the Syrian god Baal Shamem) and Menelaus presided as high priest over the proceedings. Many Jews were outraged however, and the suppression of traditional Jewish observances, such as circumcision and Sabbath observance, prompted a full-scale revolt known as the Maccabean Revolt.

The Maccabean Revolt was led by Judas Maccabeus of the Hasmonean family, and his sons. Among the rebels were Hasidim or "pious ones," whose goal was to purge the Temple of its "pagan pollution" and restore it to Yahweh. This was achieved in December, 164 BCE—an event commemorated by Jews to this day in the Festival of Hanukkah. During the revolt many zealots were tortured and killed, generating the first written accounts of Jewish martyrs, that is, persons who willingly accept death rather than violate the injunctions of their religion against, for example, eating pork or offering sacrifice to the king's god.

► PHILO OF ALEXANDRIA

Philo Judaeus was a Jewish philosopher from Alexandria (ca. 20 BCE–50 CE). He was born into a noble family with connections to the Herodian dynasty, but little is known of his life. It is evident from his knowledge of classical literature, philosophy, rhetoric, and general science that he received training well beyond the Greek general education of the encycia (literature, rhetoric, mathematics, music, and logic). His writings display an excellent command of Greek language and literary style. The source of his Jewish knowledge is less clear and it is thought that he did not know Hebrew, but read the Tanakh in its Greek translation (the Septuagint). He apparently attended Sabbath synagogue services and occasionally consulted learned members of the community about aggadic traditions. He undertook a pilgrimage to Jerusalem once in his life. Philo was a devout Jew who nevertheless took an active part in the social life of Alexandria, attending the theater, horse races, and banquets of the city. Following a series of anti-Jewish pogroms in Alexandria in 38 CE, Philo headed a delegation of the Alexandrian Jewish community to emperor Caligula in Rome (40 CE). Although the mission failed, the increasing unrest was settled by Claudius who ascended the throne in 41 CE.

Philo's writings may be divided into three general categories. The first consists of expositions of the Pentateuch as a legal code. In addition to biographies of biblical characters (the patriarchs, Moses) Philo wrote an exposition of the biblical commandments, classifying them under the various commandments of the Decalogue. The second category of works consists of philosophical interpretations of the Pentateuch. These works are allegorical treatments that ignore the plain narrative content of the Tanakh, reading it instead as a system of abstract philosophical-mystical concepts. The third category of writings consists of commentaries on Genesis and Exodus presented in a question and answer format. Philo also wrote treatises devoted to purely philosophical topics, as well as contemporary historical books. His works are strongly influenced by Stoicism, Platonism, and neo-Pythagoreanism.

Philo's writings were preserved by the Christian Church, some in Greek and some in Armenian translation. No Jewish source (other than Josephus) refers to Philo explicitly. While his influence on rabbinic Judaism was negligible, his influence on the Church Fathers was great because of his systematic allegorical readings of the Hebrew Bible.

—Christine Elizabeth Hayes

The Hasidim, concerned only about the pure worship of Yahweh and not about national independence, broke with the Hasmoneans once it was clear that the latter were bent on the further goal of national independence. Though they lost the support of the Hasidim, the Hasmoneans met with military success, assisted in their efforts by a mutual defense treaty with Rome. In 142 BCE, independence from the Seleucids and expulsion of their army was achieved. The Hasmonean family ruled the small kingdom of Judea for several generations, assuming the offices of both king and high priest even though the high priesthood was a hereditary office to which they had no legitimate claim. The Hasmoneans ruled until Pompey's armies captured Jerusalem in 63 BCE and established Roman hegemony.

Jewish Movements in the Second Temple Period

Various Jewish groups emerge in Judea in this period, each drawing to different degrees and with different emphases on these two ideological complexes to create a unique ideological

profile. Scholars have used the word “sect” to describe the distinct groups that arise in Second Temple Judaism, but this term is not entirely appropriate, implying as it does a normative orthodoxy from which organized splinter groups separate. We cannot speak of a single normative Judaism at this time; we may speak of a larger Jewish society, within which diverse movements arose. These groups certainly viewed themselves as distinct from other groups and may have marked that distinction through different modes of dress, behavior, and thought, but most were not strongly separatist.

The motivations for the formation of diverse movements within Jewish society are complex and varied, but divisions crystallized around certain focal issues and institutions—particularly the Temple and the Torah. The Temple and its sacrificial service were critically important symbols for all ancient Jews. Performed properly, the Temple rituals and sacrifices would attract and maintain the presence of God, ensuring blessings and bounty for the community. But a series of political realities compromised the integrity of the Temple leadership in the eyes of many. The Hasmonean usurpation of the high priesthood and Herod’s transformation of the position from a hereditary and lifelong office to an annual appointment were viewed by some as unacceptable deviations from God’s instruction. In addition, different standards of ritual and sacrificial purity led to conflict. Ritual purity was required of those who offered sacrifice, entered the Temple, or officiated within. Some Jews practiced an extreme form of ritual purity that went far beyond the biblical prescriptions. These Jews were angered by what they considered to be the laxity of those in control of the Temple and boycotted the Temple as long as their own higher standards were not in force.

The Jewish historian Josephus (d. ca. 100 CE) mentions three main Jewish movements beginning in the late second century BCE—the Sadducees, the Pharisees, and the Essenes. We have two additional sources of information about these movements—the Christian New Testament and the writings of later Jewish rabbis. Unfortunately each of these three sources has significant limitations. Josephus’ presentation is slanted toward the interests of the Roman audience for

whom he wrote and by his own political agenda. The Christian New Testament is a polemical work with strong theological and ideological reasons for discrediting first-century Jewish movements. It paints the Pharisees in particular as villains and hypocrites. Rabbinic writings contain some old and authentic traditions about Jewish movements in the late Second Temple period, but these traditions passed through a lengthy process of oral transmission and editorial revision before reaching the written form we possess. Due to the nature of our sources, any reconstruction of the major movements in Second Temple period Judea is necessarily tentative.

The Sadducees (Hebrew, *Zadokim*) appear to have originated in opposition to the Hasmoneans as a party that believed the priesthood belonged to the Zadokite line within the priestly fold. They appear to have been associated with the Temple leadership and are described by Josephus as wealthy and powerful. The Pharisees emerged also in the Hasmonean period as a kind of political interest group promoting certain goals for Jewish society. Josephus describes the differences between Sadducees and Pharisees as doctrinal in nature: the Sadducees denied immortality and reward and punishment after death while the Pharisees believed the souls of the righteous pass to other bodies after death; the Sadducees believed in a determinative fate with no free will while the Pharisees affirmed the interplay of fate and free will. Another point of disagreement was over the nature and source of Jewish law. The Pharisees were skilled in jurisprudence and claimed to possess in addition to written Scripture, a body of unwritten ancestral traditions—oral teachings, laws, and interpretations that adapted the Bible to the needs of a new age. The Sadducees rejected the notion and authority of ancestral teachings.

In stark contrast to Josephus’ testimony, rabbinic sources detail disputes between Pharisees and Sadducees that center on matters of law, ritual purity, the Temple cult, tithing, Sabbath observance, and the interpretation of Scripture. The Pharisees were probably a kind of educated, voluntary association with members drawn from all walks of life that promoted the observance of Sabbath laws, purity, and tithing—all important in maintaining Jewish identity. They practiced a

kind of table fellowship (*bavurah*) of persons who aspired to a higher level of purity in connection with consuming food. The Pharisees hoped for a Jewish community dedicated to the covenant, as they interpreted it, and sought to transform daily activities into sacred or semi-sacred occasions. The word Pharisee is from the Hebrew word “*parush*” meaning “separated.” The name may derive from the fact that the Pharisees separated themselves to some degree from those who were less observant of the laws of purity and tithing.

For all their differences over questions of authority and leadership the Pharisees and Sadducees were both involved in the community. Other groups gave up on Jewish society, rejected the existing leadership, and withdrew to form small holy communities. According to Josephus, the Essenes formed separatist associations throughout the country. Admission to their community required a three-year period of preparation and probation and culminated in the taking of oaths, including an oath to be obedient, to guard the secrets of the sect (including the names of the angels), and to “hate forever the unjust and fight the battle of the just.” The community followed a rigorous discipline centering on ritual and moral purity. Property was in some way communal and members practiced celibacy, though Josephus mentions a second order of Essenes that did marry. Dress was simple and daily communal meals included prayer and recitation of Scripture. Essenes believed in the immortality of the soul and were possibly dualists.

Roman Rule over Palestine

Roman governance over Palestine developed from Roman military excursions and interventions in the Levant, which brought it into contact with the Hasmonean (a Hellenistic) kingdom centered in Judea in 63 BCE. Following the defeat of Mithradates VI of Pontus, Roman general Pompey remained in the area to ensure stability. Roman intervention in Hasmonean affairs led to the establishment of the client-kingdom status of Judea under the nominal leadership of Herod the Great. Roman interference in the selection of Judean leadership drew it deeper into internal affairs. Roman authority gradually increased at the expense of regional autonomy. As a consequence, three major rebellions took place against Roman rule of Palestine: the Great Revolt (66–70 CE), the Kitos War (115–117 CE), and Bar Kokhba’s Revolt (132–135 CE), which resulted in Roman direct rule, the destruction of the Jewish state in Palestine, and the dispersion of the Jews (the Diaspora) throughout the Roman empire.

Following the defeat of the Hellenistic king Mithradates VI of Pontus and the annexation of its lands to Rome, the Roman general Pompey remained to ensure the stability of these newly acquired provinces in 63 BCE. In the neighboring Hasmonean Jewish kingdom of Judea, dynastic feuding brought Pompey’s influence to internal affairs, as he helped install Hyrcanus II as leader. This brought Roman interests into Judean politics, thereby ending Jewish political sovereignty. Pompey’s successor Antipas was officially a Roman procurator (provincial governor or prefect) who brought the realm into the indirect political control of Rome while maintaining the semblance of autonomy. Herod the Great, Antipas’s son, became king of Judea in 44 BCE with the blessing of the Roman Senate, thereby illustrating how Roman approval for leadership of the kingdom had become completely necessary. While

➤ JOSEPHUS

Flavius Josephus, otherwise known to posterity simply as Josephus, was a Jewish historian whose major work, *The Jewish Wars*, chronicles life during the early Roman rule of Palestine and the Great Revolt (66–73 CE). Initially a Jewish priest fighting against the Romans, he surrendered and was taken captive to Rome in 71 CE. He became a Roman citizen and served the Flavian dynasty in power, taking the name Flavius. While in Rome, Josephus wrote his works on Roman Palestine and the Jewish resistance, discussing the various Jewish sects and the major events of the revolt. While much of his work is essential to scholars of the Jewish revolt and Roman Palestine, his Roman sympathies are prevalent throughout the work. His reputation is therefore that of a Roman apologist, regardless of the value of his writings as a primary source for the period.

—Abraham O. Mendoza

Herod was nominally a client-king under Roman authority, the realm was still characterized by a Roman military and a growing Roman bureaucratic presence. Herod's heirs, who ruled as tetrarchs over portions of the former Jewish kingdom as it was divided upon his death (in 4 BCE), were also dependent on Roman goodwill to maintain their political position and legitimacy.

Judea was incorporated into the greater Roman province of Iudaea in 6 CE while remaining nominally under the rule of Herod's successors. As a province of Rome, Judea was subject to taxation and the census, which were resented by many Jews as infringements on their culture and religion. Prefects of Rome, such as Pontius Pilate, were directly responsible for the governance of the kingdom regardless of the client-king in power. While able to maintain varying degrees of power, Herod's successors depended on Roman support for their rule. It was during this time that the various Jewish sects (such as long-standing sects-cum-political factions such as the Pharisees, the Sadducees, and the Essenes) were driven to resist Roman authority and the compliance of Jewish elites with Roman rule. Furthermore, the historical Jesus also emerged in this

period as part of this greater Jewish resistance against Roman cultural hegemony.

Growing tensions with Roman hegemony eventually led to three major Jewish revolts against Roman authority and their alleged Jewish collaborationist elites in Palestine: the Great Revolt, the Kitos War, and Bar Kokhba's Revolt. Superior Roman military forces ended each of these revolts, and these military victories led to direct Roman rule of Palestine, thereby ending any pretence of sovereignty under a native Jewish client-king. Furthermore, tens of thousands of Jews were executed or sold into slavery during the onslaught of the Roman legions quelling these various Jewish insurgencies. Historians debate whether the Jewish Diapsoa began with the destruction of the Second Temple in 70 CE or with the end of Bar Kokhba's Revolt in 135 CE. After the destruction of Jewish forces in Bar Kokhba's Revolt, Roman emperor Hadrian reorganized the province as Syria Palestina and changed the name of Jerusalem to Aelia Capitolina. This suggests an attempt by the Romans to eliminate any cultural remnants of Jewish culture and religion in Palestine, regardless of the remaining scattered communities in the region.

Roman Palestine remained an important trade and strategic center of Roman rule in the eastern Mediterranean, as it served as a link for trade with the East and for military ventures against the Parthian empire. With the end of Jewish resistance, other regional cultural groups under direct Roman rule became prominent in the region along with remaining Jews. Furthermore, from the second century to the fifth century Christianity grew in this region in particular, given the efforts of the early Christian apostles and their followers in spreading the faith regardless of the consequences under Roman persecution.

During the reign of Diocletian (284–305 CE) the region was divided into Palestina Prima, Secunda, and Tertia for administrative purposes. Following the division of the Roman empire into western and eastern administrative regions under Constantine I (306–312 CE), Roman Palestine essentially became Byzantine Palestine, which would last until its conquest by Muslim Arabs in 638 CE.

Philistia and Phoenicia in the Iron II Period

Philistia and Phoenicia were both located on the Levantine coast, Philistia in the south (in what is today known as Israel) and Phoenicia in the north (in present-day Lebanon). Throughout the Iron II period these regions were not centrally unified, but both consisted of independent city-states that were loosely affiliated and sometimes ruled by other larger polities (especially the Assyrians).

The Philistines had settled along the coast of Israel at the end of the Late Bronze Age and the beginning of the Iron I period. Originally a Greek group, one of the Sea Peoples as they were called in ancient texts, over the course of Iron II the Philistines were gradually acculturated into Israel and Judah, although ethnically they were considered distinct. In the biblical accounts, the Philistines were the enemies of Israel, with Goliath the most notable villain. This animosity between Israel and Philistia has colored the biblical accounts of the Philistines, portraying them as ruthless savages when in fact archaeological excavations have demonstrated that they were a highly sophisticated urban culture.

There were five main cities of ancient Philistia (Ekron, Gath, Gaza, Ashkelon, and Ashdod), referred to by modern scholars as the Philistine Pentapolis. Ekron, Ashdod, and Ashkelon have been extensively excavated by archaeologists. Gaza has not been excavated, and excavations have recently begun at a site that most scholars believe is Gath. These excavations, most of which have been conducted over the past 30 years, have dramatically increased our understanding of Philistine culture. In the tenth century BCE at the be-

Ruins of the ancient Philistine city of Ashkelon, Israel, photo from 1921. (Library of Congress)

ginning of the Iron II period, the cities of the Philistine pentapolis were independent but affiliated with one another. Their territory had shrunk significantly from the Iron I period. With the advent of the Iron IIB period (the period of the divided monarchies of Israel and Judah), relations between Philistia and Israel were relatively peaceful. Relations between Philistia and Judah became more complex in the Iron IIC period during which Philistia may have been conquered by the Judean king Hezekiah very briefly. Soon after the Assyrians conquered Philistia, and the region became part of the larger Neo-Assyrian empire. Under Assyrian control, the cities of the Philistine pentapolis thrived, growing much larger than previously. Much of this growth was stimulated by relations with Assyrians, who seemed to have established Philistia as a region of extensive agricultural and industrial production. Philistia passed briefly into Egyptian control before it was destroyed by King Nebuchadnezzar of Babylon once and for all in 586 BCE.

Unlike Philistia, which seems to have lost regional power and territory at the beginning of the Iron II period, Phoenician power seems to have expanded at this time. The Phoenicians were the descendants of the Canaanites, but by the Iron II period this civilization continued on only in the north, having been displaced by the Philistines and the Israelites. Centered on the

THE PHOENICIANS AND PUNIC IDENTITY

Along with the expansion of their trade networks, the Phoenicians established colonies in North Africa, Sicily, Sardinia, and Spain. Carthage, located in North Africa, was arguably the most important of these colonies and would eventually develop an empire of its own until its defeat by Rome in the Punic Wars. “Punic” is the term used for the Phoenician language as attested in North Africa. The issue of what constituted Punic identity is a difficult one for archaeologists. There certainly seem to have been strong ties between Carthage and the other Phoenician colonies, but there are also significant differences between the various sites. It is also unclear how significant a role indigenous traditions at these locations played in Punic culture.

—Kevin M. McGeough

coast of Lebanon, Phoenicia consisted of a series of independent city-states oriented toward maritime trade. The most prominent of these cities in the Iron Age were Tyre and Sidon. The boundaries of Phoenicia were fairly circumscribed: the Mediterranean Sea on the west, the Lebanon and Anti-Lebanon Mountains to the east, around the city of Arwad in the north, and near the city of Akko in the south. Since Phoenicia is better thought of as a group of culturally connected city-states rather than an integrated state, these boundaries are best thought of as approximate.

The geographic location of Phoenicia defined much of the commercial opportunities and character of the people. The Lebanese mountains provided rich sources of timber yet at the same time limited the agricultural possibilities for the Phoenicians. Thus, the Phoenicians cities relied on maritime trade as the basis of their economic livelihood, selling wood and dye produced from murex shells found on the Mediterranean coast as their main commodities. The Phoenicians expanded their trade system so that they came to be middlemen for many products sold throughout the eastern Mediterranean. The most important class of item that the Phoenicians distributed throughout the Mediterranean was raw metals, essential for the production of bronze and iron.

While the Phoenicians never seemed to have developed a centralized state government, they did attract the attention of other imperial states. By the mid-eighth century BCE, Phoenicia had fallen under the control of the Assyrian empire. The Egyptians took control of Phoenicia away from the Assyrians briefly in the seventh century, only to be conquered again by the Assyrians and then the Babylonians. In 539 BCE the Persian empire conquered Phoenicia and controlled it until Persia was routed by Alexander the Great. From 332 until 198 BCE, the Seleucids and Ptolemies (the successors of Alexander the Great) fought for the region, with the Seleucids eventually becoming victorious. From this point forward until the conquest of the region by the Romans, the Phoenician cities grew more politically autonomous, although their naval mercantile ventures had remained relatively unaffected by these shifts in imperial power.

Emergence of the Phoenician Cities

The Phoenician cities in Lebanon existed prior to 1000 BCE, but their fortunes increased tremendously after the Sea Peoples passed through the Mediterranean basin. Tyre rose to prominence as

the Phoenicians' leading city under King Hiram, whom the Bible described as making peace with Israel and helping to build the Temple of Solomon in Jerusalem.

Having achieved peace at home, Tyre accelerated the planting of Phoenician colonies across the Mediterranean, including the great city of Carthage. Their widespread sea trade brought many exotic goods and innovations and much wealth to themselves and to the lands around them. One of their most significant contributions was the 22-consonant Phoenician alphabet. The Greek alphabet was developed from this by adding vowels, which enabled the great works of Socrates, Euripides, and others to be written.

The Phoenicians created royal purple cloth, delicate glass bottles, and intricately carved silver bowls. They developed city councils and a representative government, which Aristotle admired. Yet the Phoenicians' great success upon the seas was tempered by difficulties at home. In 738 BCE the Assyrians established themselves as overseers of the northern Levant and demanded tribute from the Phoenicians. As previously done with the Egyptians (1479–1176 BCE), the Phoenicians used their ability to create wealth through sea trade to obtain a semi-independent status. Some sea-trade activities were transferred to Carthage, their main colony in North Africa, where they operated with complete freedom.

In 604 BCE the defeat of Assyria by Babylon simply meant a change of overlords for Lebanon. Tribute was paid as before, but this time it bought somewhat less freedom. Another change came in 539 BCE when the Babylonians fell to the Persians. This time the Phoenicians took the initiative and offered their services to the Persian king, Cyrus the Great. The king was pleased and extended a higher degree of freedom in exchange for the customary tribute. Herodotus noted that when the Persians wanted to seize Carthage, the Phoenicians strenuously objected to this attack on their daughter city. Surprisingly, the Persian king deferred to them and abandoned his campaign. This influential relationship continued to greater or lesser degrees during the Greek-Persian War, when the Phoenician cities provided a considerable navy to support the vast armies of Persia.

Then in 333 BCE, Alexander the Great defeated the Persians in Anatolia and marched south to confront the Phoenician cities. All of these Lebanese towns surrendered to him except for Tyre, which sat astride an island with massive defenses. In its long history, Tyre had never been taken. But Alexander brilliantly built a causeway to the island. In 332 BCE his army poured over the causeway and forced the last Phoenician city in Lebanon to fall.

When Alexander died a few years later, the Phoenicians continued their tributary status to one of his successors. Their modest freedom of action continued because of their ties to Carthage, which was now a great city in its own right. When Carthage lost the Punic Wars to the rising city of Rome in 146 BCE, the North African city and all its colonies dropped into Roman hands. With that, the Phoenician society in Lebanon, having no further outside support, finally faded from view.

The Rise and Fall of Small States in Jordan—Ammon, Moab, and Edom

During the Iron II period (ca. 1000–586 BCE), three small states arose in the area now known as Jordan: Ammon, Moab, and Edom. These three polities are mentioned frequently in the biblical accounts, but little was known about them until archaeologists began exploring the region. Our knowledge of these three states is still in flux and is subject to change as more archaeological discoveries are made.

According to the Hebrew Bible, the state of Ammon was located between the Arnon, Jabbok, and Jordan rivers, although the exact borders probably fluctuated throughout Ammon's

THE LANGUAGES OF ANCIENT JORDAN

The languages of ancient Jordan were all long forgotten until archaeological excavations unearthed ancient inscriptions in these languages. Since the Jordanian languages are very similar to Hebrew and Aramaic, it has been possible for language specialists, known as epigraphers (people who study ancient writing), to reconstruct these languages even though very few long inscriptions have been discovered. The most important inscription is the lengthy Mesha Stele. However, most inscriptions are found on seals, which were used as ancient means of signing a person's name. Thus, the inscriptions usually are simply a personal name with perhaps an occupational title or brief sentence, usually indicating a particular religious affiliation. Ammonite, Moabite, and Edomite have all been identified as individual languages; all are related but have distinct grammar, spelling, and vocabulary.

—Kevin M. McGeough

The Mesha Stele is a large basalt stele that details the Moabite king Mesha's rebellion against the Israelites, ninth century BCE. (Singer, Isadore, ed. The Jewish Encyclopedia, 1901)

existence. Although the Bible describes Ammonite culture as contemporary with King David, there is little evidence for it prior to the Iron IIb period (925–720 BCE). At that time a large city, Rabbath-Amman, emerged and was located in the downtown of the modern city of Amman. Since this ancient capital is still occupied, archaeological explorations have been limited (although there have been a number of small-scale investigations). A palace dating to the Iron IIc period (720–586 BCE) may have been identified at the site. This was a building with large walls, a large courtyard, and plastered floors in which numerous international objects were found, all characteristics of palace or administrative complexes in the Near East in the Iron Age. The best information regarding Amman comes from excavations of outlying settlements. The Madaba

Plains project has sought to investigate the Ammonite state outside of the capital with a major emphasis on the study of subsistence practices. One of the sites excavated under the aegis of this project is Umayri, where a large administrative complex has been excavated that likely functioned on behalf of royal authority over the farmland in the region. Scholars disagree on whether or not the site of Heshbon was part of the Ammonite kingdom. A large water reservoir dating to Iron IIa has been identified here and was likely built as a royal project. The small city of Jawa has been well excavated and provides much information on the nature of Ammonite urban areas. Jawa was surrounded by a city wall, and a city gate has been identified by the excavators. Houses at Jawa were made up of numerous interconnected rooms. Ammonite for-

tresses have also been identified, one of which (located at Rujm al-Henu) featured rectangular and circular towers. Numerous Ammonite inscriptions have been recovered that provide important information about Ammonite religion, the main deity of which was Milkom.

Moab was located south of Ammon. The earliest reference to Moab, so far identified, is in an Egyptian inscription dating to sometime between 1304 and 1237 BCE (within the Late Bronze Age) that commemorates Egyptian military successes in Jordan. It seems likely that the Egyptians held some authority in this region until the end of the Late Bronze Age, although evidence for this is meager. During the Iron I period (1200–1000 BCE), the population in this region began to grow. Only a few archaeological sites have so far been excavated in the region, but a number of smaller fortress-style settlements have been identified that may indicate the beginnings of an organized defensive strategy. Early in the Iron IIb period a centralized state arose, likely centered at the capital city of Dhibon. Dhibon was the location of the Mesha Stele, one of the most important archaeological finds for the study of Moabite. The Mesha Stele is a large basalt stele, now broken, that details King Mesha's rebellion against King Omri of Israel (a historical event described from another perspective in 2 Kings 3 in the Old Testament). Mesha credits the Moabite god Kemosh with his success in establishing the state of Moab independent of Israel's rule. Moab thrives through the rest of the Iron IIb period but seems to have declined in the Iron IIc period. Part of this decline may have been the result of Assyrian imperial expansion. After the military campaigns of King Tiglath-Pileser of Assyria in 734–732 BCE, the region fell under the authority of this Mesopotamian empire and was obliged to make heavy tribute payments to them.

Edom, which was located south of Moab, came into existence much later than Ammon and Moab. Throughout the Iron IIa and IIb periods pastoral groups lived within the region, and during the eighth century a fortress was built in the region. In the Iron IIc period as the state of Moab started to decline, the state of Edom arose, with its capital at Bozrah (Buseirah). Many of the other Edomite settlements are located in out-of-the-way locations and rocky crags. Fortresses were also

typical Edomite structures, with Kheleifeh (north of the Gulf of Aqaba) the best understood. As the Iron IIc period progressed, the Edomites expanded across the Jordan River into the Negev Desert, gaining the territory from the kingdom of Judah. One southern Judean fortress, Uza, was briefly captured by the Edomites, as suggested by the presence of an ostrakon written in Edomite. The Edomites used a script that combined elements of Hebrew and Aramaic script. The deity Quas was the chief god of the Edomites.

Adiabene

Adiabene (Hebrew, *Hadyab*; Syriac, *Hadayeb*) was a district in ancient Mesopotamia (present-day Iraq) along the upper Tigris River valley. During the Hellenistic period Adiabene was nominally a vassal kingdom of the Parthian empire; like most Parthian vassal-states, it was largely independent. It was inhabited by a primarily Aramaic-speaking population, likely among the ancestors of Iraq's modern Assyrian and Chaldean communities (although some Kurdish nationalists claim that Adiabene was a Kurdish principality).

Little is known about Adiabenean politics and history prior to the early first century CE. Judaism became the official religion of the kingdom under Izates (the son of Monobaz), who became king of Adiabene in around 36 CE. Izates

THE ADIABENE-JUDEAN CONNECTION

In the decades following their conversion to Judaism, the Adiabenean royal family encouraged settlement of Jews in their kingdom and brought scholars from the Jewish communities in Babylonia to instruct them in their new religion. It is likely through these teachers that the Adiabenean royal family established strong ties with the Jews of the Levant, particularly with the community in Jerusalem. According to the Talmud and other rabbinical writings, many of the ritual implements used in the Temple of Jerusalem in the mid-first century CE were donated by Helena, Izates, and Izates's brother and successor Monobaz II.

When Helena visited Judea around 45 CE, she earned the admiration and love of the inhabitants by purchasing huge quantities of grain and figs to provide famine relief. Not content with this gesture, Izates supplemented his mother's charity with large sums of money. Helena constructed a palace just outside Jerusalem where she spent much of her time until her son's death around 60 CE, at which time she returned home and died shortly thereafter. Monobaz II sent his brother's and mother's bodies to be buried in a mausoleum north of the city that was topped with a pyramid and known to posterity as the Tomb of the Kings. Adiabene and its rulers continued to inspire the Jews of late antiquity, and Izates, Helena, and Monobaz II are remembered quite fondly in rabbinic literature.

In 1863 the French archaeologist Felicien de Saulcy began excavations at the Tomb of the Kings. Some 48 sarcophagi were discovered, including 1 identified as that of Queen Helena of Adiabene.

—Brian Gottesman

had been exposed to Judaism while a youth in Characene (a kingdom around present-day Basra, where Izates may have been sent as a hostage). He and his mother Helena both converted to Judaism upon his return to Adiabene. Josephus relates that Ananias, a Jew of Characene, and Eleazar, originally from Galilee, were instrumental in their conversion.

Izates became very influential within the Parthian empire in 37 CE when the Parthian king Artabanus II was driven from his throne by the Roman-supported usurper Tiridates. Artabanus fled to Izates's court where the Adiabenean

king, through a combination of military support and skillful negotiation, aided Artabanus in his struggle. For his efforts Izates was granted extensive territories in northern Mesopotamia, including the city of Nisibis.

During the Jewish rebellion against Rome (ca. 66–70 CE), the royal family of Adiabene took an active role in providing support. It is likely that the Parthian government encouraged this assistance as a means of disrupting Roman rule in the Middle East. Two Adiabenean noblemen, Monobaz (a relation of the king) and Cenedaeus, were, according to Josephus, “the most distinguished for valor” in the Jewish ranks.

A ruler of Adiabene named Meheraspes is recorded as having been defeated by the Roman emperor Trajan during his conquest of Mesopotamia in 116. It is uncertain whether the dynasty of Monobaz II and Izates was still in power. During the second and third centuries it appears to have been ruled by Parthian governors before being conquered and subsumed within the Sasanid Persian empire.

Judaism appears to have been well established in Adiabene by the late second century CE. Christianity, which probably spread through the Jewish community and then to the population at large, began to dominate by the third century. It was a major center of the Church of the East (the so-called Nestorian or Assyrian Church). By the time of Constantine the Great, Adiabene is described in church sources as almost entirely Christianized.

The region's subsequent history is largely subsumed within that of Kurdistan.

■ Introduction: Greek Democracy

The development of democracy in Greece is one of the most important stories in world political history. Greek democracy and its institutions and political theorists have been profoundly influential in the course of world history, and today democracy is one of the most common forms of political governance. The democratic structures of the United States, for example, were directly inspired by the Greek traditions, and much of the architecture that stands in Washington, D.C., reflects Greek deals and aesthetics.

For the Greeks, democracy was a form of government in which the *demos* (which can be translated as “the people” but also refers to “the village”) governed itself. This was a novel type of political organization. Like much of the world, the largest polity in ancient Greece was the city-state, but what was unusual was the proportion of the population who participated in the political and governing process. This did not mean that everyone was included in the decision-making process. Only citizens were allowed to vote, and the definition of who was a citizen was narrowly defined (and excluded women). Despite this, the idea that people should govern themselves is one of the major contributions that the ancient Greeks made to world civilization.

—Kevin M. McGeough

The Origins of Greek Democracy

In ancient Greece political organization was dominated by the polis, or city-state. Each polis was governed by its own customs and laws, although there were many similarities in social and political structure throughout the Greek world. The political organization, or constitution, in an individual polis could range from a tyranny, or power residing solely in the personage of a single individual, to a democracy where the citizenry of the polis determined the selection of magistrates and even state policy.

In discussing the development of ancient Greek democracy, it is important to note that

the conception of democracy in ancient times is radically different than what is considered a true representative democracy today. While only citizens could participate in the election of officials and the formations of policy, the citizen body lacked the inclusiveness that is indicative of modern representational governments. Ancient citizenship was restricted to males and generally required a certain property qualification, which would allow the citizens to equip themselves as hoplites, the backbone of the ancient Greek fighting machine.

The need for hoplites and corresponding social and political developments that lead to democracy sprung from the Greek Dark Age. Dark Age social and political organization centered upon the strongman/king (*basileus*), who counted upon a group of retainers and companions (*hetairoi*) as a fighting force and as a council for his decisions. The position of the *basileus* was not that of an absolute ruler but instead was closer to a position as first among equals. The *basileus* could not simply command his *hetairoi* to do his bidding but instead had to convince, cajole, threaten, or otherwise influence his retainers that his plans and course of action were worth following.

The positions of the *basileus* and the *hetairoi* were hereditary, leading to a governing aristocracy that ruled the less economically prosperous farmers, merchants, and other societal members, in large part due to their exclusive control of violence through their armaments. This kind of society is reflected in the works attributed to Homer (the *Iliad* and the *Odyssey*), books that show the social organization of Greece in the eighth and seventh centuries BCE. The *hetairoi* in this context formed a kind of council, where theoretically the plans of the *basileus* were debated. The *basileus* would then present the course of action to the assembly of citizens (the *ecclesia*), where they were expected to affirm his decisions. While there was not a formal mechanism in place to compel the *basileus* to pay heed to the assembly, a king could only ignore the wishes of his assembled warriors at his own peril.

In the mid to late seventh century hoplite warfare began to take on a recognizable form. In this style of fighting, soldiers (hoplites) fought side by side in tightly packed ranks in a formation known as a phalanx. In this formation the shield of the hoplite would be protecting the hoplite to his left, creating a situation in which each man was forced to rely on another for protection, and thus the cohesion of the phalanx was critically important to survival. Therefore, the military necessity of this new form of warfare created a situation whereby any citizen who could afford the armor required for fighting could contribute in battle to the same extent as a wealthy aristocrat. This created a situation in which middle-class farmers who could afford armor were fighting with the same risks for the polis as a wealthy aristocrat, which in turn led to a desire for more equitable treatment in the political system at home.

Eventually, tensions between wealthy aristocrats and poor farmers reached a critical point. Poor farmers who suffered through an inade-

quate harvest could find themselves in debt to wealthier individuals and could even reach a state of debt slavery whereby the formerly free citizen was required to sell himself to his creditors to pay for his debt. This led to demands from the poor for land and debt reform, while the aristocracy was concerned with keeping their wealth and social position.

The Athenians then turned to Solon around 594 to construct new laws to govern the state. Solon, a man known for his wisdom, also composed poetic verses that are still known today. His reforms were not in any sense a radical democracy wherein every citizen in the state is on equal political footing. What Solon was trying to do was alleviate some of the main complaints of the poor and the masses of citizens while still preserving some privileges for the wealthy aristocracy. He abolished debt slavery, freed citizens who were already debt slaves, and expanded Athenian citizenship (an expansion that was to be later restricted in the fifth century). In order to placate the more privileged classes of aristo-

THE MILITARY AND ATHENIAN DEMOCRACY

Greek democracy was an outgrowth of the Dark Age system of warrior bands, where the king (*basileus*) would command his companions (*hetairoi*) in raids. While the people were represented in an assembly (the *ecclesia*), they existed primarily to affirm the intentions of the *basileus* and his council of *hetairoi*.

This system began to change with the introduction of hoplite warfare in the eighth and seventh centuries BCE. Hoplite warfare required dense masses of a fighting force that any individual citizen who could afford the armor was expected to participate in. Since these middle-class citizens shared the same burden in warfare as the aristocracy, they began to seek greater political equality at home.

This rising middle class was distinct from lower-class farmers and landless citizens who could find themselves reduced into debt slavery following bad harvests or other calamities. In protests of exclusive aristocratic control over the political system, the tensions between the poor and the aristocrats could erupt into civil discord (*stasis*), the outcome of which depended on the sympathies of the hoplite class.

If the hoplites were not supporters of the very poor, then such unrest could be quashed or alleviated through very limited reforms. If the hoplites found common cause with the poor, then it was possible for the aristocrats to lose control of the city-state (*polis*) and for a tyranny or democracy to take root. The hoplite class was supportive of the poor in the *polis* of Athens, where the best-documented development of democracy occurred.

In Athens, the citizen body succeeded in forcing the aristocrats to adopt some basic economic and

Fresco of a hoplite warrior, late fourth century BCE. Hoplites were heavily-armed and shielded volunteer infantrymen. (Gianni Dagli Orti/Corbis)

social reforms issued by Solon and, following the tyranny of Peisistratus and his son Hippias and the subsequent attempt at a coup by Isagoras, finally created a more representative system after the reforms of Cleisthenes.

—Ryan Horne

crats and hoplites, Solon also constructed a sliding scale whereby the highest offices of the state were restricted to citizens with the most wealth, and lesser offices required the officeholder to possess lesser amounts of wealth (in grain, oil, or produce). Solon also allowed any citizen to serve on a jury chosen by lots, which allowed even the poorest members of society to have a voice in the legal governance of the *polis*.

In 560 a relative of Solon named Peisistratus was able to seize the highly fortified central hill

of Athens (the acropolis) and declared himself a tyrant. He was expelled around 555 but was able to return and reassert his political control, was driven out again, and then went into exile until 546. In 546 Peisistratus returned to Athens with a force of mercenaries, and he was able to seize control once more until he died in 527. Although Peisistratus was a tyrant, or sole ruler of Athens, he continued to follow the law codes of Solon (even though he ensured that the councils were packed with his own supporters). After his death

his son Hippas (perhaps with his brother Hipparchus) inherited the tyranny, but Hipparchus was killed as a result of a lover's quarrel by two men, Harmodius and Aristogiton. Hippas then became a hated tyrant and was finally expelled in 510 by Spartan king Cleomenes, aided by an exiled Athenian family called the Alcmaeonids.

Factional strife followed, with an aristocrat named Isagoras being elected as archon in 508. Isagoras was a rival with another politician, Cleisthenes. Isagoras succeeded in exiling Cleisthenes and in convincing the Spartan Cleomenes to return in order to set up an oligarchy, but he was eventually driven out of the acropolis by masses of poor Athenians, who invited Cleisthenes to return to Athens. Cleisthenes then changed the legal system of Athens, establishing ten tribes based on separate geographic areas rather than kinship. This helped to break the old hereditary system of power and privilege, a holdover from earlier Dark Age social organization. In addition, Cleisthenes established the *boule*, or council of 500, randomly chosen from men of each tribe. Each tribe would be in charge of the *boule* for a tenth of the year, and these 50 men would be referred to as the *prytaneis*. Each tribe would also elect one *strategos*, an infantry commander, and a cavalry commander. Under this system the *boule* would present business to the *ecclesia*, who would then approve or reject the proposals of the *boule* and, with the assignment of archons by lot beginning in 486, paved the way for direct citizen votes on state policy.

This system stayed relatively intact until after the Persian wars, when citizenship began to be restricted and measures were passed for the payment of juries, the radicalization of the rowers of the Athenian Navy, the establishment of an oligarchy after the Peloponnesian War, and the eventual reestablishment of the Athenian democratic system.

Development, Administration, and Legal Structure of the Greek Polis

The polis, usually translated as “city-state,” was the central political unit of the ancient Greeks. The polis was an independent, self-governing, economically self-sufficient community and usually consisted of an urban center together with its surrounding countryside. While some of the physical features of the polis, such as walled cities and communal meeting places, are found as early as the Homeric poems, which may reflect developments of the period from 1200 to 800 BCE, the social and political framework of the polis did not arise until the eighth century BCE.

After the political and social infrastructure of the Mycenaeans had been obliterated during the twelfth century BCE, the Greeks were forced to start afresh at the village level. At first, local chieftains ruled over individual villages. This changed, however, following the drastic rise in population during the eighth century that resulted in the political integration of neighboring villages into urban centers, often at the base of a fortified citadel that served as a place of refuge. The process of political union brought with it administrative changes, as the powers of the local chieftains were distributed among the land-owning aristocracy, who ruled collectively as annual magistrates, guided by a powerful council of aristocratic elders. These leaders drafted policy and created laws for the polis as a whole.

By the late seventh century BCE the new economic opportunities afforded by the growth of trade and colonization resulted in a larger number of prosperous but nonaristocratic individuals who began to challenge the social and political dominance of the landed elite. In response to this social conflict, many lawgivers developed written law codes, which limited the arbitrary powers of the aristocratic magistrates. In some poleis (the plural form of polis), disaffected aristocrats took advantage of both popular discontent and the new hoplite (heavily armed infantry)

citizen army to seize power and rule as tyrants. While most tyrannies lasted no more than a couple of generations, the tyrants did succeed in limiting the power of the aristocracies and provided benefits to the masses in order to stay in power. Once the tyrants were overthrown, most poleis did not return to the status quo but instead began to develop more inclusive forms of government. These included democracies, in which every citizen theoretically had equal rights (although who counted as a citizen was severely restricted), and oligarchies, in which the full range of citizenship privileges was restricted to those above a certain income level.

In this period the rights of the citizen of the polis also began to be defined. These rights included the privilege to own land, to fight in the army, to participate in the assembly, and to hold office and serve as judges (these last rights only in democratic poleis, since in oligarchic poleis the eligibility to be elected as a magistrate was linked to income). Citizenship in a polis represented membership in a homogeneous community and excluded outsiders such as women, slaves, former slaves, and resident aliens (*metics*). By the Classical period in oligarchic as well as democratic poleis, the role of the assembly in the decision-making process began to rival that of the elected magistrates. In these systems all citizens, regardless of social or economic status, had a vote, and there was an emphasis on structured discussion to determine policy, although demagogic political leaders were often able to sway public opinion.

The legal structure mirrored the administrative structure of the polis in that as a whole, the body of citizens gradually absorbed the legal functions of the elected magistrates. In fifth-century Athens, laws were made by the majority vote of the Assembly. By the fourth century, the Assembly continued to pass decrees (ad hoc measures to address specific contingencies), whereas special boards of magistrates, elected from the people, continued to promulgate laws (permanent rules) in order to ensure consistency. In Archaic Athens, as elsewhere, judgments were pronounced by the elected aristocratic magistrates. Solon's reforms (ca. 594–590 BCE) created a People's Court of appeal, although the magistrates continued to make verdicts. By the Classi-

➤ ARISTOTLE'S VIEW OF THE POLIS

For Aristotle, the polis (city) was a natural part of human life and an integral part of human development. A person, in Aristotle's view, needs to be a member of a city, since people are what he considers to be political animals, and in this quotation Aristotle discusses how the polis is integral to human life.

"The final association, formed of several villages, is the polis. For all practical purposes the process is now complete; self-sufficiency has been reached, and while the polis came about as a means of securing life itself, it continues in being to secure the good life. . . . It follows that the polis belongs to the class of objects which exist by nature, and that man is by nature a political animal. Any one who by his nature and not simply by bad luck has no polis is either too bad or too good, either subhuman or superhuman—he is like the war-mad man condemned in Homer's words as 'having no family, no law, no home'; for he who is such by nature is mad on war; he is a non-cooperator like an isolated piece in a game of draughts."

—Frances Pownall

cal period, courts composed of representatives of the people took over from the magistrates (the process of transferal is obscure) the rendering of verdicts as well. After the reforms of Pericles (who led Athens during approximately 461–429 BCE), those elected to serve as jurors were paid for their service, a measure that ensured that the juries represented a cross-section of the population in that it was (theoretically) possible for a poor man to forego his wages and serve on a jury. The concept that an accused should be judged by a jury of his peers is one of the greatest legacies of the ancient Greeks to Western civilization.

Greek Concepts of Citizenship

In ancient Greece, the concept of citizenship was intertwined with an individual city-state (polis) due to the lack of political unification of Greece itself. For the Greeks in the Classical period, citizenship was participation in the political life of the polis, although this civic involvement could vary greatly between different cities. In general, citizenship focused on several factors including the ability to fight for the polis as a hoplite, the ability to participate in the decision-making process (even if the assembly was functioning as a rubber stamp to aristocratic or oligarchical governments), ownership of property, and the ability to run for (or be selected for) office, which was restricted to males. Citizenship was also tied into notions of ethnic homogeneity whereby membership in one of the ethnic groups comprising the polis was critical. Citizenship also had religious overtones, with citizens being expected to take place in festivals and other religious events to reinforce the cohesion of the community. While the specific definitions and requirements for citizenship could vary from polis to polis, the two best-attested systems in the ancient Greek world were that of Athens and Sparta.

Athens held to the same general rules of male citizenship as other cities, although with the increasing importance of poor ship rowers after the Persian wars of 481–479, citizenship was extended to the lower strata of men with property, which was insufficient to arm themselves as hoplites. This enfranchisement would lead to later tensions between the democratic and aristocratic factions within the polis and

would have disastrous results following the Peloponnesian War. Men were allowed to vote in the assembly and could potentially be selected for office by lot or could run for elected offices such as one of the generals, or *strategoi*.

While women were considered part of the community of a polis (they were still part of one of the *phratries*, or an ethnic group comprising the polis), they were almost invariably banned from participating in any civic offices, military functions, or court proceedings. Athenian women were still important in conceptions of citizenship, as in 451 BCE the statesman Pericles was able to force legislation that restricted citizenship to individuals who had two Athenian parents. Women were essential to the conception of who could be considered an Athenian citizen, but they were themselves in no way equal to the status of the male citizens. Women were not allowed to truly own or inherit property but served as a method for transferring property between two males.

Women were not the only residents of a polis who did not enjoy full political participation. In Athens there were large numbers of nonresident aliens who were called *metics*. These metics were generally merchants, craftsmen, and businessmen who were attracted to Athens due to economic opportunities, especially after the construction of the Athenian empire. Metics were unable to purchase property, attend the assembly, or hold public office, but they were able to participate fully in the social life of the city.

Slaves were another class of people who lived within Athens and were not given any form of political involvement. Slavery in ancient Greece was not seen as a socially unacceptable institution, and slaves could be found in a wide variety of jobs, from mining and unskilled agricultural work to banking and specialized clerical functions. While slaves could be freed, in Athens such slaves would generally join the ranks of the metics unless the assembly decided to honor them as citizens (a rare but not unheard of event).

Citizenship in another major polis, Sparta, featured many similarities to and some differences from the Athenian model. Sparta's system of government was on a permanent militaristic footing, where Spartan citizens (Spartiates) were supported by two underclasses, the *perioeci* and

the *belots*. The development of hoplite warfare in Sparta (no earlier than 675) created a requirement, much like other poleis in Greece, for heavily armored hoplites to fight in close formation while wearing expensive bronze armor. In order to create a fighting force that met the requirements of hoplite warfare, the Spartans created a unique system of military training and citizenship status. This system was attributed by the Spartans to Lyscurgus, a possibly mythical lawgiver. In the Spartan system, training and selection began at birth: if a male child was seen as possibly unfit to enter the training system, then the infant was exposed and left to die. When the child was 7 years old he was enrolled in the *Agoge*, or Spartan education system, where he would learn to be a proper Spartan warrior. When the Spartan child reached the age of 18, promising candidates were selected to elite positions, while others had to wait until the age of 20 to be enrolled into a Spartan mess.

The Spartan mess was the centerpiece of Spartan male citizenship. A young Spartan had to be voted into a mess by its members, and a Spartan who was unable to join any mess would be seen as outside the Spartan community. Membership in the Spartan mess was contingent upon an individual providing a base allotment of food, which the Spartan warrior gained from his parcel of land, known as a *klaroi*.

The Spartan citizen did not work the land himself, however. Since citizenship in Sparta was so fixated on the development of military capabilities and discipline, the thought of a full Spartan citizen reducing himself to agriculture work was unthinkable. Instead, each Spartiate's land allotment was worked by a number of *helots*, or slaves owned by the state. These helots were inhabitants of the areas surrounding the polis of Sparta who had been subjugated early in the formation of the Spartan city-state. These people were seen as nearly subhuman by the citizens of Sparta even though they would occasionally serve a valuable role as auxiliaries in the Spartan Army in times of emergency. The helots had absolutely no citizen rights, civic participation, or legal protection, and the Spartan state would annually declare war on the helot population, removing any guilt if a full Spartiate happened to kill a helot.

➤ GREEK CLASSES

In ancient Greece, the concept of citizenship was intertwined with an individual city-state (polis). The citizen of a polis was a male member of the ethnic group (or groups) comprising the polis, generally produced enough produce from his land to equip himself as a hoplite, was able to own property, participated in communal religious festivals, and was able to participate in some level in the communal assembly (*ekklesia*).

Women, while considered part of the ethnic makeup of the polis, were not considered citizens. Women could not participate in the military, were unable to hold office, were unable to speak or vote in the *ekklesia*, and were severely restricted in land ownership.

In both Athens and Sparta there was a class of resident noncitizens who contributed to the economic prosperity of the polis. In Athens these people were referred to as *metics*, and although they were not allowed to participate in the city politically, they were afforded no particular social stigma for their position. In Sparta noncitizen residents were called *perioeki* and were the only individuals allowed to engage in commerce and craftsmanship. The *perioeki* could receive some measure of local autonomy, but they were still dominated by Sparta.

Finally, slaves were a ubiquitous presence in ancient Greece. Slaves were afforded no political voice and no citizen rights, and they faced minimal (if any) legal protection. Slaves could be owned by an individual or the state. In Sparta the state-owned slaves were known as the *helots*. The helots were forced to work the fields for Spartan citizens, and the suppression of helots became one of the central tenets and rationales for the Spartan militaristic system.

—Ryan Horne

There was another class of residents in Sparta, the *perioeki*. These people were merchants, craftsmen, and traders and generally functioned as the economic production arm of the Spartan state since full Spartiates were restricted to military pursuits. The *perioeki* also served as lighter-armed auxiliaries far more regularly than the helot population, and the Spartans would refer to their towns as a polis. However,

unlike a real Greek polis, the perioeki were unable to formulate any policy in relationship to Sparta, but they still retained some level of local political rights. The perioeki then provided essential economic and military services to the Spartan state but were unable to share in the full citizen rights.

As in other Greek cities, Spartan women were not considered full political citizens in the same way as men, but they had some unique freedoms and roles in the state. Women in Sparta were educated by the state, an almost unique phenomenon in the Greek world. Women were also allowed to own and inherit land in their own name, not just serving as a method for transferring land from one male to another. Spartan women who died in childbirth were also allowed a tombstone, an honor that Sparta allowed only to those women and warriors who had died in battle. Despite these rights, many above the rights granted by democratic poleis such as Athens, women were still unable to address or vote in the assembly, hold public office, be any of the two Spartan monarchs, or serve in the military. Women were still not full Spartan citizens in the same way the fighting men were.

Politics in Athens

During the first millennium BCE, a unique combination of factors came together in Greece that led to the development of democracy. The very word “democracy” is a Greek word, meaning “people” (*demos*) and “rule” (*kratos*). Several Greek poleis (city-states) experimented with forms of democracy; however, the first purely direct democracy evolved at Athens. Believing in the fundamental ideal of liberty, the Athenians exercised their freedom to participate in government, to live as they pleased, and to speak

their minds. Although limited to male citizens, Athenian democracy was still a revolutionary form of government in a world of hereditary monarchs, theocrats, and god-kings. Slow to evolve and imperfect in many ways, Greek democracy set the stage for the development of modern democracies.

Perhaps the single most important factor that opened the way for democracy was the period of Greek history from 1100 to 800 BCE, known as the Greek Dark Ages. During this era, foreign invaders weakened the indigenous Mycenaean monarchies and brought about a period of population decline and cultural stagnation. When stability resumed and the Greeks began gathering in their newly emerging poleis, they were free to develop whatever forms of government they chose. Contributing to that independent spirit was the mountainous terrain of Greece that separated the various poleis and allowed them to develop individually. Add to those factors the humanism found in Greek religion, the competitive spirit of Greek athletics, the open questioning of Greek philosophy, and the primacy of Greek rhetoric and oratory, and the stage was set for an entirely new form of government: democracy.

The most complete record for the evolution of Greek democracy comes from Athens, the largest of all the Greek poleis. Like most poleis, Athens was originally a monarchy, but in 683 BCE the first step toward democracy was taken when the *basileus* (king) was replaced by a board of administrators called *archons*. Archons were elected each year by an assembly of adult male citizens. At first there were 3 archons: the *basileus*, who oversaw religion; the archon, who oversaw political life; and the *polemarch*, who oversaw the military. Later, 6 archons called *thesmothetai* were added to oversee judicial matters, and 1 additional archon was added to serve as secretary to the thesmothetai, for an eventual total of 10 archons serving on the board. Following their year in office, archons moved on to the Areopagus, which was a permanent council that increased in numbers until it reached about 300 members.

In theory, all Athenian citizen males could vote in the assembly and hold office, but in practice, only the wealthy aristocrats wielded enough

power to get elected. At the beginning of the sixth century BCE, a reformer by the name of Solon was able to break the stranglehold that the hereditary aristocracy had on political opportunity by dividing the Athenian citizenry into four classes based on the incomes derived from their farms. Members of the top two classes could hold major offices, the third-tier class could hold minor offices, and the lowest-tier class was permitted only to attend the assembly. Although still based on wealth, Solon's system provided an opportunity for advancement to any individual who was willing to work hard and increase his class standing. Solon is also credited with creating a *boule* (council) of 400, whose responsibility it was to prepare issues for the assembly, and with creating a new set of laws.

During the late sixth century another Athenian reformer, Cleisthenes, reorganized the citizen population into 139 units called *demes* (people), which were then grouped into 30 *trittyes* (thirds) and 10 *phylai* (divisions), thereby separating established tribal groups into new political units. Cleisthenes increased the *boule* to 500 members, with 50 members drawn from each of the 10 *phylai*. Cleisthenes' reforms brought politics to the local level, where ordinary men could participate in the workings of government. The term *demokratia* (democracy) was perhaps first coined during this time. Cleisthenes is also credited with the introduction of ostracism, named for the *ostraca* (pottery shards) upon which the Athenians scratched their votes. Ostracism was a process wherein an unpopular individual could be voted out of Athens for ten years. The practice of ostracism served to eliminate political opponents and dissidents.

In 501 BCE the polemarch was replaced by a board of ten *strategoi* (generals) to oversee the military, with one *strategos* elected annually from each *phyle*. Over time, the power of the *strategoi* expanded beyond just military matters, and the *strategoi* became important political leaders as well, as in the case of Pericles, the popular fifth-century Athenian general and statesman. In 487–486 the method of selecting archons changed from election to sortition (selection by lot) wherein archons were selected at random from a prepared list. Sortition reduced

View of the rock-cut platform (the bema) on the hill of Pnyx, just west of the Acropolis in Athens. This was the site where an assembly (the Ecclesia) met during the fifth–fourth centuries BCE to consider issues raised by the town council. All citizens could speak, and majority rule was the method for decision making. (Carl Rasmussen/Holy Land Photos)

the dominance of the wealthy aristocrats and offered citizens of all classes the opportunity to serve and to gain political experience. In 462 Ephialtes introduced reforms that took power away from the Areopagus and divided it among the assembly, the *boule*, and the courts. Pericles then introduced pay for individuals serving on juries and the council, opening the way for even the poorest citizens to participate in the Athenian democracy.

In 411 and 404 antidemocratic factions blamed democracy for the losses that Athens incurred during the Peloponnesian Wars, and oligarchies (rule by a few) replaced democracy. Each time, the oligarchies were overturned and democracy was reestablished within a few months. Perhaps the most notable complaint against democracy was brought by the philosopher Plato, who blamed democracy for trying and condemning to death his teacher and mentor, Socrates, in 399 BCE. In his writings, Plato questioned the ordinary citizen's capacity for rational thought and action, and he proposed that only educated specialists (philosopher-kings) be permitted to rule.

In spite of these antidemocratic movements, democracy continued on into the fourth century,

PERICLES OF ATHENS

Pericles was born at the beginning of the fifth century BCE, a time when democracy was just taking root in Athens. His father, Xanthippus, was an influential general, and his mother, Agariste, was the niece of the great reformer Cleisthenes, considered by the Athenians to be the founder of democracy. The family's wealth and position gave Pericles access to important Athenian social and political spheres within which he could utilize his intellect and ambition. Rather than using his position to advance the interests of his own aristocratic class, Pericles spent his career supporting and promoting Athenian democracy and working to extend participation in that democracy to all classes of citizens.

One of Pericles' first acts was to join with his fellow general Ephialtes in an effort to weaken the power of the Areopagus, an assembly of wealthy retired archons, by taking away their important political judicial powers and dividing them among the assembly, the *boule*, and the courts. Pericles

again joined with Ephialtes in overthrowing Cimon, a powerful aristocrat who outspokenly favored a limited democracy controlled by the aristocracy. In the mid-fifth century, Pericles succeeded in convincing the Athenian assembly to pass laws that gave citizens the direct vote both in the assembly and in the courts and that provided for most public offices to be selected by lot, thereby opening up those offices to all classes.

Pericles was the first to introduce the practice of pay for jurors, which meant that poorer citizens could serve on juries and have their voices heard without fear of loss of income. Soon after, payment for service was extended to citizens who served in capacities such as members of the Council of 500, archons, public officials, and active members of the army and navy, allowing many Athenians the ability to participate fully in their democracy for the first time. The strong foundation that Pericles laid for Athenian democracy lasted for over a century.

—Sonia Sorrell

with a few notable changes. The power of legislation and the jurisdiction in political trials were shifted from the general citizen body to a panel of 6,000 citizens who were selected annually by lot. The courts met about 200 days each year, and each day jurors were selected by lot from the panel of 6,000 to serve on juries ranging in size from 201 in private actions to 501 or more in public actions. During this period, Athens had about 1,200 magistrates, with about 100 of those elected by the assembly and 1,100 chosen by lot, who presided over the law courts and the decision-making bodies. The *boule* and the Areopagus prepared business for the assembly and heard homicide cases, respectively. Only catastrophic circumstances could halt the advance of the Athenian democracy, and those circumstances came in the form of Macedonian monarchical rule imposed on Greece in 322, followed by the advance of the Romans who snuffed out all vestiges of democracy within their conquered territories.

For all its positive features, Greek democracy still had its weaknesses. The greatest weakness was the fact that Greek democracy was

direct, not representative, and participants had to be physically present at a vote to raise their hands to be counted. If one was a farmer with fields to tend, a soldier serving in the military, a merchant abroad for trade, or sick or elderly, attendance would be problematic. Typically only the wealthy aristocrats, who had slaves to attend to their businesses and lands, could be present at most of the votes. There was also the issue of franchise. Only male citizens were eligible to participate in the democracy, which left 85 percent of the population disenfranchised, including women, metics (resident noncitizens), and slaves. Ostracism, developed to support democracy, in practice served to stifle opposition. Regardless of its drawbacks, Athenian democracy lasted from 500 BCE to 322 BCE, and during that period it served as the world's first and only example of a functioning direct democracy.

Greek Writing on Governance

Ancient Greek discourse on high politics and governance appears not only in the writings of philosophers such as Plato and Aristotle but also in that of historians and dramatists. Many of these writings focus on the establishment of a perfect government form amid a world of chaos and human failings. However, they also recognize that human liberty, as interpreted by the ancient Greeks, necessitates a certain degree of freedom (at least for men) and a degree of political participation by the population. However, in consideration of multiple interests that derive from Greek society due to political participation in the polis (Greek city-state), there is a need for a government structure that can impose its will for the benefit of all. Greek historians like Thucydides and Herodotus offer their perspectives on the failings or successes of governments through their works; dramatists such as Aristophanes also offer nuanced criticism of politics and governing structures. In contrast, philosophers such as Plato and Aristotle suggest models of government that create greater stability amid the chaos of everyday life, according to their respective philosophical perspectives.

Greek historians Thucydides (ca. 460–ca. 395 BCE) and Herodotus (ca. 484–ca. 425 BCE) discuss Greek government in their work, typically in the context of warfare. Thucydides' *History of the Peloponnesian War* discusses the importance of political entities drawing their relations from a position of military strength. Furthermore, while he approved of Athenian statesman Pericles and his leadership, Thucy-

dides remained skeptical of the concept of democracy and the excesses that it allowed for demagogues. Therefore, he was critical of democracy in its allowance of social chaos within the city-state, necessitating strong leadership. However, this leadership, ironically, was a threat to Greek democracy. In contrast, while Herodotus also wrote about high politics in his works, most notably in *The Histories* and *The Persian Wars*, he tended to be more supportive of Greek democracy than was Thucydides. In Herodotus's work, he wrote disapprovingly of the despotism associated with Persia while exalting Greek democracy as encapsulated in Athens.

Greek drama also incorporated political themes as integral elements. Tragedies such as Sophocles' *Antigone* (ca. 442 BCE) and Aeschylus's *Seven against Thebes* (ca. 467 BCE) included various political themes that represent the paradigms that existed in Athenian society in regard to governance and citizenship. *Antigone*, in particular, discusses such political themes as the control of the state in the lives of individuals, the conception of law in the lives of individuals, and the duties and responsibilities of citizens to the state. Greek playwright Aristophanes' play *Ecclesiazusae* (ca. 390 BCE) also discusses politics in the context of his satirical criticism of egalitarianism in Athenian democracy. In this play, women under the leadership of Praxagora convince the male citizenry of allowing them to rule Athens. They thereby institute an egalitarian form of government that abolishes property and marriage as well as decreeing that all people share equal status by law. In this context, this comedic play was a warning against excessive democracy, which was of concern to some elites in Athenian society. *Ecclesiazusae* also represented ancient Greek patriarchal views of women in perceiving them as incapable of asserting any viable or responsible political agency in greater society.

Greek philosophers wrote about ideal forms of political structures in governing society, based on their philosophical ideals and the viable realities of their respective eras. Writings on rhetoric imparted a high value on providing viable argumentation as a valued skill of not only politicians but also citizens of the polis. Most notably, the works of Plato and Aristotle have had the most

➤ PERICLES' FUNERAL ORATION—ON ATHENIAN DEMOCRACY

Notable Greek statesman Pericles exalts Athenian democracy in this funeral oration, delivered to the Athenians after a year of fighting the Peloponnesian War (431–404 BCE). The following excerpt was recorded (and according to historians probably embellished and polished) by Greek historian Thucydides. This type of discourse was common in the descriptions of Greek governance by historians of antiquity.

“Our constitution does not copy the laws of neighboring states; we are rather a pattern to others than imitators ourselves. Its administration favors the many instead of the few; this is why it is called a democracy. If we look to the laws, they afford equal justice to all in their private differences; if no social standing, advancement in public life falls to reputation for capacity, class considerations not being allowed to interfere with merit; nor again does poverty bar the way, if a man is able to serve the state, he is not hindered by the obscurity of his

condition. The freedom which we enjoy in our government extends also to our ordinary life. There, far from exercising a jealous surveillance over each other, we do not feel called upon to be angry with our neighbor for doing what he likes, or even to indulge in those injurious looks which cannot fail to be offensive, although they inflict no positive penalty. But all this ease in our private relations does not make us lawless as citizens. Against this fear is our chief safeguard, teaching us to obey the magistrates and the laws, particularly such as regard the protection of the injured, whether they are actually on the statute book, or belong to that code which, although unwritten, yet cannot be broken without acknowledged disgrace.”

—Abraham O. Mendoza

Thucydides, *History of the Peloponnesian War* (New York: Penguin Classics, 1954), Book 2.34–46.

resonance of Greek political philosophy. Plato wrote extensively on the ideal form of government in his two main works on the subject, *Republic* and *Laws*. In *Republic*, Plato discusses how man's ability to control his existence is akin to the function of state governance. According to Plato, a rational man is analogous to a state administered by a philosopher-king, for the benefit of the citizenry, while an irrational man is like a city-state run by a mob, subject to chaos. In *Laws*, Plato discusses the organization of an ideal political body, taking into consideration such factors as education and the makeup of the population. Aristotle's main work on politics, aptly titled *Politics*, discusses the origins of the state, economics and trade, the constitutions of city-states, citizenship, democracy, oligarchy, and education, among other subjects related to state administration. Through his thorough analysis of political structures and governance, Aristotle attempted to decipher what is possible amid the realities of classical Greek society, offering a more empiricist perspective than the idealistic models espoused by his mentor Plato.

Political philosophy in the Hellenistic period of Greek history extended primarily to writings by Stoic philosophers. Ethical concepts espoused by Stoic philosopher Zeno (ca. 334–ca. 262 BCE) were imparted to the responsibilities of the citizens to the state and the reciprocal relationship that the state held to the citizen. Virtue and reason were held to be crucial in the functions of the daily lives of individuals and politics, without which quotidian existence would be ruled by chaos. Stoic philosophy was significant in shaping later Roman and Christian beliefs regarding political administration and conceptions of the role of the citizen.

■ Introduction: Rome—from Monarchy to Republic to Emperor

When most people think of ancient Roman politics, the absolute power of the emperor is the first thing that comes to mind. In fact, Roman political organization varied considerably over the nearly 1,500 years of Rome's existence. The stories of Rome's founding suggest that the earliest government of Rome was that of a monarchy and that the founder of Rome (Romulus) ruled as king. Although scholars are divided on how much of these early accounts are historically accurate, no one doubts that the first government was led by a king, and thus this stage of Roman history is referred to as the Regal period. This monarchical state seems to have emerged within the context of the Etruscan city-states, which predated Roman civilization, but the exact relationship between early Rome and the Etruscans remains debated by historians.

The Regal period, according to tradition, extended for the reign of seven kings. The final king was expelled from Rome, and the republic—a type of government somewhat akin to Greek democracy—was declared. Under the republic, Roman authority expanded through Italy and eventually through Greece, western Europe, North Africa, and the Near East. Eventually the republican form of leadership became too unwieldy, and Julius Caesar seized control. Caesar's control over Rome did not last; he was assassinated by a group of senators. However, the return to the republic was short-lived, and after a series of political machinations and open warfare, Augustus gained absolute control over the Roman empire, and power became centralized in the figure of the emperor.

—Kevin M. McGeough

Formation and Development of the Etruscan City-States

The culture and politics of the Etruscan city-states were predominant in Italy from the end of the Iron Age Villanovan culture until the rise of Rome in the fifth and fourth centuries BCE, al-

though little is known about their formation and the relationships between them due to the lack of a large corpus of primary texts. Generally, Etruscan politics were structured as a large urban center that maintained individual control over its dependent region and was allied with other urban centers overall by cultural factors and, at times, by political arrangement.

While debate has ranged over the origin of the Etruscans, there is little evidence to support a cultural break from the Villanovan civilization. The Etruscans did choose to found many of their regional urban centers on the site of well-established former Villanovan habitations. In the eighth century, a period of rapid growth caused by the increased demand in trade converted the villages into pre-urban centers, allowing for more social stratification and specialization. However, the regions of Etruscan civilization each developed at a slightly different pace, with various emphases on political and cultural themes until the end of the sixth century BCE.

The major Etruscan cities were distributed between the Arno and Tiber rivers, focusing their population and wealth within central and southern Etruria. Northern Etruria—from the Arno to

Ruins of the Etruscan city of Veii in present-day Italy, seventh–sixth century BCE. (SEF/Art Resource, NY)

the Po—and the Etruscanized region south of the Tiber and into Campania comprised the remainder of their territory. Southern Etruria and Etruscanized Campania demonstrate advanced cultural and political development earlier, while the other two regions adopt similar patterns at slightly later dates. The dominant urban centers in each region were Mantua, Atria, Spica, and Felsina in the north; Felathri, Arretium, Curtun, Perugia, Clevsin, Fufluna, and Vetluna in central Etruria; Velzna, Velch, and Tarchna in the south; and Caisra, Veii, and Rome in the northern Campanian region. Each major center was surrounded by a variety of smaller urban settlements as well as agricultural land, all of which was militarily dependent upon the major city.

In the eighth and seventh centuries BCE, archaeological evidence suggests that the Etruscans were primarily oriented toward trade and seafaring, with many descriptions of Tyrrhenian pirates surviving in later Latin and Greek literature, indicative of a simplistic political system for Etruscan culture similar to the marauding kings whom Homer describes in the *Iliad*. Local hereditary kings (*lucumoni*) ruled by force of power and personality and made their own international arrangements with Carthaginian, Sicilian, and Greek contacts. Lucumoni maintained authority only over their city and its surrounding region but would negotiate alliances with other local kings for military purposes. This is the period in which Rome was ruled by the Tarquin dynasty and in which Etruscan civilization first begins to adopt cultural practices from the influence of Greek colonies in southern Italy, Sicily, and the northern Tyrrhenian coast.

After the Orientalizing period in the seventh century BCE, the evidence shows that the Etruscan political system is still dominated by the lucumoni, likely including both religious and military leadership. However, by the beginning of the sixth century BCE it is an elected position, but there is no indication about which classes of Etruscans would have voted. Dionysius of Halicarnassus describes the regalia of the king as including a purple robe, an eagle-topped scepter, and a portable ivory chair. He was also preceded in public by a magistrate carrying the *fascēs*, an axe bundled with rods, to symbolize his power to punish and execute. This idea of kingship

seems to have lasted into the period of Roman expansion, perhaps terminating around the end of the fifth century BCE as Roman culture began to spread northward.

Livy and other early historians argue that the Etruscans developed a *concilium Etruriae* in the Sanctuary of Voltumna (Fanum Voltumnae), which the leaders of the 12 most important cities attended. It is extremely difficult to ascertain membership within the League of Twelve cities, as there are more than 12 possible urban centers. It is also likely that membership shifted over time, connected to the economic and military fortunes of the individual cities. This gathering included an important festival, as the main connection between these urban centers was a cultural one. Here, the leaders would elect a *praetor Etruriae* to oversee the entire Etruscan sphere. The details and context of this position are not well understood, and hypotheses range from just a designated title to an active role primarily focused upon religious aspects and the organization of the yearly *concilium Etruriae*. Dionysius also relates a joint command of Etruscan military forces as a result of this meeting, noting that the *fascēs* of the 12 cities were handed to one individual, but it is not likely that this was a regular occurrence.

While little can be said with certainty about the Etruscan political structure, it is clear that after contact with the Greeks it was based upon kingly elections in each urban center and may have included a Pan-Etruscan council. The change in governmental style allowed the Etruscans to expand their trade and exhibit their culture throughout the western Mediterranean. Their political symbols were influential upon the Roman republican state, with the use of the *fascēs* and magisterial chair continuing for elected leaders and the eagle as a state emblem. The model of the *concilium* is either replicated in Roman politics or retrofitted to the Etruscans by Latin historians.

Regal Period in Rome

Much of what historians know about the Regal period in Roman history (753–510 BCE) is based on commentaries written by historians later in the subsequent Roman republic and from archaeological evidence gathered in the past century. While to some historians of antiquity this evidence suggests the Etruscan origins of the city of Rome, others argue for an independent origin on the part of Latin migratory groups. While much of the work done by ancient Roman historians, such as Livy and Emperor Claudius, focuses on the mythical foundations of Rome and its experiences with the institution of kingship, some of their data can also be interpreted as a reliable source in discussions of the early Roman relationship to the Etruscans and the purported development of Roman republican institutions such as the Senate. However, since much of this material is imbued with mythological connotations, many dates and persons are deemed fictional by scholars of the period.

Evidence suggests that the development of the Roman city-state was akin to the establishment of adjacent Etruscan settlements, most notably those centered in ancient Tuscany (Etruria). The mythological stories about the foundation of Rome also hint at Roman interaction with their Etruscan neighbors. Sources from later periods of Roman history designate as the first king of Rome the mythological Romulus, who founded the city in 753 BCE. The subsequent six kings—many of whom are thought by historians to be mythological—represent important figures in the development of Roman institutions that would later become integral parts of the republic. Kingship during the Regal period was not hereditary; kings were selected by elites from top government officials who had served the previous king. Historians have attempted to piece together relationships between the multiple kings

THE RAPE OF LUCRETIA—ROMAN STATE-FOUNDING MYTHS

The mythology of the foundation of the Roman republic centered on the fall of Tarquin the Proud and his association with the rape of Lucretia as illustrative of the corruption of the institution of kingship. She was the wife of Tarquin's nephew Collanitus and allegedly was raped by Tarquin's son Sextus. Lucretia was the typical virtuous Roman woman, dutiful and loyal to her husband. She committed suicide rather than live with the shame of rape, thereby illustrating her Roman female virtue. Popular discontent over this episode resulted in widespread rebellion against the tyrannical rule of Tarquin, whereupon the Tarquins were expelled from Rome and the republic was established. While evidence suggests that the story of the rape of Lucretia is mythical, the story itself is illustrative of Roman values and expectations of women, thereby showing the value of myths as a way to extrapolate societal mores.

—Abraham O. Mendoza

using sketchy evidence from mythological texts, which has proven to be problematic.

Following the rule of the eponymous Romulus, the six kings of Rome are assumed to come from ethnicities (Latin, Sabine, or Etruscan) other than specifically Roman. This suggests to some historians that Rome was a complex multi-cultural society rather than a specific Latin-based one. The influence of Etruscans in the Roman Regal period has proved to be another contentious issue, based on what can be extrapolated from ancient written sources. Etruscan rule of Rome is interpreted by historians from surviving manuscripts. According to some accounts, Tarquin I (Tarquinius Priscus) the fifth king during the Regal period, introduced Etruscan culture to Rome. However, some historians suggest that perhaps the link made by ancient historians about Etruscan influence is based on a desire to create a linkage between the origins and development of Rome and adjacent Etruscan civilization.

The development of Roman republican institutions has also been attributed to the Regal period, mostly as innovations by the kings to

create more efficient means to administer through the inclusion of elites. The development of the Senate, attributed to the third king, Tullus Hostilius, is one of the most notable of these institutions that Roman scholars during the republic attributed to an earlier period.

However, it is likely that these are merely mythological origins given to political structures whose establishment was perhaps unknown to these later historians constructing Roman history, who imparted their own contemporary values on a little-known past.

The last king of the Regal period, Tarquin the Proud (Lucius Tarquinius Superbus), is alleged to have assassinated the prior king to usurp the throne. Tarquin's abuse of power and supposed tyranny led to a rebellion that resulted in his overthrow and the establishment of the republic in 510 BCE. Evidence suggests that major changes in the governing structure did occur during this time and that the institution of kingship was replaced by a more inclusive republican form of government run by elites. Nonetheless, much of the history of the Regal period remains enigmatic and mythological, and thus historians must tread lightly on taking the overly patriotic Roman republican historians' words at face value.

The Fall of the Monarchy and the Rise of the Republic in Rome

The archaeological record of the period suggests that the site of Rome expanded in the mid-seventh century, becoming more heavily urbanized. This is consistent with other sites in the region. Larger, more urbanized sites are often associated with the rise of what has been called the city-state system. This was the major organizational system of the Etruscans as well. The city-state usually consisted of a large settlement, with a defensive position and communal areas within the city itself. Cemeteries and farmsteads were outside of the settlement proper. Governance was local and centered in the city.

Theories of how the city-state came to be the dominant mode of settlement in Italy at this time are many. The fundamental difference among the various theories is the rate at which scholars assume that change occurs. Some suggest that city-states are founded all at once. Others

suggest that urbanization occurs gradually. Rate of change is a problem in historical and scientific fields in general (e.g., the debates surrounding Stephen Jay Gould's notion of punctuated equilibrium, which suggests that change occurs very quickly between periods of change and very long periods of stasis) and is not likely to be resolved anytime soon.

The archaeological evidence for city-state settlements and the historical evidence for the kings of Rome are consistent with each other. Although the details and personalities of the kings of the Regal period may not represent real historical personages, the institution of kingship within the context of a city-state form of government probably accurately describes the Regal period.

The beginning of the Roman republic coincides with the expulsion of the Tarquins from the city itself. With the forced exit of the Etruscan monarchy came the formation of the republican form of government. Whether or not the expulsion was an actual historical event at this stage, history can now be discussed more confidently.

Concomitant with the rise of the new form of government was the rise of an order of people known as the plebs (or plebeians). In contrast to the patricians (elite families who claimed descent from the original senators chosen by Romulus), the plebs were a heterogeneous group of underprivileged people who organized themselves into a collective political unit. In 494 BCE the plebs withdrew from the city of Rome (likely on account of mounting debts) and gathered on the Sacred Mount. There they voted to create their own governing body, the *concilium plebis*. This event, according to ancient historians, led to the codification of Roman law in the so-called Twelve Tables. These laws gave equality to all citizens but also formalized the differences between the two orders. Modern scholars often refer to the conflict between these two groups as "The Conflict of the Orders."

As Rome grew in size, it found itself in conflict with numerous neighboring Latin cities. These cities had banded together centuries earlier for shared cultic and religious purposes. With Rome's rise to prominence, this league of cities took on a militaristic aspect as well. Modern scholars refer to this organization as the Latin League, although it must be mentioned

that this was not a name used in antiquity. The exact nature of this organization is not well understood, nor is the sequence of events that led to war with Rome. It is clear that the Latin League went to war with Rome sometime after 504 BCE, and victory was gained by the Romans at the Battle of Lake Regillus in 499 BCE. The causes of the war were probably rooted in Rome's growing economic and military might.

Although Rome had been victorious in 499 BCE, relations between the two entities did not normalize until a formal treaty was agreed upon six years later. The *foedus Cassianus*, between Rome and the Latin League, was formed in 493 BCE, marking the end of the Latin War. Named after the Roman consul who was instrumental in its creation, the treaty viewed Rome and the rest of the league as equal partners, with Rome the only city able to call all of the cities to war. It established certain rights between the citizens and established a system of common defense. Spoils of war were divided, giving half to the league and half to Rome. The conditions of the treaty were preserved by a summary in the writings of Dionysius of Halicarnassus.

Perhaps some of the motivation behind the *foedus Cassianus* was the desire for mutual security. Migrations of people known as the Volsci, the Sabines, and the Aequi led to attacks by these peoples against Roman and Latin territory. Throughout the fifth century, Rome was forced to fend off attacks from these three groups and various others. It is difficult to determine, from the accounts preserved by Livy regarding this period, what were historical events and what were literary tales. It is clear that war prevented the region from gaining stability for the first half of the fifth century. Through the second half of the fifth century, however, the raids of the Volsci and Aequi became more infrequent, and those of the Sabines seemed to have stopped completely.

Governance in the Roman Republic

When the monarchy was driven out of Rome, the body of elders who advised the king remained in the form of the Senate. Senators were responsible for advising the two consuls (elected annually) on which legislation of the proposals submitted by the consuls should be submitted to the popular assemblies for voting. Although the Senate itself could not pass laws, it strictly controlled which legislation reached the assemblies and was therefore one of the most powerful political institutions within the republic. The Senate could also issue decrees that had the force of law if not an actual designation as law. The Senate was also responsible for governing the provinces, and senators were often sent as governors to the provinces. The Senate usually met at the Forum, in the northwest corner known as the Curia Hostilia. However, Senate meetings theoretically could be held in any public place within a certain distance of Rome.

It was especially important to have the support of the assemblies when running for a political position. Voting was organized by assembly. Eligible voters met with their assembly outdoors and voted there. In order to vote, the citizen had to physically attend the assembly and, by extension, had to be in Rome. It is difficult to know how many Italian citizens actually made the journey to Rome to vote after they gained the right in the Social War. Certainly this hampered the voting ability of many citizens who lived outside of the capital. Until 139 BCE, votes were cast aloud; after 139 BCE, secret ballots were used.

There were four different assemblies in the republican period: the *comitia curiata*, the *comitia centuriata*, the *comitia tributa*, and the *concilium plebis*. *Comitia* does not have the same meaning as the English word “committee.” It is better translated as “assembly.”

Dating from the period of the monarchy, the *comitia curiata* reflected the ancient tribal divisions of Rome. Each of the three tribes was divided into ten wards (*curiae*). In the republican period, this assembly ceased to have a practical function. Its role was ceremonial, conferring imperium on some elected officials. The *comitia centuriata* met in the Campus Martius (Field of

Mars). In the period of the monarchy, the *comitia centuriata* was organized into units of 100 men; this is where the name *centuriata* derives from. But throughout the republican period, the actual number of members varied greatly. At the Campus Martius, each century had its own meeting enclosure. During the monarchy it was a military assembly, but by the republic it had become a general assembly. There were 373 centuries. As with the *comitia tributa* (assembly of tribes), voters voted as a block, meaning that if the majority of votes within a century were “yes,” then that would be considered 1 “yes” vote and tallied along with the 372 other possible votes. The division into century was based on age and property value. Because there were fewer centuries of the poorer classes, the wealthier classes could vote as a block against the poor. At the beginning of the republican period this was the major assembly, voting on whether to go to war, electing magistrates, and acting as an appeal court for capital cases. As the republican period progressed, more and more power was in the hands of the *comitia tributa* and the *concilium plebis*.

The *comitia tributa* was the assembly of the tribes. The name derives from the division of voters into 35 tribes, based on the supposed origins of one’s ancestors and/or one’s own geographic origin. Voting occurred at the Forum in Rome, with basically the same system as the *comitia centuriata*, when summoned by a consul, praetor, or tribune. The function of this assembly was to vote for some magistrates, vote on some legislation (legislation put forward by a magistrate), and act as a court of appeal in noncapital cases.

The *concilium plebis* was structured as 35 blocks, and like the *comitia tributa* the plebeian assembly also met in the Forum, with participation restricted to plebeians. Established early in the republican period after 287 BCE, it made decisions that were binding on all citizens, not just plebeians. The actual power of this assembly depended on the mood in the Senate at the time. When the senators supported the *concilium plebis*, this group could be very influential. But when the group was not favored, the Senate could find ways to restrict its powers.

The magistrate was an elected governmental office in Rome. Two individuals filled each office; individuals holding the same office were called

Remains of the Forum of Augustus in Rome. Inaugurated about 2 BCE during the reign of Caesar Augustus, the Forum was a practical complex of buildings used for Senate functions and other civic and religious activities. (Phillip Minnis/Dreamstime.com)

collegae. Most of these positions were held for one-year terms. Once an individual had been elected a magistrate for the first time, that citizen was eligible to be a senator, a nonelected position. Magistrates held one of two types of power in Rome. The upper-level offices held *imperium*, which gave power in a military setting and the power to enact the death penalty. The *comitia curiata* theoretically granted *imperium*, but this was, practically speaking, a symbolic role. Lower-level magistrates held *potestas*, which was the power granted by their specific office.

Quaestor was the lowest level of magistrate and ideally the first step in the *cursus honorum*. A man could be elected quaestor at the age of 27 (true of most of the republican period) and at this time would be able to gain entry into the Senate. The number of quaestors varied along with the size of Rome’s external holdings. Serving a variety of functions, quaestors were responsible for both public records and the treasury. Outside of Rome, they were responsible for paying the army and administering finances for the governor.

There were usually four *aediles* at a given time, serving one-year terms. Elected by the *comitia tributa*, two were plebeians, and two were *curule* (officials with state authority). These individuals were in charge of much of the Roman infrastructure. From the maintenance and build-

► THE OFFICE OF DICTATOR IN THE ROMAN REPUBLIC

During a state of emergency, the Roman Senate had the power to nominate a dictator, who acted as supreme commander for six months, which was the length of time that war was engaged in during a year. The nomination of a dictator did not mean that other magistrates lost their powers. However, the dictator did gain complete control over military and judicial matters. Julius Caesar was the last dictator in Rome (until the twentieth century, at least).

—Kevin M. McGeough

ing of public works (e.g., aqueducts) to the regulation of weights and measures, the aediles kept the city of Rome running smoothly. Until the reign of Augustus, the aediles were also responsible for public games. This responsibility placed aediles in a very public setting and provided them with much exposure. Throwing expensive games was a sure way of attracting votes, so even though the position of aedile was not a mandatory position along the *cursus honorum*, it was a useful political stepping stone.

At least 39 years of age, praetors were judicial figures. With the initial dissolution of the monarchy, praetors took over responsibilities that had been the king's, including military power, although this office later came to be known as consul. As the republican period progressed, the military responsibilities of the praetors ceased, but they retained the power of *imperium*. Elected annually by the *comitia centuriata*, the praetors also issued an edict of law annually. The number of praetors varied, as did their jurisdiction. For example, the *praetor urbanus* was responsible for law within the city of Rome. These responsibilities somewhat overlapped with those of the *praetor peregrinus*, who dealt with foreigners.

The consul was elected for one year. The exact regulations concerning who was eligible for election to this office changed throughout the republican period. Two consuls served at a time; this acted as a check and balance on their individual authority. Citizens had to be 36 years old

(later 42 years old) to be elected consul. Until 150 BCE, consuls could not be reelected until a 10-year span had elapsed. After 150 BCE reelection was banned outright, although in fact many consuls were reelected after this ban. Nominated by the Senate, consuls were elected by *comitia centuriata*. The consul chaired Senate meetings and ensured that the decisions the Senate made were carried through. Primarily, though, the consul was the commander of military forces. In this role, the consul would lead the Roman military on foreign campaigns.

Censor was the highest position that could be held by a magistrate in a nonemergency situation. The office was held for an 18-month period and was elected by the *comitia centuriata*. The specific responsibilities of the censor made it a very powerful position in Rome. The censor registered all citizens, ensuring that they were classified properly for tax and voting purposes. He was also responsible for commissioning public works and the use of public land. As a moral authority in Rome, the censor could expel senators from the Senate.

Politics in the Roman Republic

After the expulsion of the Tarquin monarchy, the leadership of the state was invested in the office of *praetor* (later *consul*), which was held by two individuals, elected for a one year term. The praetors held symbols of leadership that were different from (although related to) the monarch's, but they did have the king's power of *imperium* (the power to command). Although the powers of the head of state were curtailed with the beginnings of the republic, the powers of the aristocracy grew. The gradual growth of aristocratic power led to what scholars call the "Conflict of the Orders." The conclusion of this conflict led to new powers for various institutions in the political life of Rome.

The Senate was composed of men who had once held an elected position as a magistrate. At the beginning of the republic the Senate was limited to 300 men, but by the time of Julius Caesar there were 900. Once the man's term of service came to an end, he became a senator and remained a senator for life, although he could be expelled for misconduct. Roman senators were nonelected officials serving life terms. These men were not paid for their work as senators, but it was an avenue through which prominent Roman families sought political gain. Indeed, participation in the Senate was a luxury of the wealthy. Because one had to have held office to become a senator, it was necessary to have amassed enough wealth to pay for an expensive election campaign. The interests of the Senate corresponded with the interests of the wealthy and well-established families of Rome. But class-based self-interest cannot be seen as the sole motivating force of the Senate. There were senators whose actions in government were based on ideals rather than on personal political achievement. And at certain periods, senators would work on behalf of the masses to sway their votes in the assemblies.

There were two main areas of civic life that were voted upon during the republican period. Citizens voted on legislation, and they also elected government officials. Legislation was never debated or discussed at an assembly, only voted upon. Roman citizens engaged in direct democracy, in which the voters themselves were in attendance at legislative assemblies.

Although the issues could not be discussed at the assembly, often a few days before the assembly was to meet informal meetings called *contio* were held. Anyone could attend these meetings, including foreigners, women, and slaves (although none of these categories of people could vote). Normally a *contio* was held to familiarize the general public with an issue that was to be voted on or to introduce the candidates for election.

After 180 BCE, the offices for which a citizen was eligible to run were determined by his age and which offices he had previously held. This was called the *cursus honorum* (the course of honors). The course of honors (in this usage the word "honors" is best rendered in English as

"political offices") was a legalized system, but occasionally an individual would advance ignoring these rules. Pompey's rise to prominence is an example of someone ignoring the *cursus honorum*. The ideal path was that a citizen would have spent at least ten years in a military or judicial position. After this period, he would be eligible to run for the lowest level of office—that of *quaestor*—and with usually a two-year interval between each office slowly progress to higher offices. Practically, the upper-level honors were dominated by a select group of powerful Roman families.

The Augustan Principate

Octavian returned to Rome in 29 BCE after reorganizing the eastern provinces that had been devastated in the wars of the previous years. At this time Octavian had tremendous power and controlled the military. He was extremely popular in Rome, and his victory over Egypt, which now supplied free grain to Rome, certainly aided this popularity. The Battle of Actium had left him in near-complete control, but he lacked a constitutional position. Calling himself "Emperor Caesar Augustus, Son of a God" (referring to his adoptive relationship to the now-deified Julius Caesar), he claimed to have restored the republic, but at the same time he had amassed near-absolute governing authority. It was Octavian's consistent use of republican terminology and public dedication to republican principles that made his power palatable to the citizens of Rome. He never took on the grandiose titles that Julius Caesar had used, nor did he take the position of dictator.

In 27 BCE, Octavian, in an infamous speech to the Senate, turned over his powers. This announcement had been carefully staged, and his supporters protested his resignation, claiming that Rome could not survive without Octavian.

The Ara Pacis Augustae (Altar of the Augustan Peace) in Rome, was built by order of the Roman emperor Augustus and dedicated in 9 BCE. The altar and walls of the shrine are adorned with floral motifs, representations of Roman legends, and scenes from its dedication ceremony. (Simone Manzoni/Dreamstime.com)

Octavian's response was theatrically reluctant, and he agreed to act as consul for ten years, overseeing the provinces of Egypt, Spain, Syria, and Gaul. Because these were the provinces where most of Rome's legions were based, Octavian had control of the military. In response to Octavian's "generous" sacrifice of power, the Senate bestowed upon him the name "Augustus," which means "revered one." From this point on, Octavian was referred to as Augustus. Even though Augustus's control was complete, he had learned from the example of the murder of Julius Caesar (his adopted father) that he required the support of the Senate to retain control. Referring to these acts in 27 BCE as "The First Settlement," Augustus claimed to have restored the republic. In fact, he had gained powers that at one time had been held by numerous offices and brought an effective end to republican government.

With these powers, Augustus left Rome for Gaul and Spain. He remained on the periphery of the empire until 24 BCE. From 27 to 24 BCE he accomplished military victories in Spain (the Cantabrian Wars), although he was not a particularly brilliant military tactician. He wrote his autobiography at this time, but it did not survive. The best records from this period are the writ-

ings of Dio Cassius. After falling almost fatally sick, Augustus apparently shifted his strategy for leadership. In 23 BCE he resigned his consulship. He gained the position of *tribunicia potestas* (tribune of the people) for life and gained *imperium maius* (power greater than all others). By virtue of his *imperium maius*, Augustus was de facto leader of the Roman empire.

In 19 BCE Augustus once again shifted the nature of his powers, having officially received consular powers for life. Scholars have debated the reasons for these periodic strategy changes. Were they attempts to combat problems, or were they opposition to Augustus? Or did they represent the growth and development of Augustus's understandings of proper governance? Whatever the case, after 19 BCE Augustus was in a position whereby his political power was no longer questioned. What was in doubt was who would take over supreme power after Augustus's death. The powers that Augustus had accumulated in his office were not hereditary, but neither was there a system of succession in place, as his position had been created on an essentially ad hoc basis. So although it was not constitutionally binding, Augustus made certain to indicate who he would designate as his heir.

The first individual who would be heir to the throne was Marcellus, nephew of Augustus. Augustus himself lacked a son, although his second wife, Livia, had sons from a previous marriage. But Augustus wanted an heir from his own bloodline (the Julian bloodline). His first wife had a daughter named Julia, so Augustus had Marcellus and Julia marry (25 BCE). This seemed like a clear statement of intent that Marcellus was the favored heir. However, in 23 BCE when Augustus thought he was dying, he handed his signet ring (the symbol of his power) over to his longtime friend Agrippa, not to Marcellus. Perhaps a power struggle would have ensued had Marcellus not died that same year. Agrippa had been a close friend and general to Augustus for many years and was the military intelligence behind him. In 21 BCE Augustus had his widowed daughter Julia married to Agrippa. They had five children, and Augustus adopted the three sons. By 12 BCE Agrippa's powers were fast approaching those of Augustus when Agrippa died unexpectedly of illness.

At this time, Agrippa's sons (adopted by Augustus) were too young to rule. So Augustus turned to Livia's sons from her previous marriage. The eldest of these sons, Tiberius, was forced to divorce his wife and marry the once-again-widowed Julia. Tiberius married Julia in 11 BCE, but because he was very attached to his now ex-wife, Tiberius was quite bitter. By 6 BCE Agrippa's sons Lucius and Gaius had entered public office but had proven themselves to be unworthy heirs. Augustus attempted to rein in their power by elevating Tiberius above them. Tiberius refused, left Julia, and exiled himself to Rhodes. However, by 4 CE Lucius and Gaius were both dead.

There were now three viable candidates to be Augustus's heir: Tiberius, Agrippa's surviving son Agrippa Postumus, and Augustus's great-nephew Germanicus. All three candidates were adopted by Augustus in 4 CE. Soon enough, Agrippa Postumus proved to be too volatile and was permanently exiled. This left Tiberius and Germanicus as the two possible candidates, with Germanicus the only Julian. When Tiberius adopted Germanicus, the problem was solved. When Augustus died in 14 CE, the office of emperor had become firmly established, but the method of succession had not been entrenched. Without a mechanism in place for providing incontestable succession, the identity of the next emperor would always be insecure. But the continued existence of the office itself was secure and would remain so for more than 300 years.

Politics in the Roman Empire

When Augustus became the first emperor of Rome in 27 BCE during the politically chaotic period that followed Caesar's death two decades prior, the Roman political system underwent a massive transformation. Authority was fully cen-

tralized in the figure of the emperor, who was emperor for life. Augustus modernized, clarified, and restructured much of the Roman political system. Through a series of carefully calculated steps, he built upon republican principles to centralize leadership in one personality.

The emperor was the supreme commander of the empire, with authority derived from popular support and, most importantly, his complete authority over the military. In Rome, the emperor's military authority was displayed through the Praetorian Guard. Popular support came from the holding of games, the presiding over of public functions, and a variety of other means. Imperial patronage curried and reinforced popular support. The emperor's role as a legislator must not be overlooked, because he was the main source of law. The emperor chose which of his sons would succeed him, and if he had no sons he would designate a successor by adopting him and declaring his adopted son the next emperor.

Theoretically, under the empire the Senate's powers were extended. Its decrees came to have the rule of law behind them and did not require ratification by a popular assembly. However, in practice the powers of the Senate were drastically reduced, beginning with the granting of increased powers to Augustus. He reduced the Senate—which had grown to more than 1,000 members—to 600 members. It remained at around this number until the last years of the Imperial period. Furthermore, Augustus added a property qualification. Individuals had to possess a certain amount of land before being eligible for senatorial service.

The Senate did retain a certain number of powers. It retained control over the state treasury, and individuals sent by the Senate governed some of the provinces. Certain legal proceedings were enacted in the Senate (usually proceedings that involved one of its members or an upper-class family). Various matters of infrastructure were controlled by the Senate, and the occasional foreign embassy was received. But for the most part, the Senate as a body had lost much of its power. Individual senators, however, could gain a great deal of power through their relationship to the emperor, although depending on the emperor this was not always a safe venture.

The emperor, technically, received his power as a gift from the Senate. Although Augustus and the first emperors after him attempted to demonstrate some deference (though only in speech) to the Senate, later emperors lost the sensibility that deference to the Senate was a political necessity. Indeed, as the Senate became increasingly less important as a political body, the disdain of the emperor only grew. Furthermore, the Senate lost much of its influence to the class directly below it, the equine. More and more, positions that previously had been senatorial jobs went to the equites, further undermining senatorial authority and power.

In the Imperial period, the *cursus honorum* (the established order of offices in increasing rank that ambitious Roman politicians would seek) grew even more, and the number of magistrates was greatly increased. Election to magistrate was no longer a responsibility of the comitia. This body ceased to have an effective function. Rather, the Senate gained control of the power to elect magistrates, many of whom came from senatorial ranks.

Magistrates after Augustus officially shared their power with the emperor. And the emperor had the power to appoint magistrates. This power was fundamental in retaining the emperor's absolute control over the Senate. The institution of the office of city prefect was an important imperial appointment to this end. The city prefect had many responsibilities that overlapped with those of the other magistrates, but his authority superseded that of all of the other magistrates. In many ways, these other magistrate offices became more honorific than politically effective.

One of the fundamental developments in the history of governance that occurred during the Imperial period was the transference of administrative powers from the hands of elected magistrates to nonelected government officials. At this time, a true institutionalized bureaucracy arose. Many of these new permanent bureaucrats came from the house of the emperor or from the equine class. Although technically the equine class was below the senatorial class, this group gained in power through the patronage of the emperor.

Augustus installed a standing army in the city of Rome itself that became known as the Praetorian Guard. This guard consisted of nine

cohorts of 500 men and acted as the emperor's personal military force. The Praetorian Guard enforced the emperor's will within the city of Rome and was under his direct control. Under normal circumstances, there were two commanders who wielded considerable power.

The Emperors of Rome

Much is known about the lives of the Roman emperors, and given the immense power wielded by these individuals, many played very significant roles in world history. What follows is a brief outline of the major groups of emperors who spanned the first 250 years of the empire.

The first five emperors (including Augustus) were of the Julio-Claudian family and thus are frequently referred to by their family name. With the death of Augustus, the imperial period can truly be said to have begun. Since Tiberius already shared a great deal of the powers of Augustus, the transition to Tiberius as emperor was a given. The transition itself was not particularly smooth. Whereas Augustus's feigned reticence to accept power had endeared him to the Senate, the same approach by Tiberius simply annoyed this political body. He has a bad reputation due to the writer Tacitus, who portrays him in a

shockingly negative fashion. Initially Tiberius attempted to allow the Senate freedom of action but became frustrated by its lack of ambition. Toward the end of his reign Tiberius had become increasingly paranoid about treason, and numerous treason trials engulfed Rome. Eventually Tiberius withdrew to the island of Capri, where he spent his last ten years.

As with Augustus, dynastic succession was complicated under Tiberius. While Tiberius was on Capri, Sejanus became the virtual ruler of Rome. This came to an end when Sejanus plotted against Tiberius's named heir, Gaius (Caligula). Sejanus and all of his supporters were killed. When Tiberius died his only heir was Caligula, who took the throne, becoming one of Rome's most notorious emperors. Caligula became seriously ill shortly after becoming emperor. Whether the illness was physical or psychological is unclear, but his later actions are not those of a well-balanced individual. After killing numerous possible rivals, Caligula depleted the treasury for massive spectacles (such as creating a bridge of ships across the Bay of Naples in 39 CE). His favorite racehorse dined with him and was dressed in the garb of emperors. Toward the end of his life Caligula declared himself a god and was said to have wandered about talking to the god Jupiter and the moon. Caligula's incestuous union with his sister Drusilla was looked upon with contempt. In 41 he was assassinated at the Palatine Games, an assassination with widespread support.

With Caligula's death, some members of the Senate had hoped for a return to the republican system. But when Claudius was discovered hiding behind a curtain of the palace, according to Josephus, he was quickly elevated to emperorship. Claudius was the son of Drusus but had some sort of physical disability that embarrassed the imperial family, so he had been kept out of public affairs. Claudius is most notable for his successful invasion of Britain and his poor judgment in wives. His third wife Messalina was notorious for killing her numerous lovers and rivals. In 48 she actually married one of these lovers (while still married to Claudius), an action that led to her execution. Claudius's luck with wives was just as bad with wife number four, Agrippina, daughter of Caligula. After having

secured position of heir for her son Nero, Agrippina poisoned her husband, Claudius. Nero, who had his mother killed after coming to power, was one of the most notorious emperors. His love of playing the lyre as accompaniment to the singing of songs he had written was also not well received. In 64 when a fire broke out at the *circus maximus* and engulfed Rome, people accused Nero of starting it. This is unlikely, and Nero did substantially deplete the treasury through relief measures, but the story that he sang a song while watching the fire consume Rome has long held great power in historical writings. Nero exacerbated his unpopularity by blaming the fire on Christians and persecuting members of this group. After a number of attempts, Nero was finally overthrown by supporters of a man named Galba who was declared emperor in Spain.

Galba was overthrown shortly thereafter. Two new emperors came in and out of power in quick succession until Vespasian gained control. Vespasian's accession to the throne inaugurated the second great hereditary line of emperors, the Flavians. The Flavians came out of the equestrian class and brought stability back from the chaos that had engulfed Rome after the uprising against Nero. Vespasian's reign was peaceful and stable. From a political perspective the same could be said for his son Titus's reign (79–81). However, breaking the stability was the eruption of the volcano Mount Vesuvius, which destroyed Pompeii and Herculaneum. When Titus died unexpectedly, his brother Domitian took the office of emperor and ruled during 81–96. Domitian was a capable but unpopular ruler. He was very afraid of conspiracies, and from 93 until his death he executed and banished people at will, based on his paranoia. Eventually realizing that they would all be killed, Domitian's wife and numerous high-ranking officials had the emperor killed, ending the Flavian control of Rome.

After the fall of the Flavians, there is a line of five emperors who had orderly successions and generally good relations with the Senate, hence their designation "The Five Good Emperors." Trajan, the second of these emperors, was the first emperor born in the provinces (Spain). Under Trajan, the Roman empire grew to its largest, pushing all the way to the Persian Gulf. Trajan

was also an energetic builder. His most impressive monument, Trajan's Column, still stands in Rome but has been adorned by a statue of St. Peter since 1588. Trajan's successor, Hadrian, gave up Trajan's Eastern conquests and solidified pre-existing borders. (Hadrian's Wall between England and Scotland is a remnant of this policy.) A lover of Greek culture, Hadrian traveled the empire. Before dying, he named Antoninus Pius as his heir, who was followed by his adopted son Marcus Aurelius as emperor. This emperor is most famous for his work *Meditations*, which still survives. Much of Marcus Aurelius's reign was spent in war, first with the Parthians, then with German invaders, then against Cassius the governor of Syria (who probably mistakenly thought that Marcus Aurelius was dead), and again against the Germans. The empire that had been solidified by Trajan and Hadrian had begun to fall apart. Plague hit Rome in 167 and lasted for at least 10 years. Before dying of illness, Marcus Aurelius named his son Commodus as his successor, the first successor linked by heredity in 80 years.

Historians consider the period after the death of Marcus Aurelius to be a time of decline for Rome. Up until this time Rome had been the center of the empire and the center of imperial power. After the death of Marcus Aurelius power shifted to the provinces, where centralized control was minimal. In addition, the Roman borders were almost continually under attack and gradually shrank. After a particularly unpopular reign Commodus died, resulting in a civil war. After a period of conflict the Severan dynasty came to power, the most noteworthy of which was Elagabalus, a 14-year-old Syrian boy who attempted to elevate a Syrian deity over Jupiter, much to the chagrin of the Roman populace. After he was assassinated, his adopted son Alex-
 andrius (Alexander Severus) came to the throne but was executed shortly thereafter.

The Decentralization of Rome under the Barracks Emperors and Reunification under Diocletian

For 50 years after the death of Alexander Severus, the Roman empire was beset with problems. At least 27 emperors were selected, most from the ranks of the military (hence the term “barracks emperors”), and most were killed, often by their own troops. Alongside of these 27 emperors were approximately 50 usurpers to the throne. Those emperors raised from within the military ranks were often the biological sons of the previous emperor. The armies frequently supported this kind of transition, as it ensured their continual payment. However, frequently enough the army would turn against its own chosen emperors.

The instability within the military led to a weakening of the empire’s defenses. Rome’s frontiers were besieged from almost every side (the Sahara proved to be an exception). Frontier battles were difficult, since frequently the emperor had to return his army to Rome to quell an internal uprising. The Franks and Alamenni (who would later become the French and Germans) attacked across the Rhine River. The Vandals and Goths attacked across the Danube River. These forces were the first enemy forces to kill a Roman emperor in battle (Decius in 251 BCE). And in the East, the Sassanian’s mighty army brought instability and became the first army to capture a Roman emperor in battle (Valerian in 260 BCE).

When news of Valerian’s capture was made known, two major provinces broke off from Rome and became independent. The Gallic province, supported by British and Spanish legions, declared independence and set up a capital at Trier. Independence was maintained until

274. Similarly, in the East, centered on the city of Palmyra, the Palmyrene province broke away until 274. These provinces were brought back under control by Emperor Aurelian in 274. Aurelian was a general who managed to quell numerous rivals to the throne and reunify Rome. He was dedicated to the worship of the Unconquered Sun, a popular deity within the army. The worship of this deity, in Aurelian's time, became a cultural phenomenon that united the otherwise very separate cultures in the empire. After Aurelius's murder, another six emperors would reign before Diocletian stabilized Rome.

Diocletian is often painted as a dark and evil emperor by Christian historians, in juxtaposition to Constantine who inaugurated Christianity as the official religion of the empire. Indeed, Diocletian did bring a revived intolerance for Christianity through edicts in 297, 298, and 304, which demanded that all soldiers and administrators offer sacrifice on pain of death (an activity prohibited by the Christian religion). Diocletian, who reigned during 284–305, restructured the Roman empire and restructured the nature of leadership. At a fundamental level, the nature of the emperor's mandate changed under Diocletian. The emperor was no longer the chosen of the people but rather the chosen of the gods, in particular Jupi-

ter. The new title that went with this was *dominus* (which means “master”), and an emperor's reign was no longer called a *principate* but rather a *dominate*. The origins of the divine right of European medieval kings to rule can be found in this philosophy of Diocletian's. Determining that the empire was too large to govern single-handedly, Diocletian installed Maximian as caesar of the West. Furthermore, to ensure a smooth succession, Diocletian and Maximian each adopted a caesar to assist in governance and to take over after their own deaths. Diocletian chose Maximianus, and Maximian chose Constantine. These four rulers became known as the Tetrarchy. Each ruler ruled from his own palace (none of which were in Rome). Diocletian engaged in massive building projects and reorganized the Roman governmental system. He retired in 305.

■ Introduction: Politics in India

The period from 1800 to 600 BCE in India is referred to as the Vedic Age, the period in which the Vedic texts were written and the religious traditions of Hinduism were born. At this time India was not governed by a sole ruler but instead was divided into numerous small city-states. Across India, society was rigidly divided by the strictly hierarchical caste system that would come to dominate Indian social life for centuries.

After the Vedic Age came to a close, India continued to be ruled as a separate series of city-states until the invasion of the Macedonian king, Alexander the Great, in 326 BCE. Alexander did not remain in India long, and after his departure

the region was divided into a series of larger competing kingdoms. The most powerful of these kingdoms was in the south, led by Chandragupta Maurya. By 322 BCE much of the south was unified under Chandragupta, and until its collapse in 185 BCE the Mauryan dynasty controlled much of the Indian subcontinent. It was the Mauryan king Asoka (304–232 BCE) who converted to Buddhism and sent Buddhist missionaries throughout Asia.

In 185 BCE a coup led to the collapse of the Mauryan dynasty, and the subcontinent was fragmented into a number of small kingdoms. By 230 CE an Indo-European group, the Kushan tribe, had conquered much of northern India, where

Buddhism continued to thrive. In the south, Hinduism remained the dominant worldview under the governorship of the Satavahana dynasty.

—Kevin M. McGeough

Mauryan Kings

The Mauryan dynasty was established in north India during the sixth century BCE. The center of action and power, as it has remained to the present day, was the so-called Aryan heartland (Aryavarta), the Gangetic plain. The battle for preeminence was reduced from many small states to four, with Magadha, under Bimbisara (540–493 BCE) and his patricidal son, Ajatashatru (493–461 BCE), becoming dominant. By 321, perhaps in part inspired by the example of Alexander of Macedon, who had arrived in northwestern India, Chandragupta Maurya, the founder of the Mauryan line, made Magadha the first empire in India, with its capital at Pataliputra (modern Patna), east of Banaras on the Ganges.

Chandragupta did not establish his empire from nothing, for he built upon the work of his predecessors. Bimbisara had expanded his rule through marriage and conquest and had established an administrative system and built roads. His successors had continued expansion through military conquest and built a strong army and an efficient land-tax system. Chandragupta took control by skillfully stepping into a power-vacuum left by the decay of the Magadha kingdom and the abrupt departure from northwest India of Alexander. He can certainly be given credit for starting the imperial dream and founding a strong government, albeit somewhat totalitarian and under the firm guidance of his mentor and capable minister, Kautilya (also known as Chanakya), author of a rather Machiavellian treatise on running government (*Arthashastra*). The empire was expanded by Chandragupta's son, Bindusara (297–273 BCE), and consolidated by his grandson, Asoka (273–232 BCE), described by the nineteenth-century British historian and novelist H. G. Wells as the greatest emperor the world has ever seen.

Asoka inherited a system that was essentially a police state. He also extended the empire until it covered a greater area than in any other time

Third-century coin depicting Chandragupta Maurya and Queen Kumaradevi. Chandragupta, founder of the Mauryan dynasty, was the first to unify India and serve as its emperor. (Scala/Art Resource, NY)

in Indian history. But after the last bloody battle, he experienced remorse and, also strongly influenced by Buddhism, renounced force (though not implied force) as an instrument of state policy. Concurrently, he developed the idea that the monarch had an obligation to his subjects. He exercised a policy known as *dhamma* (the vernacular for the Sanskrit term *dharma*, moral duty), described by the eminent historian Romila Thapar as a policy of paternal despotism and social responsibility.

Dhamma was a secular policy, not a religious doctrine, stressing social responsibility on the part of the subjects of the empire. It stressed mutual respect and moral behavior, based on human dignity, as the means for the smooth running of society, the basis for law and order. It was, in turn, the responsibility of the ruler to provide structure and policies geared toward the well-being of the people. The policy was expounded in a series of rock edicts and on pillars, and it espoused dhamma as replacing force for

the means of conquest. Though dhamma was an ethical concept, its purpose was clearly practical: to make a better society, and one easier to govern. Often and somewhat superficially labeled Buddhist, it owed considerably to the Hindu concept of dharma, for the key was not nonviolence so much as it was responsible social behavior. It certainly did not come out of a vacuum but was a culmination of a rising social and intellectual consciousness.

It should be pointed out that the empire had been conquered, so war was really no lon-

ger necessary, though it remained as a potential—but only to be used as a last resort (e.g., against unruly tribes). Aśoka's empire was united administratively and, equally as important, economically. Indeed, the administrative and economic unity was paramount; Aśoka resisted militarily campaigning in the south, allowing the four separate kingdoms there to go their own ways. After all, he had the hegemony on the subcontinent; the added territory would do him no economic good and would just be an administrative burden.

Unfortunately, dhamma disappeared with Aśoka. Indeed, with the death of Aśoka, political and economic decline set in and the structure soon collapsed. Politically, loyalty was geared to the king rather than to the system, which retained much of the inherent tension of a highly centralized administration. Just the logistics of running such a vast extent of territory (said to have been larger than that of Rome at its height) must have been technologically insurmountable. Further, there was no concept of nation or state: primary group identity was focused on village and caste. Without the leadership—in terms of charisma as well as ability—of an Aśoka, the structure may well have collapsed in on itself.

Within a century or so of Aśoka's death, northern India had entered a period of invasion, with the development of peripheral regional kingdoms (e.g., the Indian territory of the Kushans, part of a central Asian empire, first century CE). Nonetheless, considerable cultural development occurred, especially in terms of Buddhist thought and art, both indigenously and from outside influences. The Mauryan capital, Pataliputra, did not arise again as a center of power until 320 CE, although it should be remarked that much of the classical or so-called Golden Age of the Gupta dynasty had antecedents in the Kushan period.

Kautilya's *Arthashastra* (Manual on Administration and Politics)

The *Arthashastra* is an extraordinary treatise on statecraft, in 15 books and 150 chapters, traditionally written by Kautilya (also known as Chanakya), chief minister of Chandragupta, the

first Mauryan emperor. In it, Kautilya provides practical and imaginative advice on how ideally a king should organize, govern, defend, and expand his realm, being just and benevolent though prescriptive and watchful at home but aggressive and deceitful in his foreign policy.

Book 1 introduces the treatise's contents. Kautilya then argues that Dandaniti (the science of government) is the most important of the social sciences, particularly concerned with the appropriate use of legitimate force: a ruler must achieve a just balance between excessive severity, which excites revolt, and excessive mildness, which encourages contempt for authority. Book 1 continues with the education of a prince, the value of self-control, the importance of wise counselors whose advice the king heeds, and their selection and the use of spies to check their probity. It discusses the administrative work of the king's council; the role of envoys to foreign governments; how the king should ensure his personal safety, including protection against his wives and sons; the duties of a good king; and the organization of the harem.

Book 2, "The Duties of Government Superintendents," first considers the ideal human landscape: the form and distribution of settlements; the foundation of new villages to make unoccupied areas productive through agriculture, mining, and forest management; and the creation and layout of fortified cities. It then focuses on the bureaucracy: the duties of senior officials, such as collecting taxes, monitoring work, debriefing spies, and keeping accounts; detecting and punishing fraudulent or neglectful officials; and assessing the quality of goods for the royal treasury. It discusses how officials should monitor and manage industry; the mint; tax revenues; trade and forest production; the armory; weights and measures; toll collection; the agricultural productivity of Crown lands; game and butchery; taxing and protecting prostitutes and educating their children; shipping; the welfare of state-owned cattle, horses, and elephants; military matters, including chariot construction, training, equipment, and regimental organization; and passports and road security. It ends with recommendations on tax assessment, recruiting spies to observe people throughout society, and a city superintendent's various duties.

➤ WHO WROTE THE *ARTHASHASTRA*?

Did Kautilya really write the *Arthashastra*, as he claims in Book 1? Opinions among scholars are divided.

The political landscape and many things mentioned in the treatise closely match what is known of the Nanda-Mauryan period from other literature, Asokan inscriptions, and archaeology. In discussion of various viewpoints, Kautilya's is always last and decisive. Many scholars therefore support the attribution to Kautilya, arguing that some apparent anachronisms and alterations in viewpoint can be explained as interpolations and alterations by later commentators.

Others, however, find these discrepancies more significant and argue that the text was compiled later, perhaps by Vishnugupta, named at the end (alternatively, this is another name for Kautilya). Thomas Trautman undertook a detailed computer-based statistical analysis of the text, revealing stylistic inconsistencies that imply multiple authorship. He considers that the author was a later scholar, working perhaps around 250 CE, who brought together a number of earlier treatises, abridging but not otherwise altering them.

It seems probable that the core of the work derives from Kautilya. The main question is the degree to which it has been reshaped by later scholars.

—Jane R. McIntosh

In Book 3 Kautilya discusses all aspects of the law: legal agreements and the settlement of disputes; marriage and inheritance; property, land disputes, and agriculture; debt and financial affairs; slavery and employment relations; theft; defamation; assault; state regulation of gambling; and a range of offenses. He offers guidance on proper legal procedures; individuals' legal rights and duties, including provisions to protect slaves from ill-treatment; and appropriate punishments, generally fines but also public humiliation, banishment, mutilation, or death.

Book 4, titled "Removal of Thorns," is concerned with ensuring public order and welfare. It discusses the regulation of work and employment; commerce and protection against commercial deception; provisions for averting natural hazards, including preventing famines by "thinning the

rich" (taxing them heavily); crime prevention, including using spies as *agents provocateurs* to entrap would-be criminals; methods to identify the cause of suspicious deaths; the legal use of torture and when it is not permitted; the indispensability of reliable evidence; and the punishments for many crimes.

Book 5 discusses ways of preventing treason, including underhanded secret measures to get rid of untrustworthy ministers. Kautilya recommends salaries for state posts and considers how to raise emergency revenue, such as through public donations, using spy donors to inspire generosity and shame those backward in giving. He then discusses what makes a good courtier, including advising the king well; counselors should also conceal a king's terminal illness or sudden death until the heir-apparent is fit to take over.

Book 6 takes a closer look at the virtues required of the king. It then discusses foreign policy: in principle, all neighboring states are natural enemies, against whom more distant states are potential allies. Book 7 develops this theme, discussing situations favoring policies of peace, alliances, neutrality, deterrent war preparations, and war itself, aiming always to benefit the king's own state. For example, weaker states should be attacked; alliances should be made with stronger kings and broken when circumstances change. Kautilya discusses how a king may break up alliances against him; discusses how to defeat a powerful enemy by creating alliances, encouraging tribal raids or other stratagems; and in the last resort advises flight or negotiation rather than a heroic death. Finally Kautilya discusses making and breaking peace: the security of oaths, the selection of expendable hostages, and ways to engineer one's hostage's escape.

Book 8 considers how to deal with disasters. Kautilya shows the interdependence of the king, his ministers, and his people. The king is responsible for appointing suitable ministers, ministers for ensuring that everything is properly run, and the people for working to create wealth and maintain defenses; thus, disasters in one sphere will have repercussions in others. Kautilya examines potential sources of problems, such as defects in the king's character, natural

disasters, inappropriate behavior by officials, robbers and wild tribes, and mismanagement.

Book 9 returns to international relations, arguing that in achieving conquests, skill in intrigue is more effective than power or enthusiasm. Kautilya considers the factors involved in planning and executing a campaign, including terrain, timing, and military strength. He discusses the desirable size and composition of the army, its equipment and training, how to avert treachery at home or external threats while in the field, and how to assess the advantages and disadvantages of military action. Book 10 concerns the practicalities of warfare, such as routes, encampments, and provisioning; when, where, and how to attack; the disposition of infantry, cavalry, chariotry, and war elephants; various strategic formations; and the army's command structure. The single chapter of Book 11 returns to the subject of intrigue, describing ways to suborn or destroy the corporations of enemy states.

Book 12 considers how a king may make the best of submission to a more powerful enemy: on the one hand, by placating him with gifts of men, wealth, or lands, using the opportunity to off-load unreliable troops, uncontrollable horses or elephants, unsaleable goods, or land threatened by other enemies; on the other, by undermining the enemy's power by intrigue, such as using spies to create dissension, encouraging guerrilla warfare, and provoking attacks on the enemy by other states. Kautilya also describes ways to murder or capture the enemy ruler, and if all else fails, how the king may make his own escape.

Book 13 is titled "Strategic Means to Capture a Fortress." Initially the king should foster belief in his own powers and the gods' favor toward him, heartening his followers and discouraging the enemy, undermining the standing of the enemy king, and planting spies to create dissension in the enemy's court. When an enemy is safe in his fortress, other states should be encouraged to lay waste to his lands while the king destroys the enemy's trade, industry, and agriculture. Only when the enemy's resources are thus reduced should the king attack the fortress, using siege engines, men, and fire; tempt the enemy out by pretending to lift the siege; and send spies to infiltrate the fortress. Once the king

has conquered the enemy lands, he must win over its population by his generosity and good governance.

Book 14 considers secret means to rid the kingdom of wicked individuals: for example, using spies to poison them or set their houses on fire. Kautilya discusses various concoctions and their uses, including medicines, coloring agents, and potions to protect the army or cause harm to the enemy; some are accompanied by rituals.

Book 15 rounds off the work with a description of its form and the various ways its contents are presented, ending with justifications for its compilation: rescuing political science after Nanda misrule and the inadequacies of other scholars' commentaries.

Governance after the Collapse of the Mauryan Empire

The Mauryan empire reached the height of its power and grandeur under Emperor Aśoka. Aśoka's successors, however, were not as adept as he at holding together such a vast and internally diverse empire. The Mauryan empire weakened and fragmented relatively quickly and collapsed completely within 50 years of Aśoka's death. In 185 BCE the last of the Mauryan emperors, Brihadratha, was assassinated by his general, Pushyamitra Shunga.

The Shunga dynasty, which succeeded the Mauryas, never reached the extent of the Mauryan empire at its height. The Shungas were dominant mainly in the central part of the Ganges River valley.

The Shungas were Brahmins and seem to have had a negative view of Buddhism. Buddhist chronicles claim that the Shungas persecuted

the Buddhists, destroying temples and monasteries. Some scholars suspect that these accounts are exaggerations, reflecting not so much an active persecution as the fact that Buddhists no longer held the position of favor that they had under the Mauryas, especially Aśoka. On the other hand, there is archaeological evidence that some Buddhist monuments and monasteries fell into a state of disrepair during this period, and later renovations carried out upon them may have been to repair damage inflicted by the Shungas.

One reason the kingdom of the Shungas never rose to the level of prominence held by the Mauryan empire is that Pushyamitra Shunga's successors, like Aśoka's, did not have their forefather's ability to hold together and administer a large and internally diverse realm. The Shunga kingdom was eventually divided into feudatory states, which held nominal allegiance to the Shunga monarch but were largely autonomous in their day-to-day administration.

Another reason the Shunga kingdom did not rise to the level that the Mauryas did was a series of invasions from the northwest. The first group to seek to take advantage of the power vacuum left by the fall of the Mauryan empire was the Indo-Greeks. These were the descendants of Alexander's armies that had invaded northwestern India prior to the rise of the Mauryas. The Indo-Greek kingdom of Bactria, located in what is now northeastern Iran and Afghanistan, sought to expand farther into Indian territory. As the name "Indo-Greek" suggests, the cultural practices of these people were drawn from both Greek and Indian sources. At least one Bactrian king, Menandros (known from Indian sources as Milinda), practiced Buddhism. The famous Gandhara style of Buddhist art is drawn from this culture, an art style that in content is Indian, depicting the Buddha and various events from the Buddha's life, but in its mode of presentation is Greek, with the same realism in the depiction of the human form that one finds in statues of Greek gods in the eastern Mediterranean region.

The Bactrians were overthrown by the Parthians who, in turn, were overthrown by the Shakas, or Scythians. All of these groups managed to make major inroads into Indian territory, sometimes as far south as the Deccan plateau.

Subsequently, a central Asian tribe known as the Kushanas managed to conquer much of Central Asia and a substantial portion of northern India. However, their realm would also eventually disintegrate, being broken up into smaller political units until the rise of the Gupta dynasty around 320 CE.

The Kushan Dynasty

A number of dynasties rose and fell in northwestern India between the fall of the Mauryan empire (185 BCE) and the rise of the Gupta empire (320 CE). One such dynasty was that of the Kushans, who were a power to be reckoned with during the first two centuries CE. They were one of the five branches of a nomadic central Asian people, the Yueh-Chi, who lived on the western frontiers of China with another large group called the Hiung-nu. Periodic battles over lands and scarce resources in the harsh environment of the steppe characterized the relationship between the Yueh-Chi and the Hiung-nu. By the first century BCE the Yueh-Chi ceded their lands to the Hiung-nu and were forced to move farther west and southwest toward Bactria, a part of Afghanistan that lies between the Oxus River and the Hindu Kush Mountains. After defeating another group from central Asia, the Shakas or the Scythians, they established their roots in Bactria-Afghanistan and gradually transformed themselves from a nomadic into a settled and sedentary people. Sometime in the second quarter of the first century CE the Kushan chief Kajula Kadphises not only united the five branches of the group but further established a powerful kingdom centered in Bactria and extending to parts of Afghanistan. Under his successors Wima and Kanishka, the dynasty prospered, and from its capital at Purushapura

(modern Peshawar), it ruled over a great empire stretching from the Aral Sea, covering a large area of central Asia, Afghanistan, Kashmir, Punjab, and down into central India, reaching up to the gates of the old Mauryan capital of Pataliputra.

Initially foreign to India, the Kushans gradually learned to adapt to and absorb Indic cultural and religious values. The personality of their most remarkable ruler, Kanishka, symbolizes this transformation. Historians are not entirely sure about the exact dates during which he ruled; it could be any time between circa 78 and 147 CE. But leaving aside arguments of chronology, there is enough historical testimony from archaeology, numismatics, and Chinese documents to establish his lasting fame. His gold coins give us an idea of both the territorial expanse of his empire and the multifaith world of India and central Asia. Under his well-organized administration there lived people who followed a variety of beliefs: Persian Zoroastrianism, Greek and Roman paganism, Buddhism, Chinese Confucianism, Jainism, and numerous Hindu Vedic traditions. Appreciating the broad Indian tradition of social and religious tolerance, Kanishka gave space to differing cultural values and ideas. For Buddhists, however, Kanishka remains a figure as important for the development of their faith as King Aśoka (ca. 269–232 BCE) of the Mauryas. This was because Kanishka was an active patron of Buddhism. He called a great Buddhist Council to resolve differences among their

scholars, built many *stupas*, and supported Buddhist monasteries. Both under him and the Kushan dynasty generally, two great schools of art—Gandhara and Mathura—produced some of the finest sculptures of the Buddha, using both

➤ MERCHANTS AND MISSIONARIES OF THE KUSHAN ERA

The strategic location of the Kushan state between India and China provided Indian merchants with greater opportunities as middlemen in the Silk Roads trade between China and the West. The Chinese emperors, concerned by the tension between Rome and Parthia (Iran) resulting in Parthian impediments to the free flow of goods through their territory, permitted Indian merchants to transport the silk destined for the Roman market to the port of Barbaricum on the Sind coast. From there the Roman ships carried away the silk and left behind goods such as silver, topaz, coral, or glass, which too were handled by the Indian merchants on their overland route to China.

These merchants, individually or in guilds, established themselves in such places on the Silk Roads as Kashgar, Yarkand, Khotan, Turfan, and Miran. To these outposts of Indian commerce also came Buddhist missionaries from India to establish monasteries and teach Buddhism to the central Asians and the Chinese. As Buddhism spread in these lands, the demand for Buddhist artifacts from India greatly increased. Both China and the Kushan state earned revenues from levies charged on goods moving through their territories.

—Burjor Avari

the Greco-Roman and Indic styles. A headless statue from Mathura, possibly of Kanishka, demonstrates the vitality of Kushan art.

The atmosphere of calm and tolerance that prevailed under the Kushans was also greatly enhanced by the general material prosperity that came about through India becoming the hub of international trade by land and sea. This trade continued for a few more centuries, even after the Kushan dynasty had disappeared owing to pressures from both the new Persian Sassanian dynasty and minor Indian principalities. By 226 CE, the Kushans became minor vassals of King Ardashir of Persia.

The Satavahana Dynasty

During the first century BCE two particular regions of the Deccan plateau of India that had once formed part of the Mauryan empire—northwestern Maharashtra and the lands of Andhra between the rivers Godavari and Krishna—came to be controlled by a regional family known as Satavahanas, sometimes also called the Andhra dynasty. The power of the dynasty was consolidated by one of its early kings, Satakarni; for nearly a century after him, however, his successors had to concentrate only on Andhra and the eastern Deccan, having lost Maharashtra and the western Deccan to the Shakas who originally came from central Asia. Evidence that the Shakas were ultimately defeated comes in the form of remnant coins from the Nasik dis-

trict of Maharashtra that have their original Shaka images overstruck with the Satavahana images. The dynasty lasted until 236 CE, reaching its heyday during the reigns of Gautamiputra Satakarni and Vasisthiputra Sri Pulumayi during the second century CE.

The Satavahana kingdom was highly prosperous due to a decentralized administration and diligent investment in agriculture and commerce. Grand-sounding imperial titles were eschewed by the monarchs who divided their kingdom into small provinces, devolving power onto a variety of civil and military officers with the necessary initiative and responsibility in the governance of their territories. Farming was strongly encouraged through land grants issued by the monarchs. Those with knowledge and skills, such as the Buddhist monks and the higher-caste Hindu Brahmans, were provided with special incentives such as the retention of land revenues, as many contemporary epigraphic inscriptions would testify. The export of agricultural goods was much promoted, and for this reason, merchants and traders were supported by the state to develop trade routes from the hinterlands to the ports. Inland trade was given a considerable boost as a result of this; commercial links were made with the Kushans, who controlled most of north India. Large and small urban centers developed and flourished throughout the Deccan; their function as markets was facilitated by networking with rural people in their neighborhoods. Skilled craftsmen were organized in guilds (*srenis*) that monitored the quality of products and provided loans at varying rates between 2 percent and 5 percent, depending on the credit rating of borrowers. Individual merchants and guilds were engaged in long-distance international trade with Greece and Rome, the countries of the Persian Gulf, Southeast Asia, and China. Along both the east and west coasts of India the Satavahanas controlled a number of ports, with the great entrepôt of Dharanikota on the river Krishna being the most important. Roman, Greek, Egyptian, and Persian ships were the carriers of long-distance trade in which the Satavahana merchants had a considerable stake.

Another contributing factor to the prosperity of the Satavahana kingdom was their monarchs' pragmatic decision to respect the rights of all

people, irrespective of their religious beliefs. As Hindus they followed the Brahmanic faith but showed no hesitation in exalting Buddhism. They supported the building of Buddhist cave monasteries across the Deccan. These sites, also serving as semicommercial outposts, attracted a huge number of pilgrims and travelers, among whom the richer ones bequeathed some of their wealth for the upkeep of the monastic institutions. The epigraphic inscriptions give scholars various details of the religious philanthropy of Andhra merchants. Philanthropy also sustained artistic creativity. There was a profusion of Buddhist and Hindu sculpture, and some of the best examples of this art have been recovered from the great stupa of Amaravati, near Dharanikota.

AMARAVATI SCULPTURES

Amaravati, situated in the valley of the River Krishna, had attracted Buddhist settlements from as early as the time of the Mauryan emperor Aśoka, and under the later Satavahanas and their successors, the Ikshvakus, a great stupa (Buddhist mound structure) was built. A marble railing surrounded it, and marble slabs covered the dome. The stupa has been destroyed, but the extraordinary pieces of sculpture, recovered from its ruins, were listed and recorded in 1816 by Colonel Colin Mackenzie, later surveyor general of India. He also made numerous drawings that are preserved at the India Office of the British Library. It was in 1880 that a total of 133 exhibits were permanently deposited at the British Museum. These exhibits visually educate us into the life of the Buddha and the Buddhist social order in India. Some exhibits are also to be found in the Madras (now Chennai) Museum, where sculptured panels depict scenes such as the disposal of Buddha's relics, the subduing of a mad elephant, or the veneration of the Buddha's begging bowl. The Musée Guimet in Paris possesses a beautiful head of the Buddha in the style reminiscent of the Kushan Mathura Art School style. Altogether, the Amaravati sculptures had a great influence on later Indian art, particularly on the carvings of the southern dynasties.

■ Introduction: The Rise and Fall of Chinese Dynasties

Traditional Chinese historical accounts describe Chinese political history as a sequence of rises and falls of various dynasties, and with these rises and falls China alternates between being very centralized and being very decentralized. This traditional conception well matches the political reality of China from 1000 BCE to 300 CE, a period in which China saw some of its greatest philosophical achievements and some of its most brutal warfare.

In 1027 BCE the Shang dynasty of China was conquered, and the Western Zhou dynasty came to power. Conquering much of China, the Zhou

did not directly rule the country but instead instituted a series of territorial leaders who were allowed to govern as they saw fit. In 771 BCE the Zhou moved their capital to the east (beginning the Eastern Zhou dynasty) in the wake of military threats from the west and an erosion of power caused by their hands-off approach to governance.

Although the Eastern Zhou dynasty survived until 256 BCE, China under the Eastern Zhou was not a unified country but in practical terms had become vastly decentralized. The first half of this period is also called the Spring and

Autumn period (722–481 BCE), the time when Confucius taught. The second half of the Eastern Zhou is also known as the Warring States period (403–221 BCE), a period in which the decentralized polities of China were in open warfare with one another and the Zhou dynasty collapsed.

The Warring States period extends past the end of the Eastern Zhou period, as various polities battled for authority. In 221 BCE the conflicts came to an end when the Qin dynasty gained control. The Qin did not last long. By 206 BCE the authority of the Qin had waned, and Chinese politics had devolved into warfare again. In 154 BCE the Han dynasty had conquered most of China, which other than a brief loss of control to the Wang family (from 9 CE to 23 CE) led China until 220 CE. From 220 CE until 280 CE, three independent kingdoms that warred with one another ruled China. In 280 CE China was unified once again under Jin, a unification that lasted until 316.

—Kevin M. McGeough

Western Zhou and Spring and Autumn Government

The Western Zhou and Spring and Autumn periods began as a time of stability, but the power of the Zhou kings declined, and vassal states struggled for power. Government structures became more complex to better mobilize resources for the state. By the end of the Spring and Autumn

period, the Zhou king was a figurehead with no power. The former vassals continued fighting among each other in the Warring States period.

The Western Zhou period (1045–771 BCE) was considered the standard of perfect government for much of Chinese history. The Zhou dynasty began when King Wu led the conquest of the Shang dynasty. The Zhou managed their new territory by parceling it out to the king's relatives. They established essentially independent states. They ruled under the authority of the Zhou king, shown by their lower titles such as duke or marquis. The king could make some appointments and command them to go on military expeditions, but outside of that each noble ruled his own state with little interference in daily administration.

Traditional histories and inscriptions on bronze vessels suggest that this system worked well initially. However, as time went on family ties between the ruling families broke down and were no longer sufficient to hold the states together under the king's rule. Struggles between the states for power became more frequent, as did rebellion against the Zhou king's authority. Royal power further declined in 771 when the capital was sacked and the king was killed. His successor established a new capital to the east, inaugurating the Eastern Zhou.

The first part of the Eastern Zhou, the Spring and Autumn period (770–481 BCE), takes its name from the *Spring and Autumn Annals*, the court chronicle of the state of Lu. This chronicle is very terse, and the best source for information is the *Zuo zhuan*, a narrative history of the time. The period was marked by increased competition among the many states for supremacy. There were about 150 states at the beginning of the Spring and Autumn period. This number shrank as smaller states were swallowed by more powerful neighbors. Most states consisted of a fortified capital city surrounded by countryside where the government had little authority. The challenge for governments was to mobilize the resources in the countryside to strengthen the state.

One way they did this was through the county system. States divided outlying areas into counties headed by a governor, who collected taxes on behalf of the ruler. Another practice was establishing smaller fiefs within the state. A

THE PROTECTOR SYSTEM

As the power of the Zhou king declined in the Spring and Autumn period, the protector institution arose. The protector (*ba*) was the ruler of one of the more powerful states. He had the authority to summon the rulers of other states for conferences and could carry out military campaigns on behalf of the king. The protector was supposed to enforce the king's authority and maintain political stability. Duke Huan of Qi was the first protector, appointed by the king in 671 BCE. The system died out later, as no ruler was strong enough to take the title.

—David Elstein

worthy minister might be granted a certain area within the state. The government could thus indirectly administer areas that it could not control directly. The problem was that this gave potential rivals a way to increase their own power and challenge the ruler. This in fact happened. Toward the end of the Spring and Autumn period, several families of ministers usurped power and took over the state.

Empire and Elites in Zhou and Spring and Autumn China

The Zhou royal family completed their conquest of the Shang at an uncertain date, sometime around 1050 BCE. The Zhou royal family encouraged its members to expand the Zhou influence to other areas as widely as they could. It not only enfeoffed (meaning incorporated into a vassal relationship) important members of the Ji and Ji-ang families as vassal states in strategic locations, such as the states of Lu, Qi, Wei, Jin, and Yan, but also led the joint army, made up of troops from different vassals, to put down the invasion of nomadic nations and any insurgencies that might arise.

At the beginning of the dynasty, the Zhou kings mainly concentrated on conquering the eastern nations. Afterward, the Zhou kings launched wars against the northern, western, and southern nations. These wars expanded the Zhou influence throughout the areas they reached; however, they nevertheless impaired the Zhou royal power, especially when the kings' armies were defeated by rebellious vassals or nomadic nations. For example, King Zhao was killed during the campaign against the Chu state in the south. When King Xuan, the penultimate Western Zhou king, lost the armies in battles against the Chu state, the dynasty became

extremely vulnerable and was finally deposed by the combined force of the states Shen, Zeng, and a nomadic state, Quanrong. During the Spring and Autumn period, the situation of the Zhou royal power grew more tenuous, while some of the local vassals became increasingly powerful and independent. They began to ignore the authority of the Zhou royal family and became involved in a competition for dominance. The first vassal who achieved the position of hegemon was Duke Huan of the Qi who, assisted by the famous reformist Guan Zhong, subdued those who did not accept the Zhou authority with the slogan "respect the Zhou king and fight against the nomadic nations." Qi lost its hegemony after the Duke Huan died and the State of Jin came to the stage. The turning point for Jin to achieve its hegemony was its defeat of the Chu in the time of Duke Wen of the Jin. His successor was able to continue Jin's hegemony. The State of Chu became strong during the time of Duke Mu of the Chu, while from then on the Jin began to go downhill. Finally, in the time of Duke Zhuang of the Chu, the Chu took revenge by winning a battle against the Jin at a place named Bi and began to take the position of hegemony. However, the Jin returned to its hegemony during the time of Duke Jing of the Jin. From then on, there was a seesaw between the Jin and Chu, and a number of smaller polities were also involved in this seesaw.

When Jin and Chu became exhausted in their competition for hegemony in the central Plain area, two other strong states, Wu and Yue, began to play their roles in the southeast. Both of them were able to achieve hegemony by defeating their northern adversaries. The division of the Jin into Han, Zhao, and Wei states in 453 BCE marked the end of the Spring and Autumn period and the beginning of the Warring States period.

Warring States Administration

Administration in the Warring States period (481–221 BCE) established the model for government in imperial China. Power was concentrated in the hands of the ruler. Government offices became more bureaucratic, filled by appointment rather than inheritance. The ruler could hire and dismiss at will, and institutions evolved to establish government control over larger populations. This increased the military and economic power of the states.

States in the Early Spring and Autumn period were city-states. Many offices were inherited, and a powerful aristocracy limited the ruler's authority. By the middle of the Warring States period, there were just seven important states, each with multiple cities and controlled by strong rulers. These leaders took the right to appoint their own officials, often from outside the state. Many of these were educated commoners rather than aristocrats. They were paid a salary in grain instead of being given land of their own. Fiefs in this time provided income from an area without the power of administration and were usually not hereditary. These changes concentrated power in the hands of the ruler.

The Grand Scribe's Records is a major source for the history of this time. This work describes the decline of the Zhou king and the struggle to unify the warring states. All of the rulers of the seven states took the title of king. This had previously been reserved for the Zhou ruler. In this way, they signaled that they no longer

recognized the authority of the Zhou. The states were now independent in name as well as in reality.

The county system of the Spring and Autumn period was expanded. Many of the states at this time divided their entire territory into counties. Another innovation was requiring all adult males to register with local officials. Officials used these registers for tax collection and military recruitment. The kings could collect more taxes and raise larger armies than before, making the state stronger. Sometimes several counties were grouped into a larger administrative unit called a commandery. Rulers appointed governors for the counties and commanderies. The governors could be reassigned or dismissed by the ruler, so it was more difficult for them to build a power base. The state of Qin was most effective in administrative reform and eventually conquered the other states to form a unified empire.

Governance in the Qin Dynasty

In 221 BCE, King Ying Zheng of Qin unified the seven major kingdoms in China. Ying Zheng replaced the title “king” (*wang*) with a new term, “emperor” (*huangdi*). This change had a symbolic importance, because Ying Zheng wanted to emphasize the superiority of the Qin dynasty. The capital city of the Qin dynasty was Xianyang, near modern Xi'an. The new Qin governing system had a centralized administration. This administration had a tripartite structure that consisted of the *sangong* (“three excellencies”), the three officials who stood at the highest level of the civil service and imperial administration. Sometimes the excellencies were two officials rather than three. The *sangong* were the chancellor (*chengxiang*), the great military commander

➤ LORD SHANG

Shang Yang is credited with most of the reforms that made the state of Qin a major Warring States power. He was a native of Wei who traveled to Qin looking for advancement. He became a minister of Qin in the mid-fourth century BCE. The *Book of Lord Shang* attributes several policies to him, but much of it was probably written after he died. Shang Yang developed a strict penal code, expanded military service, and instituted a system of ranks to reward service to the state.

—David Elstein

(*taiwei*), and the great inspector (*yushi dafu*). The chancellors, who were second only to the emperor and were responsible for assisting him, were two officials at times: the “right” and the “left” chancellor.

Under the Qin dynasty, the empire was divided into 36 commanderies, each of them subdivided into counties. Like the central government, each commandery had an administrative triumvirate: a governor, a commander, and an imperial inspector. Magistrates administered the counties. These posts were not hereditary and had fixed salaries. This system of centralized jurisdiction became the norm for later dynasties.

In addition to changes in political structures, other important institutions were standardized: the law code, written characters, weights and measures, metal currency, and the gauge (wheel spacing) of chariot wheels. All of these reforms helped unify China in different ways. The standardization of written characters was pivotal to the cultural unification of the empire. Before the Qin empire, characters varied across regions. The orthographic simplification was fundamental for political unity, and further

reforms were carried out by the subsequent Han dynasty. Weights, measures, and metal currency were standardized to encourage economic development and simplify transactions. The gauge of chariot wheels was standardized to allow easy transportation within the empire’s territories.

The Qin also sponsored infrastructural improvements in an effort to expand their influence. In 220 BCE a series of imperial roads was constructed, originating from the capital city, Xianyang, and proceeding north, northeast, east, and southeast. By 212 BCE a major north-south highway was built, known as the “straight road,” starting from north of Xianyang and proceeding northward for a distance of around 497 miles (800 kilometers). By 221 BCE construction on the Great Wall had begun.

During the Qin dynasty, the ideas of Shang Yang (ca. 385–338 BCE), together with those of Shen Buhai (d. 337 BCE), shaped the framework for guiding political decisions. Li Si (d. 208 BCE), an early chancellor under the Qin, brought a strong legalist policy to Qin government policies.

In 210 BCE the first emperor suddenly died from unknown causes. His heir was supposed to

ANCIENT ACCOUNTS OF THE COLLAPSE OF THE QIN DYNASTY

According to Han dynasty (206 BCE–220 CE) sources, the reasons for the downfall of the Qin dynasty were mainly moral ones. The first emperor was self-satisfied and did not seek advice. The second emperor did not correct this fallacious behavior but instead followed it. When Zi Ying became king, he stood alone and had no good assistants with him. Other ancient stories explain the collapse as the result of a misunderstanding. In 215 BCE Emperor Qin Shi Huangdi returned from a fruitless voyage in search of an elixir of immortality, a quest that the first emperor of Qin was said to have become obsessed with. Back at the capital, Master Lu presented an oracular text that stated: “That which will destroy Qin is Hu.” The emperor thought that “Hu” referred to the Inner Asian barbarians and sent his general, Meng Tian, to attack these barbarians. However, “Hu” was also the first word of the personal name of Hu Hai, the emperor’s younger son, who eventually took over the throne.

—Elisa Sabattini

be the emperor’s eldest son, Fu Su, who at the time was in the northern frontier along with the general Meng Tian. Zhao Gao, who had been a tutor of another of the emperor’s sons, Hu Hai, in legal matters persuaded Li Si to place Hu Hai on the throne instead of Fu Su. Subsequently, Fu Su and Meng Tian were forced to commit suicide as Hu Hai mounted the throne as the second emperor, Er Shi Huangdi.

By 208 BCE, all power was in the hands of the advisor Zhao Gao, who convinced the second emperor to arrest, mutilate, and finally kill the chancellor, Li Si. After this, Zhao Gao took the role of chancellor. The second emperor reigned for three years, until 207 BCE. By then the authority of the Qin dynasty was already very weak, and a few years later the second emperor was also killed. Zi Ying, a grandson of Shi Huangdi, took the throne and assumed the title of “king” instead of “emperor.” Zi Ying killed Zhao Gao, but the country was already in a state of disorder due to rebellions. A few days after Zi Ying’s accession,

the Han leader Liu Bang occupied the capital city, and the state of Qin came to an end.

Bureaucracy in the Qin and Han Dynasties

Qin (221–206 BCE) bureaucratic rule is known as the *junxian* system. In brief, junxian was a system of rule whereby the dynastic court dispatched a limited number of provincial administrators to administer the realm on their behalf. Its name derives from the basic organization of territory along the lines of 36 commandaries (*jun*) and counties (*xian*), counties being subunits within commandaries. Qin officials (*li*) were appointed for a number of reasons. Some of the reasons include former military achievement, success at passing an exam, and demonstrated knowledge of legal or administrative procedures. Offices in the Qin dynasty were also sometimes passed down from father to son. Qin officials were ranked, and their salaries, given in bushels of grain, were commensurate with the scope of their responsibilities as well as their experience. Finally, officials were evaluated annually, and these evaluations were forwarded to the capital and used to determine whether or not to promote or demote the individual in question.

The Han (206 BCE–220 CE) bureaucracy was established along the basic principles of the Qin system. At its height, the Han bureaucracy encompassed a total of 130,000 men, of which 4,000 received their commission or appointment in the capital. The rest were appointed locally. By the end of the Eastern Han dynasty (25–220 CE), there were slightly over 100 commandery-sized administrative units. The commandery would have been headed by a centrally appointed offi-

cial, the governor (*taishou*), who was responsible for all civilian and military affairs as well as for administering criminal and civil law. Below the level of the commandery was the county, numbering over 1,000, each of which was headed by another centrally appointed official, known as the magistrate (*zhang* or *ling*). Both the governor and the magistrate maintained staffs. The Han court devised various measures to strictly limit the authority and power of governors and magistrates. For monitoring and evaluating governors, there were 13 censors (*cishi*), each with a staff of 9 men. The responsibility of monitoring magistrates fell to governors and an assistant, the inspector (*duyou*).

In theory, governors and magistrates could have come from virtually any background. While the possibility of being an administrator was theoretically open to all, economic realities militated against broad participation of men who were not independently wealthy. This is because Han society exhibited a high degree of social stratification: up to three-quarters of all land under cultivation was owned by large landholders, and more than half of the population consisted of landless tenant farmers. Officials came into the Han bureaucracy through a variety of tracks. One less common track involved being brought into the bureaucracy through nomination (*chaju*). Nominated by the governor in his home commandery, a man would be catapulted into the commissioned ranks. A more common track was for a commissioned officer to begin his career as a local appointee either at the county or commandery level and move gradually into the commissioned ranks.

QIN AND HAN COMMUNICATION—WOOD AND BAMBOO SLIPS

In Qin and Han times, official communications were written on bamboo and wood slips. The photograph below shows wood slips from the Juyan site (ca. 100 BCE–100 CE). The strips featured below contain information about ratios allotted to local and military officers. Documents like those found at Juyan suggest that the Han government had developed a sophisticated and extensive communication system.

Politics and Governance of the Western Han Dynasty

The Han dynasty had the good fortune to follow a very efficient but brutal dynasty. They were able to retain their predecessors' efficiencies while denouncing their harsh rule. The Han presided, with one brief interruption, from about 202 BCE until 220 CE. The first period, about 202 BCE to 9 CE, is generally known as the Western (or Former) Han dynasty. The unpopular Qin dynasty began dissolving under pressure from rebels in 209, followed by a series of court murders starting in 208 BCE. Liu Bang, a Qin functionary from the Chu region, occupied the Qin capital in 207 BCE. The next year, Liu's former commander, Prince Xiang Yu, sought to subdue Liu by sacking the city and burning the palaces. Xiang's goal was to reestablish the confederacy of small, roughly independent kingdoms that had existed before the Qin, while Liu was intent on continued centralization. Liu assumed the title "King of Han" in 206, but many historians believe it more accurate to date the Han dynasty's beginning to 202, the year that Liu defeated Xiang and established control over the area previously claimed by the Qin. Liu is commonly known by his temple (or posthumous) name, the Gaozu emperor.

The Han gained popular support by publicly condemning the ferociously punitive characteristics of the Qin legalism while preserving much of the previous dynasty's administrative organization, a pyramid structure with statesmen

charged with overseeing the administrative apparatus. As with the Qin, the Han emperors personally retained ultimate power, including the prerogative of directly appointing regional governors and princes over the patchwork of administrative territories as they worked to institute a more orderly centralization. Centralization reached its apex under the reign of a brilliant successor, Han Wudi (r. 141–87 BCE).

Han Wudi was the first to clearly articulate the ideological basis of the dynasty, promoting Confucianism although expanding its precepts to include anything useful to bureaucratic management while maintaining a very legalistic reliance on penal codes to enforce the government's will. Cooperative weather patterns and good management combined to produce a generally affluent era. In times of local distress, such as flooding or crop failures, Han Wudi, like others of the dynasty, was able to provide support from imperial stores. With a broad base of support, Han Wudi was able to field huge armies to face incursions of the Xiongnu and to establish military colonies to protect the frontier lands without destroying the prosperity of the country.

Despite Han popularity, there was always a strong tension between powerful local forces and the central government. The Han tried to keep landlordism at a minimum in order to preserve a solid base of small cultivators, maximizing tax revenues by eliminating the expenses of rent and crop sharing. The Han collected land taxes as well as poll (or head) taxes. It was relatively simple to keep track of land, although at times fraud in ownership or production records had an impact on returns. Poll taxes were more difficult to collect; population mobility and a failure to record all male births diminished the available base. These problems in assessing and collecting taxes have been characteristic of Chinese bureaucracies from the Qin conquest until the modern era.

—Carolyn Neel

► INTERRUPTION OF HAN RULE

The brief interruption of Han rule occurred in 9 CE, when Wang Mang, the regent for a child emperor, named himself emperor of a short-lived Xin dynasty. He instituted controversial economic policies—such as nationalizing ownership of land and indentured labor—causing great turmoil even before the Yellow River's change in course convinced peasants that Wang had lost the Mandate of Heaven. He was killed by rebels in 23 CE. Before the end of the Western Han, the Chinese government had taken the form that was to dominate its political system until the twentieth century.

CHINA DURING THE HAN DYNASTY, 100 BCE

Politics and Governance of the Eastern Han Dynasty

The Eastern Han dynasty (also called the Later Han) arose out of the ashes of the Western Han and the self-proclaimed Xin dynasty in 25 CE, lasting officially until 220 with the advent of the Three Kingdoms period of Chinese history (220–280). Although having a set of ministers focused on governance to help the emperor rule, the dynasty was plagued with conflicts for political control of the capital, increased power of landlord families and their private armies, and provincial governors becoming lords unto themselves.

The control of the empire theoretically rested in the hands of the emperor, with a large retinue of bureaucrats to help him in his ruling tasks. These included the three excellencies (of finance, state, and works) and nine ministers (of ceremonies, palace, guards, transportation, justice, state visits, imperial clan, agriculture, and

household treasurer). But after the first three emperors of the Later Han, only minors were placed on the throne, leaving members of court to fight over the control of the child through consorts. To ensure success, courtiers relied on court eunuchs to help win these struggles, whereby victory meant placing one of their relatives as the imperial bride to become chief adviser to the emperor. This made the eunuchs powerful quickly.

In one outrageous act, a group of eunuchs managed to crush and kill all the members of a particular consort clan as well as 100 Confucian scholars protesting eunuch power. Soon it was different eunuch groups who were in charge of picking the youthful emperor to gain control over him, but without military strength, the central government lacked power. It had ended conscription, worried that teaching peasants how to fight would lead to better-prepared peasants during any possible future rebellions.

➤ NOMADIC NEIGHBORS AND NORTH CHINA

The Eastern Han had succeeded in defending the northern and northwestern frontiers from the Xiongnu (the Huns) by using “barbarians to fight barbarians” (nomad against nomad). These allies—the Qiang and the Wuhuan during this period—had settled within China’s frontiers, following their own customs and leaders with only minimal supervision by a Chinese official. Their job was to defend against the Xiongnu or the Xianbei, who had started a new confederacy of northern nomads after the Xiongnu had weakened. With the start of the civil wars of the Eastern Han, these nomadic groups would increase the lands under their control and serve as cavalry for hire to those seeking to retake control of China. Despite a brief period of unification following the Three Kingdoms period, China lost its northern half to a series of nomadic invasions that lasted for the next three centuries.

—William Ashbaugh

The hand of the Chinese state did not reach down to appoint administrators at or below the county level, leaving police, judicial, and taxation powers in the hands of the richest local families in return for tax-free status. These families often overstepped their authority, cheating the central government out of revenues either through outright graft or by buying land cheaply from peasants with the understanding that the subsequent rental rates would remain much lower than the earlier taxes collected. These families, due to disruptions at the end of the Western Han dynasty (206 BCE to 9 CE) and the Xin period (9–25 CE), kept control of their private armies for protection from bandits, peasant rebels, and, in northern China, potential nomadic invasion. Even provincial governors, chosen by the imperial bureaucracy for their capabilities and loyalty, changed their roles after the first 100 years of the dynasty. No longer simply inspector generals, these governors began amassing power through private armies to become real generals. Depending upon the province’s distance from the capital in Luoyang, the governor might rule as a lord unto himself and use his military not solely to put down rebel-

lions but also to increase or keep power. That was particularly true of those based on the northern frontier among the allied nomadic tribes. And sometimes local leaders and governors were led by the same great families.

Peasant uprisings began in 126 due to increased tax burdens and concentrated landownership. The private armies easily defeated these first rebellions and incidentally provided more power to the provinces and away from the central government. With the rise of the Daoist peasant rebels, the Yellow Turbans, 58 years later, control of the emperor and capital became unimportant. The private armies defeated the peasant armies and then proceeded to fight each other for control of China in a massive civil war. In 220 CE the Han dynasty officially ceased to exist, and China was divided into three equally powerful states for the next two generations, the famous Three Kingdoms period.

Governance in the Period of the Three Kingdoms

The Three Kingdoms period (220–280 CE) in Chinese history has been widely romanticized through novels, television programs, movies, and even video games due to the Machiavellian nature of the struggle for domination of Wei, Wu, and Shu. The Three Kingdoms also heralds the start of the Period of Disunity, an era stretch-

ing from the fall of the Eastern Han dynasty in 220 until the rise of the Sui dynasty and its conquest of the south in 589. During the Period of Disunity, China, except during 280–316 (the Western Jin dynasty), broke up into two or more competing states, with the northern half of the country usually under control of one nomadic conqueror after another and then fought over by Chinese generals. Yet even while the three states fought one another to try to re-create a single Chinese empire, leaders within Wei, Wu, and Shu worried about the ties to the great families and their private militias that had led to the fall of the Han empire.

Although the official date for the fall of the Eastern Han dynasty is 220, a civil war for control of the empire that led to the split and formation of the Three Kingdoms came about starting in 184. A peasant uprising led by a secretive Daoist sect threatened the empire. Powerful families already controlled powerful militias for a few generations, and the forces at their disposal in the late second century had grown greatly along with their lands. These families, provincial governors, and frontier seminomadic tribes all sent their private armies to fight the peasant threat. It became apparent that the central government—unarmed on purpose for fear that its trained soldiers would help any peasant rebellion—did not matter in the struggle. Soon these powerful armies fought one another for control of the empire, and when no single leader could achieve victory, China was split into the states of Wei, Wu, and Shu, officially in 220.

All three leading families in the states—Cao (replaced by Sima) in Wei, Sun in Wu, and Liu in Shu—considered themselves the true heirs to the Han dynasty but worried that their strength was so tied up with the wealthy families and their private armies that they too might fall into constant civil war. Something needed to be done to bring these families in the provinces unsupervised into the capital and a close relationship with the state. Wei was the first to work on promoting able and trustworthy bureaucrats from these powerful families. Wei and then the other states no longer sought virtuous Confucian gentlemen to run the government. Using a system called Nine Ranks, impartial judges ranked official aspirants for jobs on the basis of talent and

➤ WISE BUREAUCRAT OF THE THREE KINGDOMS PERIOD

Chancellor Zhuge Liang of Shu is famous throughout the Chinese-speaking world for his wisdom and military genius. The hugely popular Ming-era novel *Romance of the Three Kingdoms*—written 1,200 years after the events—even has Zhuge causing the wind to blow to send fire ships at his enemy. The novel also records a more truthful tale. In order to secure Shu's border during offensive operations in the north, Zhuge was called upon to attack the non-Chinese "barbarians" to the south led by Meng Huo (the novel changes the situation somewhat to make Zhuge even more of a hero, while Meng Huo is a rebel leader, very much Chinese). Zhuge proceeded to defeat and capture Meng Huo seven times, each time releasing him until Meng finally agreed not only to stop his fight against Shu but instead to work with Zhuge to attack Wei in the north. Zhuge's magnanimity achieved more than execution or imprisonment.

—William Ashbaugh

character. High-ranking officials, believing that they were themselves highly talented, thought that they could detect talent and other traits through examining the face and voice of the job seeker. They also believed that these traits, especially loyalty and ability, passed on from father to son, so the government bureaucracy would henceforth be hereditary. Although clearly talent, ability, and loyalty cannot be estimated based on facial or vocal characteristics, the fact that a new nobility arose with this hereditary system made the king more secure—his relatives joined him in the government—and allowed most great families into the halls of power. People incapable of leadership either lost their important positions or never received appointment to them, instead finding themselves shunted off into a post with few responsibilities. Officials employed during the Three Kingdoms gained entrance into the bureaucracy by birth but did not have a guarantee for a powerful place within the government, leading to a stable system.

Chinese Unification under Jin

The Three Kingdoms period came to an end in 280 CE when the state of Wei under the Jin emperor finally defeated the state of Wu for control over China as a whole. This victory was possible because Wei had access to nomadic allies, with

► REBELLION OF THE EIGHT PRINCES ENDS JIN'S UNIFICATION OF CHINA

Sima Yan of Wei won the wars of the Three Kingdoms to become the emperor of the Jin dynasty, unifying all of China in 280 CE. The new emperor passed out lands to his 15 sons. Two years after he died, most of his sons tried to take power for themselves in the Rebellion of the Eight Princes (291–307). Fighting only ended when all the major princes but one were dead. During the rebellion, all sides turned to nomads and seminomads to help win their battles, with cavalry where geography allowed it. It did not take long before the nomads realized the weakness of the Chinese empire. The Xiongnu (Huns) sacked first the eastern capital and then the western capital. Their leader, understanding the ways of the Chinese, declared himself the new emperor of the northern China plain. The Jin dynasty fled south, leaving China split for more than three centuries.

—William Ashbaugh

their useful cavalry, and because the population of Wei was more than double that of the Wu. Emperor Sima Yan placed his relatives in positions of power and his sons into control over much of the newly conquered countryside. When he died, the sons rose up in the Eight Princes' Rebellion, using nomadic allies to try to take control of China. The end result was the realization by the nomads that the Chinese were weak and the split of China into two or more states until the Sui dynasty and reunification in 589.

The state of Wei fought well under the Cao family from even before the official end of the Han dynasty. But their southwestern enemies, the Shu, had as chancellor one of China's greatest military leaders, Zhuge Liang. Even though Wei outnumbered Shu by three to one, the presence of this genius and the fact that Wu also challenged Wei for supremacy allowed the smaller states to continue the struggle and avoid early surrender. Once Zhuge died in 234, Shu leaders began to rely on court eunuchs to administer their state. This proved a huge error; eunuch corruption made military matters difficult. A massive invasion by Wei in 263, partly through seemingly impassible terrain, meant the defeat of Shu and its southwestern territory added to that of Wei.

Within Wei itself threats of violent change convinced Cao Huan, the king of Wei, to abdicate in 265 CE. Sima Yan took control of Wei and declared himself the first emperor of the Jin dynasty, even though Wei controlled only two-thirds of China. Some scholars take this date to be the end of the Three Kingdoms period (as only two states remained, with one of them the eventual victor and unifier of China), but that system of dating would mark the Jin dynasty start before it completed the conquest of China.

For the next 13 years, only sporadic fighting occurred. In 279 Wei finally launched its all-out assault on Wu, including a fleet full of soldiers trained as marines sailing down the Yangzi River. With its best general dead seven years earlier and its capital sacked in early 280, the leader of Wu surrendered in exchange for a fiefdom to call his own. The Jin dynasty militarily reunified China.

In order to run the bureaucracy of first the Wei and then the Jin dynasty, first the Cao family

and then the Sima family relied on finding talented bureaucrats through the belief that high officials could spot loyal and worthy job seekers through facial features and speaking abilities. And talent was passed from father to son. This hereditary bureaucracy was full of supposed talent rather than Confucian virtue (part of the Han dynasty officialdom), although the more important jobs in the bureaucracy belonged to those who had proven themselves through excellent efforts. Those related to the Sima family were also rewarded with governmental positions. The emperor gave his 15 sons control over vast areas of his empire, thinking that this would keep them loyal to him and avoid the troubles that plagued Wei with the competition between brothers. This strategy worked, at least during Sima Yan's lifetime. Upon his death, his sons' internecine war forced the Jin to retreat south-

ward and give up northern China to a series of nomadic invaders until the Sui unified China once more.

■ Introduction: Agriculture, Trade, and Social Stratification in Asia

From 1000 BCE to 300 CE, the spread of agriculture throughout Asia and the growth of trade, spurred much in part by the influence of China, facilitated the development of more complex forms of governance and more highly stratified societies. The situation is most clearly understood in Korea, which first developed agriculture around 1300 BCE; from that point on, the gulf between the wealthy and poor grew substantially. By the first century of the Common Era, powerful chiefdoms had emerged in Korea that competed with one another for political authority. Thus, the period of the Three Kingdoms (ca. 1–300 CE) was a time of intensive competition and shifting political alliances.

The situation is less straightforward in Japan, as scholars have only the archaeological record to rely on. From 300 BCE on as Japan became a more agricultural society with closer ties to China and Japan, evidence for wealth and status differentiation becomes more apparent. Most exemplary of this are the differentiated

graves (burials that display differing levels of wealth) associated with what archaeologists call the Yayoi culture.

In central Asia it is not agriculture that spurs on the developing social and political complexity but rather trade. Monarchies centered upon city-states emerge in towns centered on oases. Although the societies are not agriculturally based, the new divisions in society emerged when the societies settled in permanent locations.

—Kevin M. McGeough

Early Korean History through the Three Kingdoms

The Koreans, who are descended from Tungusic tribal peoples, are one of the world's most ethnically homogeneous peoples. The Korean Peninsula has been inhabited since Paleolithic times, and Korean historians have traced the ethnic roots of the Korean people as far back

THE HORSE RIDER THEORY AND THE FOUNDING OF THE YAMATO DYNASTY

Japanese historian Egami Namio in 1948 proposed a theory, popularly known as the Horse Rider theory, that Japan was conquered around 300 CE by a large invasion of horse-riding nomads from Korea who then founded the Yamato dynasty, which still rules Japan to this day. According to one version of this theory, the horse rider conquerors were from the northern state of Puyo and were driven southward by constant turmoil in northern China and Manchuria. They then are said to have crossed the Korea Strait to Japan.

The Kofun period of early Japanese history, which takes its name from huge keyhole-shaped tomb mounds that began to appear around 300 CE, is closely tied to the Horse Rider theory. Hundreds, if not thousands, of these tombs are scattered across central Japan. It is hard to know the exact number of these mounds because they are often indistinguishable from large hills except from the air, where their distinctive keyhole shape can be discerned. Only a few of these tombs have been excavated because they are considered to be sacred, but those that have been investigated have produced hollow pottery statues as well as stirrups and bridles. These are the first evidence of horses in Japanese history.

It is also known that a new ruling elite emerged in Japan around 300 CE that seems to have

commanded the obedience of the people and to have had a surplus of resources to build such massive tombs. It appears that they also used horses as important symbols of their power. Little is known of the Kofun period until the sixth century CE, when writing became widespread.

The Horse Rider theory differs from the quasi-mythological history *Nihon Shoki*, written in 720 CE, that details the rise of the Japanese Soga clan to control of court affairs in the 550s, Prince Naka's overthrow of the Sogas in the Taika coup of 645, and the rise of Emperor Temmu in the Jinshin War of 672. In 710 Temmu's daughter-in-law and niece Empress Gemmei moved the capital to Nara, starting the Nara period of Japanese history.

Although several other scholars have embraced the Horse Rider theory, many others have not. A lack of written records for this period makes the theory nearly impossible to prove or disprove.

as pottery-using cultures dating back to 6000 BCE. Around 700 BCE the use of bronze began in Korea. Agricultural settlements date back to 4000 BCE. Early peoples in Korea lived in small self-sufficient communities, originally hunting bands and later farming or fishing settlements. It was only in the late first millennium BCE that larger political units were formed. Korea's progress was strongly influenced by developments in northern China, where several kingdoms appeared as early as the middle of the second millennium BCE.

The first Korean state to emerge is Gojoseon (Old Joseon). Although later Korean historians would assert that the legendary figure Tangun founded their first state in 2333 BCE, Gojoseon probably got its start between 194 and 180 BCE. Chinese Han emperor Wudi (141–87 BCE), seek-

ing to consolidate the frontier regions of his empire, launched a successful invasion of Gojoseon. Chinese forces subsequently conquered (ca. 100 BCE) the eastern half of the peninsula. Lolang, near modern Pyongyang, was the chief center of Chinese rule. Chinese rule proved to be very important for Koreans because it brought Koreans into contact with China's sophisticated civilization. It is clear that many Chinese immigrated to Korea and that this region had become an integral part of Han dynasty China. The result was a major sinification and modernization of Korean society including the introduction of Chinese writing, religion, philosophy, industry, architecture, and ideas about government organization. Even independent tribes to the south of Lolang became influenced by the diffusion of Chinese civilization.

Several tribal groups including the Puyo and the Koguryo developed tribal federations to the north of Chinese-occupied Korea. The Koguryo, a Manchurian-based power, were an aggressive and warlike people who began launching attacks against the Chinese as early as 12 BCE. The Koguryo tribal federation grew in power in the north, while the Han empire waned and finally collapsed in 220 CE. Subsequent Chinese states lacked sufficient power to maintain their presence in Korea, and Chinese influence gradually disappeared in the third and fourth centuries CE, leaving a power vacuum soon filled by Koguryo and two emerging rival states, Paekche and Silla. Paekche, located in southwestern Korea, developed as a major power by the fourth century CE.

Located in the southeastern part of the Korean Peninsula farthest away from direct contact with China, Silla was late in receiving influence from the continent, and its civilization initially lagged behind its two rival states. While all this was transpiring, there is evidence that large numbers of Koreans migrated to Japan, where they introduced rice agriculture, bronze and iron working, and other technologies.

Early Oasis Kingdoms of Central Asia

With the flourishing of agriculture around the oases of central Asia, the populations of the established towns grew. Eventually, some emerged as kingdoms in their own right. Although small and often absorbed into larger empires such as the Persian or the Han or dominated by nomadic confederations, the early oasis kingdoms played a significant role in world history.

The origins of the oasis kingdoms can be traced simply to the basic fact of real estate: lo-

THE KUSHAN EMPIRE, 50–250 CE

The Kushans arrived in central Asia as part of another round of nomadic migrations. Beginning their existence as part of the Yuezhi confederation based in what is now Kazakhstan, the Kushans migrated south of the Syr Darya as more powerful tribes moved out of Mongolia due to the expansion of the Xiongnu. By 130 BCE, they dominated much of Sogdia. Initially, the Kushans were just one of four other Yuezhi groups in the region. By 50 CE, Kujula Kadphises (d. 80 CE) defeated the other four groups and established his hegemony over the region. By 100 CE, Kushans dominated the Indus Valley as well.

Under Kaniska (127–147 CE), the empire reached its peak and served as a powerful rival to the Parthians and was influential in northern India. Even Chinese records noted Kaniska's power. It is during this period that the Kushan empire moved its center from the oases near the Amu Darya and through the Khyber Pass into present-day Pakistan. This left a power vacuum in central Asia that the nascent Sassanid empire (205–651) filled in the early 200s as well as new nomadic groups entering from the steppes.

—Timothy May

cation. In arid and semiarid regions, control of a source of water and thus life was important. The fact that merchants and other travelers went from oasis to oasis only increased the city's importance. These manifested mainly in ancient Bactria and Sogdia. Bactria overlapped modern Afghanistan, Uzbekistan, Tajikistan, and Turkmenistan and dominated the Upper Amu Darya River, while Sogdia was just northeast of Bactria and extended into modern Afghanistan, Uzbekistan, Tajikistan, Kirghizstan, and the southernmost part of Kazakhstan. Much of this fell under the sway of the Achaemenid empire of Persia (550–330 BCE).

Yet not all oasis cities and kingdoms could be considered spontaneous. In many instances they were planned. Perhaps the best example of this was Alexander the Great's creation of military colonies along the Amu Darya River and the city of Merv, located in the Margiana oasis area. Like many other oasis towns, the building

of high walls was crucial for defense against nomads. Eventually many of the cities developed a common identity through culture and conquest and could rightfully, albeit often tenuously, be called kingdoms. From the Greek and Macedonian conquest came a Greco-Bactrian state centered in Ai Khanum, another city founded by Alexander the Great in Afghanistan in 328 along the Amu Darya. These blended features of Greek culture such as architectural and art forms with local customs. Settlers identified local gods with their Greek equivalents.

By 148 BCE, much of the region consisted of petty principalities with only a loose identity of a larger polity. Nomadic pressure from north of the Syr Darya and the eastward expansion of the Parthian empire (238 BCE–226 CE) appear to be the culprit. Although there is little evidence of destruction to the oasis cities, political centralization declined as cities located near nomadic confederations or the Parthians could seek new allegiances rather than one powerful city. Indeed, many of the oasis kingdoms thrived in their era of independence with ties to nomads. The nomads provided security for the trade routes as well as markets in return for access to manufactured and agrarian products

that they could not produce. In this environment, city-states such as Yarkand, Khotan, Kashgar, and Turfan thrived in the area of modern Xinjiang. In the regions of Bactria and Sogdia, the cities gradually came under the dominance of the Kushan empire (50–250 CE), nomads who eventually migrated south of the Syr Darya and into these regions and eventually dominated Afghanistan and northern India. The Kushan state became representative of the intermingling and commingling of culture in central Asia as multiple cultures, ethnicities, and religions traveled the trade routes between the oasis cities.

■ Introduction: “Barbarian” Politics in Europe and Asia

For the Romans, the people living beyond the boundaries of their empire were barbarians. The word “barbarian” is onomatopoeic, since it is meant to sound like the random sounds that a Roman would hear when a barbarian spoke. These barbarians were threats to be dealt with through physical force because their curious cultural practices were markedly “un-Roman.” Yet archaeology has revealed that these cultures, though significantly smaller in scale than the Romans, were very diverse with rich aesthetic traditions. Most of these cultures were chiefdoms, that is, societies with between 2,000 and 5,000 members at any given time. Some lived in permanent settlements, and others lived nomadic and seminomadic lives along the steppes

of central Asia. The following entries discuss what archaeologists can reconstruct of the political organizations of these groups.

—Kevin M. McGeough

Steppe Nomads

The dominant way of life on the central Eurasian steppe (grassland), which stretches from Mongolia to Hungary, was pastoral nomadism. Although nomadism varied across the globe, steppe pastoral nomads were dependent on the so-called five snouts (horses, sheep, goats, cows or yaks, and camels), all of which were used not only as a food source but also for their by-products, such

➤ WHO WERE THE NOMADS?

Herodotus, known as the Father of History, wrote about the nomads of his era in his *Histories*. Much of what we know about the Scythians originates from Herodotus, but it is clear that many of his contemporaries knew little about them. In an attempt to explain to his countrymen that not all of the nomads were the same, Herodotus wrote:

“The Androphagi are the most savage of men, and have no notion of either law or justice. They are herdsmen without fixed dwellings; their dress is Scythian. . . . The Melanchlaeni all wear black cloaks—hence their name. In all else they resemble the Scythians.”

One of the problems of studying the steppe nomads is that most of the information about them during the period 1000 BCE–300 CE is beyond archaeological finds; most of the information about them comes from sedentary and often hostile cultures. So who were they?

By and large, most sources in the West (Greek, Roman, Persian) refer to the steppe nomads of this area as Scythians. In the East, the Chinese sources refer to them as Xiong-nu. Were these

different tribal confederations? Perhaps. In short, it is difficult to say because the identity of a tribe and also a tribal confederation—a conglomeration of tribes under a single leader—was rather fluid. The identity came from the upper levels of society and was applied to all groups.

During this period, a wide variety of ethnicities and linguistic groups populated the central Eurasian steppes, including Iranians and early Turkic and Mongolian groups. For instance, it is possible that the Scythians were Iranian but included Turkic and Mongolian elements. Meanwhile, the Xiong-nu were viewed as a proto-Mongolian group. However, it most certainly included non-Mongolian groups as well. Thus, when discussing the steppe nomads, it is important to realize that while the culture was often similar through the steppe, the people living in that culture were not homogenous at all.

as wool, hair, and leather. Contrary to the idea that nomads wandered aimlessly, they made planned migrations so as not to exhaust the pasture. In the summer the nomads migrated to the cooler highlands, and in the winter they migrated to the lowlands and into valleys.

The nomads lived in round shelters known most commonly as *yurts*, constructed from wooden lattice walls and covered by layers of felt. These tents could be easily disassembled and either loaded onto camels or placed on ox-drawn wagons, making them easily transportable.

The nomads were organized into tribal groups with clans and subclans based on kinship, although that kinship was often fictive. For instance, the ancestor may have been a mythical figure. The tribes were led by a chieftain, and at times a number of tribes could form a confederation. Leaders were elected from a body of qualified leaders. The leader had to prove competence not only in warfare but also in taking care of the tribe. If that leader failed

to fulfill his obligations, he risked losing his status. There was some stratification within nomadic society. Thus, potential leaders would only come from the aristocracy.

The steppe nomads subsisted primarily on dairy products supplemented by meat, usually mutton. Milk from all of the animals produced a variety of food forms such as cheese, yogurt, and cheese curds. Throughout history, observers have noted one particular item in the nomads’ diet made from fermented mare’s milk: *kumiss*. During the summer, kumiss was consumed in large quantities due to the abundance of mare’s milk after the foaling season.

Despite the steppe nomads’ dependence on their animals, self-sufficiency was nearly impossible. Thus, the nomads had a symbiotic commercial relationship with their sedentary neighbors, typically states in China, oasis towns in central Asia, and the Russian principalities. From these sedentary agrarian communities, the nomads traded or raided for goods they could

not produce, such as silk, grains, tea, metal tools and weapons, and other luxuries.

Sedentary societies feared the nomads for their military abilities. As virtually all of the men, and many women, learned to ride horses and archery from an early age, they were formidable foes. For the most part, though, the nomads had little interest in actively ruling sedentary populations. Instead, they preferred to extract goods they needed. If they could not gain them through amenable terms, then the nomads could form large tribal confederations and invade.

Celts

Early written sources on Celtic political organization are exclusively Greek and Roman, while Celtic law codes survive only from early medieval Ireland. Never effectively unified beyond the local level, classical Celtic societies constituted loosely associated tribes, each of which was headed by a man known to the Greeks and Romans as king (Latin *rex*; Celtic *rí* or *rix*). In

some places and times this position was strictly hereditary, while in others it was elective, a process that could be contentious, but this ensured that a qualified adult would rule. Even when elective, however, the candidates were drawn from the same ruling family. Kings appear to have ruled in conjunction with noble councils, whose members were probably drawn from among the constituent subtribes or clans. In first-century CE Gaul, kingship gave way in some tribes to rule by a local oligarchic council that Julius Caesar called the Senate.

Tribes were divided into smaller units—extended kin groups or clans—that were headed by chiefs. These men were generally the leading warriors, which placed them in command of the principal social institution, the war band. Communities, known as *tuatha* in Ireland, were formed at this level. The males of the warrior class dominated these communities, and together they formed the councils that made the principal communal decisions. Successful leaders possessed the correct lineage augmented with proper and charismatic behavior that included success in battles and raids, gift giving, hospitality, and conspicuous wasting of precious resources (potlatch). Traveling bards celebrated chiefs' and kings' battles and generosity, an important source of group prestige and power. Successful leadership also depended on one's patronage over a large clientele whose economic, military, social, and political support the chief secured by gifts of land, tools, and weapons. A strong Gallic king might command several thou-

➤ JULIUS CAESAR ON GALLIC PATRONAGE

"In Gaul there are factions not only in all the states, and in all the cantons and their divisions, but almost in each family, and of these factions those are the leaders who are considered according to their judgment to possess the greatest influence, upon whose will and determination the management of all affairs and measures depends. And that seems to have been instituted in ancient times with this view, that no one of the common people should be in want of support against one more powerful; for, none [of those leaders] suffers his party to be

oppressed and defrauded, and if he do otherwise, he has no influence among his party. This same policy exists throughout the whole of Gaul; for all the states are divided into two factions."

The Scythians

The Scythians dominated the Eurasian steppe for much of the ancient period (from roughly 1000 to 200 BCE); however, it is difficult to pinpoint exactly who the Scythians were. They appear to have been Iranian or possibly proto-Turkic and dominated the region from the Carpathian to the Altai mountains. Yet scholars have not concluded that the Scythians were an empire or more than a tribal confederation, with the name “Scythian” being derived from the dominant tribe. Thus, it is probably more accurate to conclude that the Scythians were not a single ethnicity but rather several cultures and ethnicities that shared some common features. These may be listed as being pastoral nomads who used composite bows, had knowledge of iron metallurgy, used the *akinakes* (a short sword of a particular design often used in religious ceremonies), carried artistic motifs of stags and other animals in combat, demonstrated widespread use of bronze cauldrons, created deer stones, and most importantly rode horses before anyone else.

Generally speaking, the lifestyle of pastoral nomads changed relatively little over the centuries. The Scythians migrated between pastures during the winter and summer to prevent overgrazing. At times these migrations could range hundreds of miles. In hilly and mountainous areas, the migration tended to be more vertical. During the summer the Scythians moved their flocks and herds to higher altitudes, while in the winter they tended to be in valleys.

➤ BATHING WITH THE SCYTHIANS— EXCERPT FROM HERODOTUS

Historically, Eurasian pastoral nomads have been averse to bathing. Although it developed into essentially a religious and cultural taboo, the basis arises out of a desire to not pollute the rivers and water sources that they and their animals depended on for their very lives. The Scythians found other methods for cleanliness that were recorded by the Greek historian Herodotus.

“Anyway, the Scythians take cannabis seeds, crawl in under the felt blankets, and throw the seeds on to the glowing stones. The seeds then emit dense smokes and fumes, much more than any vapor-bath in Greece. The Scythians shriek with delight at the fumes. This is their equivalent of a bath, since they never wash their bodies with water. Their women, however, pound cypress, cedar and frankincense wood on a rough piece of stone, and add water until they have a thick paste which they then smear all over their bodies and faces. This not only makes them smell nice, but when they remove the paste the day after they turn out to be all clean and shining.” Herodotus 4.75.

—Timothy May

Like later pastoral nomads, such as Turks and Mongols, the Scythians’ diet tended to be based largely on dairy products and meat. Much to the surprise of their more civilized neighbors, such as Greek colonists in the Black Sea, the Scythians preferred fermented mare’s milk and mutton over grape wine and wheat. From their animals, usually a combination of horses, cows, sheep, goats, and camels, the Scythians could produce most of the basics of life. They dwelled in yurts (round felt-covered tents) that were often placed on wagons and kept erect as they migrated.

Although somewhat patriarchal, the division of labor among the Scythians was much more egalitarian than among their contemporaries in China or ancient Greece. Scythian women did the labor surrounding the household, while men tended to herding the animals and warfare. Nonetheless, as households tended to be separated by

several miles, it was not uncommon for men to perform the duties of the women and vice versa out of simple necessity. Indeed, the fact that Scythian women handled the composite bow with ability may have spawned the legend of the Amazons.

In terms of religion, the Scythians practiced shamanism but also built temples or shrines to gods. The veneration of the sky and earth was common among all Scythian groups. Their shamans served not only as intermediaries between the spirit world and the mundane but also as healers, as most illnesses were thought to be caused by spirits. Some concept of an afterlife also existed, judging from the burial remains of the Scythian elites. Ornate jewelry and gilded

weapons and tools were common along with the burial of slaves and horses intended for use in the afterlife.

■ Introduction: Political Life in the Americas

The political organization of the people of the Americas from 1000 BCE to 300 CE was diverse, and in many cases scholars are divided as to the precise nature of the governing structures. This is most apparent in North America, where some larger polities (such as the Hopewell) display evidence that could be understood as indicative of egalitarian social structures or of emerging elites and political hierarchies. Similar problems exist in attempting to reconstruct the political organization of South America. The Chavín culture (located in the Andes) displays evidence of significant social stratification and thus of hierarchical political organization. The question for scholars, then, is if this is the first stratified society in Peru or if earlier cultures were similarly hierarchical.

In Mesoamerica the situation is more clear. Olmec society demonstrates clear evidence of significant social stratification. Although the exact nature of Olmec governance remains obscure, there is significant evidence (especially the famed colossal heads and altars) to indicate that there was a ruling elite at least at the city level. Evidence for early Maya civilization reflects a similar concentration of leadership within a city-state framework; for the most part

the highest level of Maya governance was at the city-state level. The city-state was the largest type of polity for much of Mesoamerican civilization, and this type of governance reached its largest extent with the massive city-state of Teotihuacan, which eventually developed into the largest pre-Columbian city in the Americas.

—Kevin M. McGeough

Development of Chiefdoms in the Olmec Region and Lower Central America

Most scholars agree that one of the cornerstones of civilization both now and in the past is a system of governance. In the case of the first true civilization of Mexico that emerged within the larger Mesoamerica—the Olmec—they developed a network of extended villages that as time progressed might be called a city-state or state. Because of the increasing complexity of life and organization, the headmen of one of the villages within the network over time became the chief of all of the villages, making him the chieftain. From the available evidence, this pattern seems to have occurred among the Olmec. Accompa-

DEVELOPMENT OF CHIEFDOMS IN THE OLMEC REGION

nying this political change, the position ended up eventually being passed down among the male members of the chieftain's extended family. Hence, the chief's immediate family had the highest social ranking.

Through this ranking system, social stratification existed so that certain families within each village dictated the winners and losers in terms of the possession of positions of authority and, more importantly, control over whatever agricultural surplus might be achieved. This shift to a more hierarchical society was not unique to the Olmec, as it occurred over and over again in other similar societies. Each time society became more stratified a tribal village would elect to find a headman (chief) to oversee the interests of the villagers, which represents a time-tested process in terms of the selection of a headman. However, once a chieftain/chiefdom becomes more permanent, the use of coercion (especially in a passive nature) solidified the existing social stratification. This was what oc-

curred in the Olmec heartland. One of the principal functions of rulers was to lead and defend the village from external threats. The chieftain thus became the primary warrior for the village, urbanite, and countryside adventurer.

In reality the chief was both the symbolic and functional part who enabled people such as the Olmecs as well as others to operate as a political unit. Most often the primary function for the chief, other than being a mighty head warrior, was that of the preserver/keeper of the sacred rituals (ceremonies to the gods and/or the ancestors), which thereby invested him with semidivine authority in the eyes of his people. On a more practical level, chiefs derived their income/wealth from the trade emanating from their domains with others both nearby and in faraway places. This trade included mostly rare or exotic products such as ivory, coral, jade, grizzly bear teeth, shells, and amber. While some commoners might obtain some of these products, most were obtained by the elites. Chiefs also commissioned

and encouraged artisans to make exotic things such as insignia for the ruler. We can see from the extensive network of *caciques* (a hereditary ruler from a locality who was akin to a chief) across the breadth of Latin America that tradition favored the persistence of chiefdoms.

The power or authority of the chief was not total but instead was contingent upon consensus rather than absolute power. Indeed, a chief really possessed no independent powers and could not undertake any policy or project that the majority of his people did not want carried out. Nonetheless, the images of chiefdoms as personified by plazas, mounds, stone monuments, and sculptures can be found throughout Mesoamerica yet are almost totally nonexistent in monumental architecture. Only in states do rulers have total power (until they are reined in by forces of democracy and constitutionalism) and can undertake nearly anything they want because they control the apparatus of the courts, police, and military force. It is largely believed by a large number of scholars that states arose because of a need such as is evidenced by the vast irrigation system of ancient Egypt, where central coordination was needed to ensure ample harvests. Only the states of the central Mexican basin developed anything that might be called states. The Maya as well as others relied on a network of chiefdoms to achieve the ends similar to what might be called a state. What we call states of the ancient world are not on the scale and extent of what we call nation-states in the more modern world.

Late Pre-Classic and Early Classic Maya City States

Many of the best known Maya city-states (Tikal, Copan, Uxmal), as well as those less well-known (Calakmul, El Mirador, Uaxactún), rose to prominence in the Late Pre-Classic and Early Classic

periods of Mesoamerica (300 BCE to 450 CE). This florescence created a kind of “golden age” in Mesoamerica marked by elite, literate societies, advanced mathematics, and the massive architectural complexes that became the hallmark of Maya civilization. The early city-states shared a degree of influence from contemporaneous civilizations—Teotihuacan, Monte Alban, Izapa—as well as a historical influence from the Olmec civilization, from which they derived traditions of bar-and-dot numeration, ritual ball games, and blood sacrifice. Despite these similarities, each city-state maintained distinct characteristics and political autonomy.

Kaminaljuyu at its apex may have been one of the most impressive early Maya centers, though the site has been subject to deterioration and looting as a result of its location under the rapidly spreading Guatemala City. Unlike many other Maya cities renowned for their stone architecture, inhabitants built house platforms, temples, and other structures at Kaminaljuyu from hardened adobe brick that they then adorned with carved stucco masks and painted murals. Scattered among the architecture, archaeologists and others have recovered a wide variety of effigies including images of flattened frogs (*ranas aplastadas*), bats, jaguars, serpents, and fat human figures in a variety of styles suggesting a cosmopolitan or multiethnic community. Also included in the sculptural elements of Kaminaljuyu are large stelae on which people recorded some of the earliest calendar dates in the Maya world as well as relief images of important personages attired in lavish costumes and performing acts associated with divine Maya rulership. The city inhabitants also created significant water control features and earthworks, which attest to the early development of social hierarchy, high population density, and concentration of political power.

Tikal would not reach its apogee until the end of the Classic period (200–900 CE), but its early architecture and sculptural traditions demonstrate a precociousness when it comes to the power of the elite and their ability to command. Tikal initially occupied only a secondary status compared to its northern neighbors, Uaxactún and El Mirador. However, as those other early centers fell into decline after about 1 CE, Tikal

► CREATING DIVINE KINGS

One of the most notable features of Maya civilization is the concept of rulers who were not just elite, but actually divine. While this concept was not unique to the Maya, it does raise questions as to how people were able to change their status from that of an ordinary mortal to a deity incarnate with supernatural powers. Some archaeologists have suggested that by studying the emergence of Maya city-states we may be able to see how people and societies made that transition. To do so, however, requires looking not only at the monumental architectural complexes so closely associated with the Maya elite, but also at residential compounds.

One argument suggests that as households promoted their social status through public rituals and ancestor veneration, they were able to claim divine origins not only for their ancestors but eventually for themselves as well. Elites may have used their ties to distant cultures such as Teotihuacan, incorporating foreign images and icons, as a way of demonstrating their esoteric knowledge.

Archaeologically, funeral remains from early Maya sites are found earliest in household contexts. As burials became more lavish, people established separate funerary chapels with important dead relatives buried in chambers in the base. Over time these structures were renewed and reconstructed with the newer construction encasing the older structure.

Also critical to this process was the creation of agricultural and other forms of surplus which in turn required control over water supply and trade routes. Evidence suggests that the ability of the elite to control essential water supplies directly influenced population density and dense populations were critical for building projects and for staging ever-larger public rites. Control of trade routes provided the elite with rare items such as obsidian, jade, stingray spines, hematite, and marine shell that were used to indicate their elite status and complete the ritual attire that marked them as deities.

—Jo Ellen Burkholder

emerged as a major Maya center, though it was often at war with other Maya cities. This difficult position may explain the many miles of dry moats and ramparts along the northern and southern perimeters of the site. Funerary customs at Tikal indicate the emergence of elites in that city. After death, elites at Tikal (beginning in the Late Pre-Classic) were placed in stone-lined tombs and furnished with luxury items of jade, jadite, stingray spines, spondylus shells, ceramics, and human sacrifices. Many of the early tombs, platforms, and temples at Tikal cannot be seen today because Middle and Late Classic structures were built over and around them. Still, many of these early structures established the location and basic spatial organization of the city's monumental architecture. As early as the third century, stelae record evidence of dynastic succession, the earliest in the Maya realm.

Copan, like Tikal, is better known today for its Late Classic architecture, but also had an earlier history. Located in a pocket created by a meandering Copan River, archaeologists have struggled to get a sense of early Copan. Sparse

textual references and materials indicate that Copan was a significant center in the last centuries BCE. This is in part confirmed by erosional cuts at the site which have revealed traces of earlier architecture within the city's core. The history of royal succession at Copan begins in 426 CE when K'uk Mo' Ajaw from the city of Tikal established a new dynasty under the name K'inich Yax K'uk Mo'. This foreign royal likely married a local elite woman. Building and structural modification begun under early dynastic rule employed an architectural style reminiscent of Tikal, Kaminaljuyu, and Teotihuacan, suggesting an awareness of, if not participation in, a broader Mesoamerican sphere of interaction. Later generations produced more uniquely Copan-styled materials including figures nearly in the round.

Uaxactún is significant as one of the Maya cities that has been inhabited the longest, with initial occupation dating to the first or second millennium BCE and lasting through the ninth century CE. By the last centuries BCE stone architecture had begun to replace earlier structures of wood and thatch. As at other Maya sites

with long histories, these early architectural units formed the foundation for later building complexes. At Uaxactún these include structures at the heart of a complex known as Group E, noted for its astronomical alignments for the solstices and equinoxes. Many early public structures supported large stucco masks in the form of a *witzob* or Witz Monster, the mythical representation of a living mountain. Archaeological work in domestic sectors of Uaxacatun has revealed the importance of household rituals and craft production, such as weaving and shell working, to the processes of gender and class differentiation that marked Classic Maya civilization. Early Classic Uaxactún engaged in competition and warfare with its neighboring cities and like Copan also came under the influence of Tikal in the early part of the Classic period.

Several characteristics evident in all of these early Maya city-states reflect the beginning of traits that define Maya civilization as a whole. The cities themselves underwent tremendous growth, many evolving from essentially rural settlements to true urban concentrations with the aid of water control features essential to supporting large populations. Within these cities, social differentiation led to the formation of elite classes of nobility and ultimately to divine rulers who were entombed in the base of what became stepped-pyramid temples. These early structures formed the basis for the monumental architectural core at many sites. Divine rulers created the tradition of erecting monumental stone stelae to record their accession to the throne, battles with other cities, and temporal landmarks in their reign. It is as a result of this tradition that archaeologists and epigraphers have been able to piece together so much of the complex history of the Maya people. Later Maya dynasties expanded and elaborated on these traits, giving a unique cultural stamp to the ever more powerful realms they controlled.

Monte Alban and the Zapotec Civilization

The site of Monte Alban stands as the foremost reminder of the grandeur that was Classic period Zapotec civilization. Located in the heart of the Oaxaca Valley, this mountaintop city and ceremonial complex emerged as a small settlement after 500 BCE, but by 200 BCE Monte Alban had become the preeminent center of religious, political, and economic life in the Oaxaca region and one of the largest cities in the Americas at the time. In doing so it eclipsed the influence of settlements in the three branches of the Oaxaca Valley and came to exert an influence on places much farther afield. The secret to Monte Alban's success, and with it the rise of Zapotec civilization, is still a matter of debate, and scholars have attributed it to combinations of military/strategic, economic, and religious causes. The influence of other large polities contemporaneous with Monte Alban, such as Teotihuacan, impacted but did not determine or control developments in Oaxaca.

Archaeological surveys of the mountain on which Monte Alban sits have found no evidence that people occupied its slopes prior to the Monte Alban I phase (500–200 BCE) even though the Oaxaca Valley itself has a long history of human occupation. In fact, the center of the valley surrounding the site appears to have been a kind of no-man's-land separating smaller political units in the valley's three branches: Tlocolula, Etla, and Valle Grande. After 500 BCE a fast-growing settlement developed on the mountain slopes. By about 200 BCE the site incorporated 160.6 acres (65 hectares), including three discrete but adjoining settlement zones that some archaeologists interpret as areas domi-

➤ CHANGING PERSPECTIVE ON CERAMICS AND EMPIRE

How do archaeologists know when one prehistoric culture came to dominate another, and how do they determine the nature of that relationship? Because archaeologists traditionally deal with preliterate societies, they have no written documents to use as guides to understanding these relationships and must rely on physical remains instead. A perennial source of this information has been ceramics, but what those ceramics indicate about ancient social relationships has been evolving over time due to changes in both technology and interpretation. This has impacted the way we think about the nature of places like Monte Alban and the influence it had on the Mesoamerican world.

Earlier generations of archaeologists interpreted the spread of ceramic styles as the spread of people themselves, an argument sometimes referred to as pots = people. The dramatic appearance of Monte Alban-style ceramics known as gray-ware and cream-ware represented to archaeologists the intrusion of people from Monte Alban into neighboring and distant sites. The dominance of the Monte Alban wares in ceramic assemblages further suggested not just the

presence but the actual domination of people by the Zapotec state.

Three things have begun to change this basic pots = people argument. First, the introduction of fine-scale analysis of ceramic pastes, including chemical analyses such as neutron activation analysis, now allows archaeologists to look beyond the superficial similarities of ceramic style and allows them to identify important differences between “imported” original pottery and local reproductions of the same style. Second, ethnoarchaeological studies of modern small-scale pottery production have given archaeologists better insight into what the processes of production really are, allowing for better interpretation of why people would either import or make copies of different pottery styles. Finally, realizing that ancient states used a variety of tactics to achieve political and economic control over other regions has led to a broader consideration of the role that pottery styles might play in imperial expansion. As a result, archaeologists still view Monte Alban as a powerful pre-Columbian state but no longer think that its influence was exclusively military.

—Jo Ellen Burkholder

nated by former residents of the different valley branches. The site also included the beginnings of a ceremonial center on the top of the mountain, though many of the original structures were later obscured by expansion and remodeling. A defensive wall 1.8 miles (3 kilometers) long along one side of the burgeoning city suggests that defense may have been a significant factor in site selection. Population estimates for the city by 200 BCE top 16,000.

The initial development of the urban center at Monte Alban happened in conjunction with major population shifts in the greater Oaxaca Valley, attested to by archaeological settlement surveys. The Oaxaca Valley grew in overall population, but this growth was not evenly distributed. San José Mogote in the Etla branch of the valley had previously been the largest and most influential settlement in the region, but with the development of Monte Alban, however, San José Mogote and other large sites in other branches

of the valley lost significant population or became uninhabited. At the same time, several other new settlements sprang up clustered in the area covering 7.7 square miles (20 square kilometers) around the emerging city of Monte Alban. Elite people living at Daínzu, Monte Negro, Abasalo, Tomaltepec, and other sites probably competed initially for economic and social status with the elite at the emerging center of Monte Alban.

Archaeologists believe that during the Monte Alban II phase (200 BCE–250 CE) a distinctively Zapotec state began to develop, with its capital at Monte Alban. Evidence cited for a more unified state emerging includes the massive terracing and construction work in the mountaintop ceremonial complex at Monte Alban. These large public projects speak to the ability to generate food surpluses and to control significant amounts of labor as well as to increased formality in religious practices and social/political organization.

Buildings of the Monte Alban II phase exhibit a distinctive architectural style including terraces, colonnades, sloping balustrades, two-room temple design, and subterranean elite tombs, all echoed at other Zapotec sites. Monuments incorporated into the new buildings at Monte Alban bear inscriptions understood as dates and place-name glyphs, and many include an inverted human head, suggesting conquest or dominance.

The Monte Alban III phase (250–700 CE) marks the apogee of the Zapotec state at Monte Alban. The mountaintop city reached its peak population of about 24,000 residents, with an additional 31,000 in small communities surrounding the larger site. Monuments in the principal ceremonial area on the flattened mountaintop reached their final forms. This included additional inscribed stelae that depict a bound captive standing on a small pyramid with a place-name glyph; a glyph signifying conquest appears within the pyramid below the captive. Zapotec artists perfected their skills during this period, producing colorful murals; exquisite pottery; jade, shell, and metal ornaments; elaborate masks; feather work; and clothing.

During the Monte Alban III period the Zapotec also expanded and maintained relationships with people well beyond the Oaxaca Valley. Most certainly this included Teotihuacan and the intermediate Ñuiñe region but may also have included places such as Cholula, Kaminaljuyu, and the Isthmus of Tehuantepec. Evidence of this relationship includes the presence of imported and imitation trade ceramics at Monte Alban, Zapotec ceramics and inscriptions at other sites (e.g., Teotihuacan and Chiapa de Corzo), and carved representations marking the visits of foreign emissaries. The equity expressed in the depiction of emissaries and the continued distinction in regional ceramic styles suggests that diplomacy rather than warfare characterized these relationships.

After 700 CE Monte Alban as a city fell into decline. Though expressions of Zapotec culture remained strong into the colonial era, Zapotec and Mixtec cultures began to blend as people from the rising Mixtec polities moved down the Etlá branch of the Oaxaca Valley.

What prompted the changes in the Oaxaca Valley is uncertain. On one hand, archaeologists

note that the drastic change in settlement patterns in Oaxaca resemble the *synoikism*, or rapid coming together, seen in some Greek city-states in times of threat. While the depictions of mutilated enemies in early monuments (like Building L at Monte Alban) certainly suggest that warfare played an important role, the use of personal name glyphs rather than place-name glyphs in these same monuments suggest intra-ethnic conflict rather than threat or warfare from people outside of the Oaxaca Valley; the monuments appear to name other Zapotecs rather than people from places farther away.

On the other hand, some archaeologists have looked to the environment to explain changes at Monte Alban. Development of irrigation technology that allowed for agricultural exploitation of valley flanks, or piedmont zone, coupled with an existing wealth of biodiversity provided for an economic surplus that could be manipulated by the elite to fund status-enhancing activities such as monument construction and for sponsorship of ball games and religious rituals. Through expansion, the Zapotec branched out to control and manipulate the resources of other areas as well, spreading their influence and concentrating even more resources in the hands of Zapotec elite. Given the relatively small population of the Oaxaca Valley (40,000), it is likely that economic imperialism rather than military domination played a significant part in the Zapotec expansion. In this sense, the individual actions of aspiring elite, rather than the environment, played an essential role in the concentration, manipulation, and exploitation of social, economic, and technological resources.

Cultures of the Andes

As Chavín influence receded and then collapsed after 200 BCE, an increasingly decentralized, militarized landscape emerged in the pre-Hispanic Andes. Two powerful civilizations arose. Neither of them united the region as the Chavín had. These civilizations are called the Paracas/Nazca, who inhabited southern Peru, and the Moche, or Mochica, who dominated the northern coast. This period, through approximately 600 CE, is termed ancient Peru's Early Intermediate period.

The Paracas culture (ca. 600-175 BCE) inherited and then improved upon earlier Pan-Andean traditions, including religious practices involving anthropomorphic imagery and highly sophisticated mummification techniques. Andean peoples and cultures, particularly those occurring in desert environments, had mummified their dead for thousands of years. Paracans clothed their mummified dead in what remain the finest, most elaborately embroidered textiles in the pre-Hispanic Andes.

The Nazca culture (ca. 200 BCE-600 CE) is associated with the Paracas culture for geographic, technological, and artistic reasons. They are separated for chronological reasons; furthermore, they occupied the same specific sites in southern Peru. Trophy heads, to cite but one common thread, appear in Paracas textiles and at the Nazcans' ceremonial center, Cahuachi. Such centers, it is believed, drew people on pilgrimages from the surrounding area for religious purposes. But few if any resided there. Indeed, no capital cities or evidence of social hierarchies appear in Nazcan remains. The Nazca culture does not appear to have represented an empire or other kind of state, then. Little is known about Paracas/Nazca political history.

Peruvian mummy bundle from the Nazca culture on the southern coast of Peru, 200 BCE-600 CE. (Gianni Dagli Orti/Corbis)

DEVELOPMENT OF NAZCA AND MOCHE

► SIPAN'S LORDS AND MOCHICA MILITARISM

Ancient Peru's Early Intermediate period featured decentralized, militaristic peoples and cultures. Mochica elites and their sacrificial rituals, as seen through the royal tombs at Sipan and as correlated with the art-historical record, illustrate this.

The Mochica limited their military adventures to individual combat primarily designed to capture sacrificial victims. Warrior-elites employed large clubs, spear throwers, slings, and shields on open battlefields. They stripped their captives, tied their hands behind their backs, and led them by ropes around their necks to ritual centers. Costumed warrior-priests—men and women—then treated their captives with anticoagulants, cut their throats, and consumed their blood. Later, they dismembered the bodies and displayed trophy heads.

This ritual occurred across time and space during the Moche period, implying a regionwide state-religion. Furthermore, the art-historical record suggests that by capturing and tying their victims and then consuming their blood, these warrior-priests consciously emulated spiders. Ethnohistorian Alana Cordy-Collins has shown how those playing the decapitator role resemble spiders in Mochica art.

—James Douglas Lockhart

Nazca culture is also associated with the large-scale man-made geoglyphs and other abstract geometrical imagery—including straight lines—that appear in the landscape. This imagery covers more than 1,000 miles (1600 kilometers) of space in southern Peru. It has long intrigued scholars and other observers. The geoglyphs include, for example, a killer whale, a condor, and a hummingbird. Since these giant geoglyphs can only be appreciated from above, in the air, some have assumed that the Nazcans engineered them for religious purposes; the geometrical shapes and lines may have related to astronomical observations.

Ethnohistorians Anthony F. Aveni and Gary Urton have challenged this interpretation. They suggest that Nazcan engineers intended ground-based purposes. When viewed as footpaths, they appear as a network of trails that converge on strategic points related to waterways and ca-

nals. The interpretations, based on little data, remain inconclusive. It is not even certain that the Nazca culture designed and constructed all the imagery. That is, others—for example, any of their neighbors or successors—may have imitated them and superimposed at least some of the imagery for their own purposes, perhaps even long after the Nazca period.

Meanwhile, the Moche civilization (ca. 0–800 CE) emerged on Peru's northern coast in or near the region's river valleys from the Piura to the Huarmey. Archaeologist Max Uhle discovered and excavated the pyramids at and around the Moche in 1899 CE; Uhle named the entire civilization Moche. As with the Paracas/Nazca, it is not known what the Mochica called themselves. The Mochica, too, inherited and improved upon earlier Pan-Andean traditions. Their political economy likely involved redistribution, for example.

What is known of the Moche civilization derives from monumental remains, those royal burials that private collectors have not sacked, and the art-historical record. Mochica elites appear to have ruled independent kingdoms connected by a regionwide state religion. These elites wielded immense power, accumulated vast wealth, and radiated grandeur. They presided over trade networks that reached into modern Ecuador and northern Chile. They had little or no contact with the lower classes.

Mochica elites buried their wealth with them when they died. This included solid gold head-dresses and gilded tunics, among numerous other lavish artifacts. Their successors demanded their own clothing, furniture, and artwork. And this dynamic engendered and cultivated a technological and artistic florescence in north coastal Peru through the end of the Moche period. The Moche civilization declined and fell after an apparently unusually powerful and long-lasting El Niño (ENSO) weather pattern flooded the region circa 600 CE.

Development of Chavín

The Early Horizon Chavín civilization united Andean peoples and cultures in the first millennium, roughly between 800 and 200 BCE. This Pan-Andean politico-religious force originated from the northern highland Chavín de Huántar site, strategically located in modern-day Peru's Cordillera Blanca, roughly midway between the northern and southern coastal lowlands to the west and Amazonian tropical rain forests to the east, where natural trade and communications routes intersected. The Chavín influenced regional politics, religion, commerce, architecture, and art from this center.

Although historians associate the Chavín with the origins of Andean civilization, just as

they associate the Olmecs with the origins of Mesoamerican civilization, the Chavín, like the Olmecs, absorbed and incorporated earlier regional developments in food production, textiles and ceramics, and architecture and art. Like many from the Late Initial period, the Chavín apparently relied on religion as their primary organizing mechanism.

The Chavín began construction at their earliest monumental center, the so-called Old Temple, circa 900 BCE. Here they performed rituals that played on Native Americans' understanding and fears of the supernatural world. The U-shaped Old Temple featured architecturally based illusions, including larger-than-human anthropomorphic heads that towered above observers. A sunken circular plaza seated approximately 500 people outside the building. This plaza also displayed the Chavín's typically anthropomorphic and zoomorphic imagery, including fanged human faces growing snakes for hair, for example.

Inside, the Old Temple contained several hidden passageways and rooms. Many received little or no sunlight. Archaeologist Julio C. Tello

► PRE-HISPANIC ANDEAN HISTORY AND ITS PROBLEMS

Historians face several challenges and obstructions with respect to pre-Hispanic Andean history, particularly pre-Incaic peoples and cultures such as the Chavín. Did the Chavín civilization represent an empire or a religious cult, for example? Who built Chavín de Huántar, for that matter, and why? What were their politics? Experts lack direct historical records that might address such issues.

That which is known derives entirely from the archaeological and art-historical record. Consequently, archaeologists and art-historians—not historians—dominate this field. Pre-Hispanic Andean peoples and cultures apparently expressed their language orally and, in some cases, pictorially. But they did not develop writing. They did record much information on *quipus*, a unique data storage and retrieval system. Ethnohistorian Gary Urton believes that quipus potentially carry historical narratives. But scholars cannot read them at this time. And, in any case, precious few remain available for study.

This means, for example, that experts lack the equivalent of the Homeric legends that adventurer Heinrich Schliemann relied on when he searched for Mycenae in the nineteenth century. The Chavín apparently lacked a Herodotus or Thucydides who might have recorded their political history as well. Thus, one cannot describe Chavín and pre-Hispanic Andean history the way one might describe Mycenaean and classical Mediterranean history at this time.

Compounding this, the Incas revised Andean historical traditions after they built their empire. The oral traditions treating pre-Incaic Andean history that sixteenth-century Spanish chroniclers recorded include these distortions and corruptions. Moreover, many Western concepts and much Spanish-language vocabulary pervade early colonial chronicles and much of the scholarship that has followed. These limitations may not prove fatal to scholars' endeavors, but it is important to keep them in mind when exploring pre-Hispanic Andean history.

—James Douglas Lockhart

discovered El Lanzón, the Chavín's 15-foot (4.5-meter) tall supreme deity and idol, a massive anthropomorphic figure upon which the entire structure centered, in the early twentieth century. Art-historian Rebecca Stone-Miller has pointed out that there is no evidence to show or suggest that any humans ever observed El Lanzón directly. Nevertheless, scholars believe that Chavín shamans or other authorities might have consumed mescaline and other hallucinogenics to consult this oracle, apparently their primary conduit to the supernatural world.

The Chavín's authority spread over the Andes from this temple. Local peoples and cultures constructed and maintained Chavínoid (the scholarly term for material culture that imitates or is influenced by Chavín styles) subsidiary religious centers as earlier independent Late Initial period societies collapsed. They also exchanged Chavín-style artifacts and artwork far and wide. Chavín de Huántar functioned as the center of exports and imports with respect to these cultural and commercial exchanges. And archaeologists at this site have uncovered what appears to have been tribute—including gold, exotic shells, and other precious commodities—from northern and southern coastal areas.

Meanwhile, the Chavín continued to renovate and expand the Old Temple. By circa 500 BCE the so-called New Temple, a much larger structure, appeared at Chavín de Huántar. It featured more sophisticated imagery, particularly depicting the supreme deity, culminating in the Raimondi Stone. But by approximately 200 BCE Chavín influence had declined and collapsed, however.

Widespread upheavals of an unknown origin and nature precipitated this collapse. At many sites, including Chavín de Huántar, archaeologists have uncovered unfinished construction projects, entire monumental centers abandoned, and destruction. Archaeologist Richard L. Burger, perhaps the most authoritative English-language source on the Chavín, also points to an increasingly militarized Andean landscape, featuring newly constructed hilltop fortresses and other defensive architecture, after 200 BCE. Thus, the Early Horizon's unity fragmented into the Early Intermediate period's isolated polities.

Debating Hopewell Social Structure—Chiefdoms or Egalitarian Communities?

Hopewell-style sites, famous for large-scale geometric patterns, stretch from the Great Lakes to the Gulf Coast and radiocarbon date between 200 BCE and 400 CE. Part of the 2,000-year “moundbuilder sites” earthwork tradition of eastern North America, Hopewell society fits chronologically between the less complex Adena phase and the more complex Mississippian phase. The 1848 survey project by Squier and Davis confirmed the vast spatial extent and complexity of moundbuilder sites and began a debate over the proposed complexity of societies in ancient North America. The Hopewell phenomenon was the logical intermediate link between an egalitarian past and complex societies of the future, but a century of research has failed to clarify the picture.

Hopewell sites are more complex in size, use, construction, and function than earlier Adena sites with geometric forms, astronomy alignments, larger populations, and larger interaction zones. Trade items from across North America, especially obsidian from the Rockies, cold-hammered copper from Lake Superior, and mica from southern Appalachia, indicated complex trade by land and rivers. Larger sites and mounds such as at Hopewell contain burials with exclusive goods (copper and stone decorative items) in far greater quantities than at smaller sites. Road systems may have linked sites together, suggesting hierarchy across the landscape. The presence of site-size hierarchy, differential burials with scarce goods, and exclusively linked sites all suggested a stratified society by individual and by group/site. But was the Hopewell phenomenon really a complex society?

Genetic evidence in a study by Bolnick and Smith from burials at several Hopewell sites, including the Hopewell Mound Group and the Pete Klunk Mound Group, examined maternally inherited relations in and between sites. Surprisingly, no evidence of rank or status was found. This contradicted the archaeological evidence noted above. Instead, migration and gene flow were evident between the Hopewell sites examined. So, were the Hopewell and other moundbuilders negotiating social power by other means?

Researchers must now answer more difficult questions such as who built the Hopewell sites, who used them, and when and for what purposes? Insights may lie in comparing Hopewell to other societies that modified large landscapes such as Chaco Canyon in the U.S. Southwest, the Nazca in Peru, and megalithic builders in Europe. A holistic adaptation seems shared by such groups that code their worldviews into a complex built environment that evolves over time and space. These modified landscapes and sites share integration of geometric patterns, astronomical observations, natural cycles, the world of the living (villages), and the world of the dead (mortuary sites), representative of the local social adaptation to a complex environment.

Perhaps the questions we ask need reframing. Did the Hopewell see themselves as complex compared to their neighbors? Were Hopewell populations sufficient to warrant social complexity? Both questions are difficult, as we need to get at the ancient Hopewell worldview. For instance, did the Hopewell see their society served by these sites as just the living, or were the ancestors included? Were neighboring societies seen in the same worldview?

■ Introduction: Imperial Structures, Bureaucracies, and Administration

Large empires appeared throughout the world during the period from 1000 BCE to 300 CE. The growth of empires is one of the hallmarks of this period, including the Han in China; the Romans in Europe, Africa, and Asia; and the Parthians in Asia. Although historians use the term “empire” in a number of ways, usually it refers to a type of political organization in which a small core territory controls a larger periphery, usually acting to the advantage of the core at the expense of the periphery. The following entries seek to illustrate some of the varieties of imperial governance and administration from 1000 BCE to 300 CE.

—Kevin M. McGeough

Neo-Assyrian and Neo-Babylonian Empires—Imperial Structures, Bureaucracy, Administration

In the earlier first millennium BCE, Assyria became the dominant power in the Near East due largely to its professional and effective army. Within Assyria proper (*mat asshur*, “the Land of Ashur”), which stretched as far west as the Euphrates Valley, the Crown made grants of land to dependents in return for a proportion of their produce, corvée labor, and military service as irregulars, continuing the ancient *ilkum* system. Militarism underlay the whole state, with most

➤ NEBUCHADNEZZAR AND BABYLON

Building records extol the major works that Nebuchadnezzar undertook in restoring many cities of Babylonia and repairing and embellishing their shrines. Babylon benefited especially. To defend the city, Nebuchadnezzar restored, strengthened, and extending its walls, later regarded by the Greeks as one of the Wonders of the World. He rebuilt and extended the quays and canals within the city and the canal network beyond, facilitating water transport. One use of this was to bring in the valuable timbers, such as cedar, ebony, and sissoo wood, and precious materials, including gold, silver, lapis lazuli, and ivory, to embellish major buildings of the city. These included the Southern palace, which Nebuchadnezzar restored, adding new courtyards with many rooms, and a new North palace. He rebuilt the great Processional Way and constructed the Ishtar Gate, decorating both with glazed brick friezes of bulls, lions, and dragons. In the precinct of Marduk, vandalized by Sennacherib, Nebuchadnezzar completed the restoration work undertaken by his predecessors, overlaying the shrines with gold. He also completed the reconstruction of the great ziggurat, Etemenanki (the “Tower of Babel”).

—*Jane R. McIntosh*

officials holding both civil and military posts and every man being obliged to serve in the army if required, while the king was also the commander in chief. All landowners were directly responsible to the king, who, as in former times, was answerable to the gods, especially Ashur. Through time, power was transferred away from the traditional landowning elite; as the Crown gained control of an increasing proportion of the land, it granted estates to bureaucrats and generals.

In the conquered lands beyond the Assyrian heartland, vassal kingdoms were ruled by governors drawn from local dynasties or prominent local families. They paid tribute (often enormous quantities) to their Assyrian overlords and acted in concert with them. Much of the wealth from provincial tribute was used to create and decorate new Assyrian capitals and to support the royal court and central administration.

In the ninth century the Assyrians began to establish military outposts in conquered territory, supported by local taxes. These became administrative centers, developing into regional capitals. It was not until the eighth century under Tiglath-Pileser III that the Assyrians actually began to take direct administrative control of conquered territories, dividing them into numerous small provinces under Assyrian governors instead of local rulers. The changeover occurred gradually, vassal states passing into direct rule when they rebelled.

Military force backed bureaucratic authority, and Assyrian actions were seen as the will of the national god, Ashur. The highest officials were the majordomo, who had direct access to the king; the vice-chancellor, who acted as the king's scribe; and two field marshals, who could deputize for the king on the battlefield. Other high-ranking courtiers who also held senior military offices included the cupbearer, the steward, and the palace herald. Under Tiglath-Pileser the army became a professional body with an elite cavalry core. A network of roads and an efficient messenger service kept the king in control of the army and the administration. Tiglath-Pileser deported troublesome conquered peoples on a scale hitherto unknown. The deportees were often kept together as a community, frequently working as farmers or on large state construction projects, and were generally well treated.

High court officials held the governorships of provinces, and lesser provinces were ruled by less senior officials. A provincial governor maintained his own court and was backed by a standing army, supported from local taxes. The province was regarded as the governor's private estate, a temptation to extortion or the exercise of independent rule, though governors were generally honest, loyal, and conscientious. Bureaucrats were frequently illiterate, but the administration employed many scribes. Although most officials were Assyrians, foreigners in principle could also become part of the bureaucracy.

The Assyrians increased agricultural productivity, founding new settlements and estates in both the Assyrian heartland and the provinces under Assyrian generals and senior bureaucrats and using deportees as labor. Conquered peoples

also made up an increasingly large proportion of the armed forces; by weakening loyalty to the regime this contributed to its eventual downfall. Another factor was the imbalance between the center and the provinces: the latter were drained of manpower and resources to aggrandize the former, causing economic depression.

Among the Assyrian provinces, Babylonia was a special case. Assyria needed peace along its southern frontier, and periodic hostility had to be dealt with. For several long periods Babylonia was under Assyrian control, but the respect felt by the Assyrians for the elder state meant that it was not treated as a conquered land and not administered as an ordinary province but instead was brought directly under royal control. When Babylonia attempted to throw off Assyrian rule, it did not suffer the usual brutal retribution for subordination. When Sennacherib sacked Babylon after a long succession of wars, this was widely viewed as hubristic and impious, and his son Esarhaddon lost little time before attempting to restore the city. After the long reign of Esarhaddon's son Ashurbanipal under whom Babylonia prospered, Assyria rapidly declined, enabling Babylonia to gain control of the whole Assyrian empire by 610 BCE.

For much of the first millennium Babylonia had been riven by internal conflict, particularly between the urban north and the powerful Chaldean tribes of the south; had been undermined by Aramaean raids; or was at war with Assyria. A literary text, "King of Justice," describes the abuses that prevailed in periods of disorder: the weak oppressed by the strong, unable to obtain redress, and judges perverting justice. There had, however, also been significant periods of peace and prosperity, some under Assyrian control, others under native kings. One such was Marduk-apla-iddina, originally the sheikh of the powerful Chaldean Bit-Yakin tribe, who in 722 succeeded for a time in uniting the disparate factions within Babylonia. Little documentary evidence of Neo-Babylonian administration survives; political texts mainly recorded the pious acts of kings. Marduk-apla-iddina, acting as Marduk's representative on earth, claimed to have acted as a model ruler, restoring temples, maintaining irrigation systems, and following tradition, such as upholding cit-

ies' ancient privileges. Officials mentioned in a *kudurru* (land grant) text show that governors of cities and leading officials of major temples as well as the king and his entourage played important roles in Babylonian administrative organization.

A later text, from Nebuchadnezzar's reign, shows that officials were bound by an oath of allegiance sworn personally to the king. Documents refer to various different local authorities: tribal sheikhs in Chaldean and Aramaean districts, governors of cities and Babylonian districts, and client kings or pro-Babylonian native officials in provincial districts where possible, though some were under Babylonian governors. Their responsibilities were probably similar to those of earlier Assyrian administrators, including collecting taxes and promoting agriculture, industry, and trade. The Babylonians derived substantial tribute from subject lands, as had the Assyrians. Babylonian texts, however, emphasize the role of the king as the source of justice and fair rule for subject peoples as well as Babylonians. Like the Assyrians, the Babylonians used people deported from rebellious regions to settle land and increase agricultural production or to work in various industries.

Under Neo-Assyrian and Neo-Babylonian kings, the temple became an integrated part of the political structure. Endowed by the king with substantial lands, the temples were given a considerable measure of responsibility for their local community, with temple officials acting as local judges and presiding over district assemblies. They collected tithes from the citizens of their districts and paid a proportion of these to the Crown. They also had to provide labor and resources as the palace required, such as pasturing royal herds and provisioning royal officials. Temple accounts and activities were open to scrutiny by royal officials.

Some texts refer to traditional privileges enjoyed by the citizens of Babylon, Nippur, and Sippar, including exemption from corvée labor, taxation and army service, and some degree of civic and judicial autonomy. This privileged status (*kidinnutu*) was formally recognized not only by Babylonian kings but also by many Assyrian rulers.

Achaemenid Empire—Imperial Structures, Bureaucracies, and Administration

When Cyrus the Great created the Persian empire through his conquests, he faced the task of governing a vast territory made up of many different cultures. His practical solution was to make use of the administrative systems already in place in the different conquered regions. In major states such as Media and Babylonia he inherited complex bureaucracies; in much of the Levant and Anatolia he was dealing with city-states and small kingdoms, while in many other regions there were looser political structures, including tribal groups under petty chiefs. Cyrus appointed Persian nobles to supervise many regions but retained some local rulers and most lower-ranking local officials.

Cyrus derived considerable wealth from the treasuries of conquered states. Revenue was raised in several ways but was conceived of as gifts. The king rewarded his supporters with gifts, such as land confiscated from defeated enemies. In return they presented him with some portion of their estates' annual produce and provided troops as required. The support of local elites was secured with gifts and honorable but largely powerless appointments.

When Darius I seized the Persian throne in 522 BCE, he completely overhauled the administrative organization of his empire, creating an enduring system that was efficient but flexible. He commissioned the compilation and codification of each region's laws to enable his adminis-

tration to uphold and enforce them. Similarly, although Imperial Aramaic was used throughout the empire in the higher tiers of government and administration, regional languages were used at a local level.

Darius divided the empire into provinces (usually referred to as satrapies), each under a Persian governor (satrap) drawn from the king's family or inner circle. The number of satrapies varied through time due to further conquests and other political changes. Herodotus, writing in the mid-fifth century, lists 20. Many corresponded to previous political divisions, including Egypt, Media, and Babylonia, later divided into Babylonia (including Assyria) and Abarnari (Beyond the River), comprising western Syria and the Levant. The number and extent of satrapies in Anatolia varied in response to revolts and conflicts between local rulers. Other provinces divided up the Iranian plateau and the lands to its north and east. The Persian homeland, in southwestern Iran, was treated differently from other provinces, such as being exempt from taxation. The king maintained a substantial royal staff: some traveled with him, while others resided in the imperial capitals (Susa, Persepolis, Ecbatana, Pasargadae, and Babylon) and other important centers. Neither the king nor his nobles were literate. The Persians set more store on active skills, such as horsemanship and excellence with the bow and spear, and on oral learning, particularly by observing in the law courts.

Darius assessed the wealth and productivity of the provinces and fixed the tribute due from each, calculated in talents of silver although in reality some of the tribute was delivered in kind, as is so vividly depicted on the Tribute Reliefs at Persepolis. Gone was the notion of gifts except in the case of communities under looser control; these included Zagros nomads and the Scythians, who provided many soldiers for the imperial armies, and the Arabians, who gave annual gifts of incense. In return the king presented prestigious gifts to their leaders and might also offer them military assistance.

The satrap was responsible for collecting tribute and other taxes and transmitting them to the king; using taxes in kind to support himself and his staff, local garrisons, and the workforce

on state projects; and storing some of the silver locally, mainly to pay mercenaries in emergencies although he probably required royal authorization to use it. He also administered justice and maintained the peace, promoted agriculture, and generally ensured the well-being of his province. Treasuries were maintained in some other fortified centers under the control of a treasurer, but much of the silver, along with booty from captured cities and precious gifts from client rulers, was stored in royal treasuries in the imperial capitals. Within each satrapy there were subdivisions, usually under Persian governors but not always: for example, within Abarnari, the kingdoms of Cyprus and the city-states of Phoenicia were governed by their traditional rulers, all answerable to the satrap, who kept them under strict observation. Native officials familiar with the local language and customs controlled smaller administrative units.

Another important satrapal duty was to raise troops from the province. These were under the authority of a military commander, who often cooperated with the satrap but who was directly answerable to the king and personally selected by him from among the highest nobility. Coastal and island communities instead supplied oarsmen for the navy, manning ships built by the state and commanded by noble Persian officers. Nobles favored with gifts of land had variously to supply infantry, cavalry, or chariotry. Their lands might be worked by tied labor; alternatively they could be parceled out to individuals who, when required, had to either serve as soldiers themselves or pay for a substitute. In other cases such individuals held “bowman land” directly from the king. Census records were maintained of all from whom such service was due. In periods of greater stability when troops were not required, landowners paid a tax in silver instead. Armies were raised to conquer new territories or to put down revolts. Troops were present throughout the empire; not only did the king and satraps maintain permanent garrisons in sensitive places, including cities, river crossings, border regions, and imperial strongholds with treasuries, but landowners had their own soldiers to defend their estates. Garrison soldiers could be granted land in the vicinity as well as receive rations from

➤ THE PERSEPOLIS TEXTS

Fascinating details of Persian administration are revealed by Elamite cuneiform tablets found at Persepolis: more than 30,000 Persepolis Fortifications Tablets and 753 Treasury Tablets. Produce from royal estates and other sources was gathered into storerooms at Persepolis and many local centers, while silver and other valuables were stored in the Persepolis treasury. In overall charge of these, answerable directly to the king, was the chiliarch and under him the treasurer, both Persians of noble birth. A few senior officials were responsible for allocating personnel to tasks and authorizing the disbursement of rations to support them, while a large number of lesser officials gave out the orders and rations and assembled the work parties for particular tasks, such as digging irrigation channels or undertaking building work at Persepolis. It is not entirely clear who these workers were: local people performing *corvée* labors instead of military service, laborers deported from other parts of the empire, slaves, or free state employees. There were also groups of craftsmen brought in from all over the empire to exercise particular skills. Work was paid in rations of barley, 30 and 20 quarts per month, respectively, to ordinary male and female workers and 5 quarts to children, while foremen and women and skilled workers received 40–60 quarts of barley and rations of wine or beer.

—Jane R. McIntosh

the state. Documents reveal that Judean soldiers, under Persian officers, garrisoned the fortress on the island of Elephantine, near Egypt's southern border. Across the river in the city of Syene, the district governor maintained a separate garrison.

Taxes were collected on many things including farm produce, fisheries, imports, and access to irrigation water, and the state also derived produce from royal estates. Cuneiform documents found at Persepolis and small numbers of archived texts from regional capitals across the empire refer to the use of taxes in kind as rations issued to state workers, soldiers, and travelers on official business. Occasionally, as shown in the Persepolis Treasury texts, people were paid a part of their ration entitlement in silver,

generally when there was a shortage of barley. It was only in Anatolia, where coinage was used before the emergence of the Persian empire, that a monetary economy operated. Darius created a new coinage in gold (*darics*) and silver (*sigloi*); this was rarely used beyond Anatolia. Later Persian kings and occasionally satraps under license also minted coins, mainly to pay foreign mercenaries.

At the head of the state was the Great King, all-powerful, motivated by the highest principles, and embodying the highest virtues, answerable to none but the god Ahuramazda who had chosen him to counter disorder and uphold peace and prosperity. The king employed local experts to advise him on affairs in different parts of the empire and to act as his agents. There was also a network of spies, the King's Eyes and Ears. Texts show that the king sometimes consulted with his highest nobles, but whatever the advice he might receive, his was the final decision, which none could question but could only obey.

The Parthian Empire

The Parthians were a Persian dynasty from the northeastern Iranian plateau that eventually came to conquer much of the eastern Seleucid empire between the third and first centuries BCE. While we do not have many sources written from the perspective of any of the ancient Persian empires (Achaemenid, Parthian, or Sassanian), the problem is particularly acute when it comes to Parthian history. In order to re-create

a historical narrative of the Parthian empire, historians have been forced to rely on Roman sources, unearthed Parthian coins, and archaeological research. Thus, much of our knowledge about Parthian history dates to the period following Parthian-Roman contact in the first century BCE and deals mostly with Parthian-Roman relations. Still, it bears mentioning that even though the Parthians did not leave behind an abundance of written materials, between the third century BCE and the third century CE they established themselves as the chief power in Iran and parts of Mesopotamia and were able to successfully challenge Seleucid and later Roman power in the east.

Historians do not know exactly when the Parthians appeared on the scene, but by either the early 240s or the late 230s BCE the Parthians had staged a successful local revolt against Seleucid authority in northeastern Iran. After establishing themselves as a small kingdom independent of Seleucid rule, the Parthians conducted diplomacy with their former masters, sometimes forming alliances and other times engaging in armed conflict. During the mid-second century BCE the Parthian king Mithradates I, taking advantage of a weakened Seleucid empire that had recently come into conflict with the expanding Roman state to the west, conquered much of Iran and parts of Mesopotamia up to Syria. Following Mithradates I's death in 138 BCE, the Seleucids went on the offensive and were able to recapture much of Mesopotamia and Iran, possibly even penetrating into the Parthian homeland in northeastern Iran. The Parthians soon turned the tables after a surprise attack that led to the death of the Seleucid leader and struggled to reconquer Iran and Mesopotamia since several independent kingdoms had risen in the wake of the power vacuum following years of Parthian-Seleucid warfare.

At this point, however, a new Parthian leader, Mithradates II, acceded to the throne and led his forces in the successful reconquest of Mesopotamia. Mithradates aided in the creation of an independent Armenian kingdom, which soon became a point of contention between the Parthians and Romans and later the Sassanians and Romans. During the later part of Mithradates' reign (ca. 90 BCE) the Parthians estab-

lished contact with the Romans, although this led to neither immediate conflict nor peace. By this point the Parthians had conquered and secured a large empire that stretched from eastern Iran into eastern Syria and from the Caspian Sea to the Persian Gulf.

By the mid-first century the Romans and Parthians had become the most formidable powers in the ancient Near East. During the first Roman triumvirate, Marcus Crassus—the period's wealthiest but least-capable military leader—used his position as governor of Syria to invade Parthian territory, where his forces were soundly defeated and he lost his life at the Battle of Carrhae. Although the Parthians won the battle, they did not press their advantage but instead preferred to fortify their positions near Roman territory.

Over the next century and a half the Romans and Parthians maintained relatively stable borders, although in terms of overall military strength the Romans were clearly the superior power. Under Augustus and Tiberius the Romans and Parthians exchanged diplomats and even political hostages (members of each group's imperial families who spent time in the other's territory). Both also attempted to use the independent Armenian kingdom to their advantage by intervening in internal Armenian politics. By the late first century CE the Parthians may have suffered from local revolts within their empire, although modern authors are unsure. Regardless of the specific internal events, the Roman emperor Trajan invaded and conquered much of Mesopotamia in the early second century CE, including the Parthian capital at Ctesiphon near the ancient city of Babylon (and also near the present-day city of Baghdad). Trajan's forces advanced as far as the Persian Gulf, although they eventually fell back to the expanded boundaries of the Roman territory in the Near East.

Following Trajan's death, Roman leaders turned their attention elsewhere for the next 50 years until Marcus Aurelius once again invaded Parthia in the mid-160s CE and sacked Ctesiphon before once again falling back to Roman territory. After the death of Marcus Aurelius's son Commodus in 192, the Romans endured a short period of civil war in which the Parthians recaptured minor territories along the Parthian-

Roman soldiers ravage the Parthian city of Ctesiphon, second century CE. (Ridpath, John Clark. Ridpath's History of the World, 1901)

Roman border. The eventual victor of the civil war, Septimus Severus, then invaded Parthia before retreating back into Roman territory to deal with problems in Gaul. In 198 following increased Parthian raids, Severus reinvaded Parthia and once again sacked Ctesiphon.

Although the Parthians had been able to maintain central rule during the second century CE, their military defeats against the Romans had badly damaged the dynasty's prestige among its subject peoples, including many Persian groups. During the 220s CE Ardashir, the patriarch of the Sassanian dynasty, staged a successful revolt against the Parthians, leading to the Parthians' total defeat sometime between 223 and 227 CE. According to two Roman sources, the new dynasty, likely enraged by successive Parthian defeats at the hands of the Romans, announced their intention of recapturing the lands held by the former Achaemenid empire, which would have included Roman Syria, Palestine, Egypt, and Anatolia. Over the next four centuries the Romans and Sassanians would engage in a series of wars that were much more closely contested than the Parthian-Roman wars had been during the second century CE.

Alexander and the Hellenistic Kingdoms

Alexander the Great of Macedon (356–323 BCE) is known to posterity for his military genius and the vastness of his military conquests throughout the known world of antiquity. His campaigns fostered a new epoch in world history when Greek culture was infused into various world regions (such as Egypt, Persia, central Asia, and India). His successors (known as the *diadochi*) adopted his so-called cult of the ruler to augment their political control of their subject populations and continued Alexander's policy of Hellenizing the empire through the influx of Greek culture in the newly acquired dominions. In the aftermath of Alexander's death in 323 BCE, his generals Seleucus I, Ptolemy I, and Antigonus I, among other minor rulers, fought over and, in the process, divided the spoils of the overextended empire. In subsequent centuries,

the dynasties they established would contribute to the creation of the thriving Hellenistic world of the eastern Mediterranean.

The Seleucid empire, founded by Seleucus I (ca. 358–281 BCE), encompassed the provinces of Asia Minor, Babylonia, and Syria. At its greatest geographical zenith, it included vast tracts of central Eurasia from Thrace in the Greek peninsula to India along the Indus River valley. Of the three major successor kingdoms, Seleucus controlled the largest of the three but was constantly at war with the other Hellenistic kingdoms, losing provinces in the process. While Seleucus established his capital in the ancient city of Babylon in 312 BCE, he spent the duration of his life suppressing revolts by his satraps (Persian provincial governors). His attempt to adapt to the political arrangements of the former Persian empire (the satrapy) won him some successes with the local populations; however, his wars with the other Hellenistic kingdoms did not. However, under his reign and that of his successors, Seleucus was able to promote the expansion of Greek language and culture throughout his empire through Greek veterans' settlements, intermarriage, and commercial expansion.

Ptolemy I (ca. 367–285 BCE) was the founder of the Ptolemaic dynasty in Egypt, having served as a general for Alexander and having fought against Alexander's successors, establishing his dominion over the province of Egypt. Ptolemy managed to obtain Alexander's body in transit to Macedonia and proceeded to bury it in Egypt to legitimize his rule as successor of Alexander. Taking note of the Egyptian belief system regarding the afterlife and their king-deities, Ptolemy buried Alexander in an elaborate tomb in Alexandria. Ptolemy then proceeded to refer to himself as pharaoh, invoking the reverence of some of his Egyptian subjects. However, despite his efforts and that of his successors, most Egyptians did not accept Greek rule, and while some members of the ruling bureaucracy were Hellenized Egyptians, most of the administration was Greek in origin. Nonetheless, large-scale projects such as the Lighthouse and the Library at Alexandria (both later destroyed) were a testament to the efforts of the Ptolemaic dynasty at Hellenizing Egypt and the cultural exchange between Greek and Egyptian civilizations.

THE MUSEUM AT ALEXANDRIA

The Museum (*mouseion*) at Alexandria was an ancient Greek temple for the Muses, constructed specifically for the nine goddesses of music and literature but also as a ploy to solidify Greek hegemony in Egypt. The Hellenistic Egyptian ruler Ptolemy I founded the Alexandria Museum in the late third century BCE. The Museum served as more of a research institute than a temple for the Muses, and thus the pursuit of scientific investigations was central in the work of scholars there. The Museum developed as a center of Hellenistic science and drew visiting scholars throughout the Hellenistic world. Despite the Museum's gradual decline in the second century BCE, it survived well into the Roman period, serving as an example of the Greek intellectual tradition and as a conduit for cultural exchange between Greek and Egyptian civilizations.

—Abraham O. Mendoza

The Antigonid dynasty in Macedonia was founded by Antigonus I (ca. 382–301 BCE), a Macedonian general who served under Alexander. In the wars against Ptolemy and Seleucus, Antigonus succeeded in maintaining control over Macedon and most of the Greek peninsula. Utilizing the pretext of Macedonian unity over the Greek world, he succeeded in solidifying his control over Greece and continued support for his wars. Under his dominion and that of his successors, Greek life retained an element of cultural continuity from previous historical periods while shaped by contact with the Hellenistic kingdoms to the east and the emergent Roman republic to the west.

The Hellenistic successor kingdoms that replaced the massive empire of Alexander the Great lasted from approximately 323 to 30 BCE. Throughout this period, Greek culture, language, and values spread throughout much of the Mediterranean and the Middle East and, to a lesser degree, central Asia and India. Alexander the Great's conquests spurred Greek influence throughout the ancient world as it came into contact with older civilizations and empires, such as that of the Persians, Egyptians, Babylonians, Hebrews, and Indians. New Greek cities and settlements in colonial territory, initially founded by Alexander and then by his successors, further spread Greek commerce, religion, and values, becoming themselves centers of Greek culture. This led to an influx of ideas and a mixture of cultural influences, contributing to advances in architecture, sculpture, science, literature, and the arts. In turn, Hellenistic culture was influenced by central Asian and Indian traits, particularly in philosophy. While the Hellenistic Age ended in 30 BCE, finally succumbing to Roman hegemony, its influence continued to be felt for centuries.

Death of Alexander and Division of His Empire

The death of Alexander the Great in 323 BCE created a power vacuum in which his top generals clashed over the spoils of empire. Controversy over his death plagued the battle over succession, as various persons were accused of having conspired to poison Alexander. Commentators from antiquity until the present still debate the nature of Alexander's death as to whether or not he died from illness or extreme drunkenness or was assassinated by a potential usurper. As speculation over the nature of his death is further confounded by testimonies and accusations made at the time, the exact reason for his death at an early age is still an issue of contention. Regardless of the cause, his death created an untenable situation in which various contenders for power fought to legitimize their position as his proper successor. His death and the divisions among his generals over the future of the empire resulted in a series of wars and conflicts. Ultimately the major regions of Alexander's empire were passed on to three of his generals, with much of the rest achieving differing levels of autonomy or sovereignty.

Alexander the Great died in the city of Babylon on June 10, 323 BCE, after suffering from an illness, thought to be malaria, for approximately ten days. Almost immediately, rumors circulated that he had been poisoned by conspirators,

➤ ALEXANDER THE GREAT'S LEGACY IN ROME

While famous in his own time, Alexander the Great also remained a major historical figure throughout much of antiquity. Major figures in ancient Rome such as Pompey, Julius Caesar, and Augustus paid tribute to Alexander, admiring his greatness and imitating what they believed were aspects of his personality. Julius Caesar supposedly wept before a statue of Alexander in Spain. Allegedly, Pompey searched far and wide for Alexander's 260-year-old cloak and later wore it to ape Alexander's greatness. Augustus broke the nose of Alexander's sarcophagus in his enthusiasm while laying a wreath at his tomb in Alexandria.

—Abraham O. Mendoza

THE EMPIRE OF ALEXANDER THE GREAT

among them some of his top generals such as Antipater. However, it is also documented in some historical sources, such as the *Alexander Romance(s)*, that he might have possibly died from excessive drinking or a bout with a mysterious illness, thought by contemporary historians to have possibly been malaria. However, since such historical records are known to be questionable, given the mythical content attributed to Alexander's exploits their reliability is dubious at best. Moreover, recent studies about primary documentation from the period suggest that commentators were motivated by their own political loyalties to certain factions contending for power over Alexander's empire.

After Alexander's death, rule was passed on to Alexander's half brother Phillip Arridaeus and Alexander's son Alexander IV, who were put under the regency of Perdiccas and Cra-

terus, both Macedonian generals. Craterus was soon ousted from any real power, leaving Perdiccas as the sole regent and thus in control of the vast regions of Alexander's domain. However, in the process of consolidating his power, Perdiccas annihilated most of his opponents, murdering approximately 30 of them. At the Partition of Babylon in which the empire was designated to heir by compromise, Perdiccas named many of Alexander's former generals as satraps of the regions of the former empire. In 321 BCE Perdiccas was assassinated by his own troops during his war with Ptolemy, another one of Alexander's top generals. This led to the Partition of Triparadisos (321 BCE) in which Antipater was named as regent of the whole empire and also led to the satrapies again being redistributed among Alexander's former generals.

It was around this time that most of Alexander's top commanders were now bent on forming their own states, creating conflict with other potential successors. Antipater (397–319 BCE) and his family, primarily Cassander and Nicanor, were seen by many in Alexander's top circles to have perhaps been responsible for the alleged assassination. When Alexander's mother returned from exile to Macedon in 317 BCE, she had Nicanor killed for his alleged complicity in the murder of her son.

Nearly 20 years of fighting between rival monarchs plagued the Greek world following the death of Antipater in 319 BCE. All of the rivals claimed to be Alexander's alleged successor, as he did not designate one on his deathbed. After the Battle of Ipsus in Phrygia in 301 BCE, most of the major fighting ended as Alexander's empire was divided into four major states ruled by four of Alexander's top generals. Antipater's son Cassander ruled Macedon and some of the Greek city-states, Lysimachus controlled the province of Thrace, Seleucus I ruled the provinces of Mesopotamia and Persia, and Ptolemy I Soter ruled the Levant and Egypt. While Antigonus controlled Anatolia and Syria, he was eventually defeated by the other generals at Ipsus in 301 BCE, with his sons returning to Macedon. Finally, rule over Alexander's conquests in India passed to Chandragupta Maurya, who was also the first Maurya emperor. He was further able to expand his dominions after an agreement with Seleucus. Eventually, by 270 BCE, the three main kingdoms that were consolidated from the former territories of Alexander's empire were the Seleucid empire (Syria, Mesopotamia, and Persia), the Ptolemaic kingdom (the Levant and Egypt), and Antigonid Macedon (with some control over Greece).

Carthaginian Empire Structure

Control of the Phoenicians' vast trading-colony empire around the Mediterranean Sea was gradually transferred to their leading colony at Carthage in North Africa. While the ability of Phoenician cities in Lebanon to conduct independent trade became limited by powerful neighbors, Carthage was free to expand this empire, which stretched from the lands now known as Spain and Morocco all the way to Cyprus and Lebanon.

An excellent description of how the people of Carthage conducted their affairs was given to us by the philosopher Aristotle, who described a remarkably democratic system. He noted with surprise that even though the constitution of Carthage contained democratic features, it endured for a long time. Its citizens never mounted a rebellion worth mentioning and were never ruled by a tyrant.

➤ PEACE VERSUS WAR

According to Polybius, the government of Carthage faced a rebellion by its mercenary soldiers after the First Punic War. The soldiers had been retained but not completely paid because of the city's losses. This dependence upon mercenaries to augment its colonial troops was due to the Phoenicians originally being a very peaceful society with no military tradition. Even the founding of Carthage was described in Virgil's *Aeneid* as having arisen from a peaceful negotiation with local people. However, this tradition was broken when Carthage became the first Phoenician city ever known to raise an army and march off to a foreign war. This general lack of military experience was reflected in Carthage's poor results against the Greeks and Romans. Hannibal was the shining exception. But even Hannibal, with all his victories, never eliminated the weakened Rome. As a result, the Romans eventually fought back and were victorious against his troops.

—*Sanford Holst*

The magistrates of Carthage were elected based on merit rather than chosen by lot. Likewise, the kings of the city were not hereditary but instead were chosen from different families. Carthage also had a council of elders, which counterbalanced the judicial and executive branches of government. Even more surprising, the kings and elders of that time were required to submit major matters to a vote by the people, giving the community a direct say in the conduct of their affairs. In some respects, this system echoed a modern democratic government and may even have been more democratic than many are today.

The colonies of Carthage were believed to have been governed in the same loose manner as all Phoenician colonies. Their main obligation was to provide a share of their earnings as a donation to the male god of the parent city and to abide by the parent city's decisions on major issues. In keeping with this practice, Carthage was able to go into battle on Sicily in 480 BCE at the head of a vast army of 300,000 soldiers drawn from its colonies.

Carthage also continued to show deference toward its parent, the city of Tyre. In 332 BCE Carthaginian ships were reported to be on their way to Tyre with their annual share of earnings when that ancient city finally fell to Alexander the Great. After that time, Carthage continued to rule its large empire from North Africa until it perished at the end of the Punic Wars in 146 BCE.

Formation and Administration of the Roman Empire

After the destruction of the combined forces of Mark Anthony (82–30 BCE) and Cleopatra (96–30 BCE) at the Battle of Actium in 31 BCE, Octavian found himself master of the Roman world. In this tenuous situation, wishing to spare himself of the fate of his uncle Julius Caesar (100–44 BCE), Octavian assumed the office of emperor and declared the restoration of the Roman republic. This fictitious declaration veiled the fact that the Roman empire had replaced the Roman republic, taking the former institutions of the venerated republic and transforming them to suit the administrative needs of the far-flung dominions of the city of Rome. Under the ultimate leadership of the emperor, the Roman Senate, the patrician caste, and the military each occupied official positions responsible for the administrative duties of governance of the empire.

► CLIENT-KINGS AND ROME—KING HEROD

Roman administration of distant provinces rested on the ability to have available personnel on hand to carry out the day-to-day duties of governance. In some instances, Roman authorities allowed for local leaders, known as client-kings by contemporary scholars, to effectively administer for Rome, retaining some vestiges of autonomy. By installing, offering support to, and manipulating local friendly rulers, Roman authorities were able to rule vast tracts of territory throughout the Mediterranean world.

Perhaps the most famous (or infamous) of these client-kings is King Herod the Great of Judea (73–4 BCE) of biblical notoriety. In the midst

of the war between Parthia (Persia) and Rome over the provinces of the Levant, Herod allied himself with Rome and ultimately won the office of king with imperial support. Under Roman auspices, Herod stabilized Jewish civil unrest and attempted to Romanize the locals. Much like the Hellenistic kingdoms in their final days, Herod ruled only because he acquiesced to the demands of Rome, which is where his authority ultimately rested. Later in the first century CE, following Herod's death, growing Jewish civil unrest against Roman authority resulted in direct Roman rule.

—Abraham O. Mendoza

In order to prevent the association of his position with that of kingship reviled in Roman society since the days of the Etruscan Tarquin tyrants, Octavian instituted the office of emperor, which gave him an inordinate amount of duties and responsibilities that he would delegate to others in the Senate. In this way, he was able to create the impression of the preservation of the Roman republic. The establishment of the Principate between 33 and 27 BCE, which this new governmental structure is commonly known as, facilitated the transition from the chaos of the late republic into the stability of the empire.

The office of emperor gave Octavian (known as Augustus, or “Revered One,” after 27 BCE) a great deal of authority over the destinies of the empire. He also acquired multiple titles and office that conferred on him the ultimate leadership of the Roman empire while maintaining the trappings of the republic. The office of imperator gave him full authority over the Roman legions. The title of princeps acknowledged his position as first citizen and first among equals with members of the Roman Senate. He shared proconsular power with the Senate, giving him governing authority of various provinces and direct command of the legions in them. He also had greater proconsular power, which gave him authority over all other governors in the provinces that he did not directly control. Tribunician power granted him the authority of the tribune, giving him the right to call assemblies, the right of veto power, and the right to appeal to citizens. Consular power granted Augustus the power to call the Senate and chair meetings and also gave him vast legal and administrative powers. Upon taking all these offices, Augustus effectively replaced what had previously been delegated to single magistrates under the republic.

Under Augustus, the old institutions of the republic continued to function, albeit in a subordinate capacity to his office, in the administration of the day-to-day existence of the Roman empire. The Senate remained the governing council of the republic and was composed of senators generally hailing from elite Roman families. They served the emperor as governors and generals of armies in the provinces. Offices within the Senate continued to exist although with different roles to be fulfilled. Consuls con-

Roman emperor Caesar Augustus rose from near obscurity to become the most powerful man Rome had ever seen. He ushered in an era of stability and prosperity, exercising shrewd and subtle control over the government, enacting popular reforms, and harnessing the symbolism of Rome's history. (Library of Congress)

tinued to preside over the Senate and over all government business. Subordinate to them were praetors, who functioned as legal officials who could aspire to be governors in the provinces. Tribunes continued to represent the interests of the plebian classes. Aediles were officials in charge of the city of Rome. Most of these offices came with much prestige and privilege in the days of the republic, but in the new political arrangement created under the principate, they were related to the role of administrative tasks and ceremonial roles to preserve the illusion of the existence of the republic. In essence, most of the powers formerly bestowed on the Senate had now been assumed by the emperor.

Rule over the Roman provinces rested directly with the emperor and with governors appointed by the Senate. Imperial provinces were ruled by legates, typically former consuls or praetors appointed directly by the emperor.

THE ROMAN REPUBLIC AT THE DEATH OF TRAJAN IN 117

Provinces under the rule of the Senate were under the supreme authority of the governor. The governor was responsible as chief financial, judicial, and military leader of the province along with his staff. Taxes were collected by freedmen (former slaves) accountable to the authority of the governor. Depending on the size of the military garrison of the province, the governor could conduct much of his administrative duties with the assistance of the military. When this option was not available, the governor had only limited manpower available to carry out the duties of running the province. The legates administering the imperial provinces were in the same situation.

The provinces, while under the authority of the Roman emperor and Senate, retained various degrees of autonomy. This situation rested on the ability of the local Roman magistrate to rule effectively given his resources. If he lacked the support of the Roman legions or enough subalterns, the governor or legate would have to increas-

ingly rely on local cities, townships, and communities to govern themselves. Local elites and town councils in various provinces were held accountable for the day-to-day administration of their affairs to the governor. Their autonomy was granted due to lack of resources and not typically for any other reason. Governors and legates would typically visit cities on formal occasions to oversee how governmental duties were being carried out and to collect taxes. However, the ability to enact effective governance differed from province to province and was contingent on the resources available to governors.

In later centuries the administration of the Roman empire increasingly relied on the cooperation of provincial elites in managing their own affairs. By granting universal citizenship in 212 CE to the entire Roman empire and in effect giving Roman citizens agency in the offices of government in Rome, there was an expansive development in the inclusion of non-Italians in

the running of the empire. In the late Roman empire, reforms in administration included dividing the empire into two parts (West and East) and including greater numbers of non-Romans, such as Germanic settlers, into administrative roles.

Aśoka and the Formation of an Indian Empire

King Aśoka is perhaps the most well-regarded ruler of ancient India. He is the first Indian whose life dates are known with relative accuracy (272/268–ca. 231 BCE), he was one among the few Pan-Indian rulers ruling over the major part of the subcontinent, and by issuing edicts on rocks and stone pillars, he was also the first Indian king to employ writing on a larger scale. In fact, the Brahmi script he used for the edicts (and from which all Indian alphabets derive) may have been created during his time. Finally, Aśoka had an important afterlife as an exemplary ruler.

Under Aśoka's grandfather Chandragupta, the Maurya dynasty emerged successfully from the struggle among the competing Vedic city-states in the Ganges plains. In his conquests, Chandragupta extended the Mauryan empire from its heartland around the capital Pataliputra (modern Patna) to northwestern India. This expansion brought the Mauryas in contact with various non-Indian cultures such as the Greeks and the Achaemenids (Persians). After a short regency under Chandragupta's son during which the new kingdom threatened to fall apart again, Aśoka came to the throne in 272 BCE. At first he reconquered the regions subdued by his grandfather before he was formally crowned in 268 BCE. Not content with the conquests already made, Aśoka expanded his kingdom farther to-

ward southern and southwestern India and finally to the regions along India's east coast. This last campaign against the Kalingans proved to be a bloody one, as thousands of people were killed, abducted, or driven from their villages. Full of remorse, the king changed his style of governance, replacing conquest by force with conquest by *dhamma*.

The term "dhamma" may have several meanings in India. To Hindus, it is linked to the duties of caste, while Buddhists take it to mean their religion at large. Aśoka freed the term from these religious connotations and used it in a more general sense: For him, dhamma meant to live in accordance with cosmic laws, to lead a life of morality and good behavior. Moreover, the king embarked upon a program of public welfare, which included the digging of wells and the establishment of hospitals and the like. Even though this dhamma propagated by the king was by and large nonsectarian in outlook, there was a certain anti-Brahmanic sting in Aśoka's edicts. In Vedic society, Brahmins held a distinct status as masters of religious ceremonies, which Gautama Buddha, Mahavir (the founder of Jainism), and other religious dissenters had rejected. Aśoka sanctioned their efforts to reform Brahmanism by proscribing sacrifices particularly of animals, which formed an important part in Hindu ritual.

In fact, Aśoka's conquest by dhamma appears to have come along with the king's personal conversion to Buddhism. He visited several sites of India associated with the career of Gautama Buddha such as Bodhgaya (the place of enlightenment), Lumbini (birthplace), and Sarnath (first sermon). As Aśoka stated, he had adhered to Buddhism rather loosely for some time before becoming a zealous follower. Though technically remaining a layman, the king increasingly meddled with the internal affairs of the Buddhist monks' order (*sangha*), for instance warning monks not to cause a split of the sangha by quarreling over texts and interpretations. In this context, the king was invited to and presided over the Third Buddhist Council, which allegedly resulted in the standardization of the Buddhist scriptures and the expulsion of dissident monks from the sangha.

➤ AŚ OKA'S ROCK EDICTS

In his edicts, which represent the oldest dated writings from ancient India, King Aśoka advocated morality among his subjects. The third major rock edict states:

“King Piyadasi, Beloved-of-the-Gods, speaks thus: This has been ordered twelve years after I became king. Everywhere in my domain, [officers such as] Yuktas, Rajjukas and Pradeshikas shall go on inspection tours every five years for the purpose of moral instruction. It is good to respect mother and father, relatives, Brahmins and ascetics, it is good to abstain from killing living beings, it is good to be moderate in spending and saving” (translation by author).

—*Tilman Frasch*

Source

Ulrich Schneider, *Ashoka* (Die grossen Felsedikte, Wiesbaden: Harrassowitz, 1978).

Very broadly, three groups of edicts can be distinguished. In the first group are the minor rock edicts (MREs), which were concentrated in the region on the border between the modern Indian states of Karnataka and Tamil Nadu. The MREs were written in the third regnal year and contain in a nutshell what the major rock edicts (REs) would later on repeat. The REs were written after a brief interval in the twelfth–thirteenth regnal years that mark the time of the Kalingan War. They are distributed all over the Indian subcontinent from present-day Afghanistan and northwestern Pakistan (Shahbazgarhi, Mansehra) to the Upper Yamuna River (Kalsi) and Orissa (Dhauili and Jaugada) through to South India (Eragudi, Sannati) and the Indian west coast (Sopara, Girnar). Both their distribution and linguistic peculiarities suggest that they were meant to outline the border of Aśoka's empire.

The last set of inscriptions, written mainly on pillars, was commissioned by the king toward the end of his reign. The pillar inscriptions are remarkable in that the sandstone on which

they are incised comes from two quarries close to the Ganges River, from where they had to be transported to the sites with considerable effort. Likewise, the pillars are normally crowned with animal-shaped capitals representing lions, bulls, horses, and elephants. The four lions from the Sarnath pillar have been selected as modern India's coat of arms. In addition to the pillar inscriptions, a few more inscriptions record donations to religious ascetics (e.g., at the Barabar caves) and regulate Buddhist monastic life, as mentioned above.

Aśoka's empire appears to have consisted of five parts. The core area around the capital Pataliputra was surrounded by four provinces, arranged very roughly according to the points of the compass and each standing under a capital city of her own. These were Ujjain in the west, Taxila in the north, and Jaugada in the east. No capital has been identified in the south so far, but the concentration of MREs suggests where it may have been. While the king governed the core area himself, the provinces were ruled by vice-roys. Moreover, a number of other administrative officers are mentioned in the inscriptions. These include Rajjukas, Yuktas, Pradeshikas, spies, and most notably special officers to look after morality (*dhammamamahamattas*). Given that these special officers for the dhamma had to be familiar with general principles of morality and be prepared to travel (i.e., walk) over huge distances, it seems possible that the king recruited them from among the Buddhist monkhood.

The last reference we have for the king is the pillar inscription from his twenty-ninth regnal year. If the calculation is based on his proper coronation in 268 BCE, the inscription was written in 239 BCE. This last edict is somewhat different in tone, especially in strengthening the powers of the judicial officers (Rajjukas). Possibly the king began to realize that he could not improve the behavior of his subjects without sanctions threatening those who continued to misbehave. The king was coming of age by that time and may have felt his life's achievement failing. Indeed, when Aśoka passed away after an alleged reign of 37 years, the empire quickly dissolved, and Brahmanism revived in the form of horse sacrifices and royal support for Hindu temples.

However, Aśoka was kept in high esteem by Buddhists, who saw him as an exemplary Buddhist ruler. This process first culminated in Sri Lanka in the fourth–fifth centuries CE, when the Buddhist chronicles *Dipavamsa* and *Mahavamsa* were written. In these works, Aśoka is credited with convening and presiding over the Third Buddhist Council, which resulted in the purification of both the Buddhist scriptures and the sangha. Later Buddhist kings would invariably refer to this council when attempting to exert a similar measure of royal patronage and control. Moreover, Aśoka sent out Buddhist missionaries to countries outside the subcontinent, most notably the Near East, Southeast Asia, and Sri Lanka. It was Aśoka's own son Mahinda who brought the Buddha's teachings to this latter place, while the king's daughter founded the order of nuns on the island. In the eyes of the Lankan chroniclers, Aśoka was thus not only instrumental in making Sri Lanka the home of Buddhist orthodoxy (Theravada), he was also

the disseminator, patron, and purifier of the religion.

■ Introduction: Politics and Art

Some of the greatest art of the ancient world was created as a celebration of political life. The colossal Olmec heads of Mesoamerica likely represent important political personages (although the possibility that they depict athletic heroes cannot be ruled out), and certainly much early Maya art celebrates the ruler directly. The palaces and statuary of Mesopotamia celebrate the achievements of ancient kings, and the temple walls of Egypt are filled with accounts of the exploits of the pharaohs. The architecture of the Athenian acropolis not only serves a political function but also celebrates democratic achievements. Roman imperial statuary, some of the greatest sculptural portraits ever created, was designed to glorify the leaders of public life. The following entries explore some of the different ways in which art and politics intersected from 1000 BCE to 300 CE.

—Kevin M. McGeough

Images of Kushite Kingship and Queenship

Kushite kings and queens were depicted in a manner closely resembling an Egyptian ruler in their roles as political leader, priest, and military commander. These images were meant to illustrate the power of the king and queen.

As political leaders, the rulers of Kush are distinguished from the rest of the population by their clothing and their headdresses. The Napatan kings wore clothing, jewelry, and various crowns similar to that of the Egyptian pharaoh, but they often preferred wearing a very distinctive Nubian crown. This crown—never seen on an Egyptian pharaoh—is referred to as the Kushite skullcap. It is a close-fitting cap with two uraei (rearing cobras) on the brow. Two ribbons are also attached at the back of the cap and reach past the shoulders.

Pylon of the Apedemak Temple at Naga depicts King Natakamani (left) and Queen Amanitore smiting their enemies. (Caroline M. Rocheleau)

Although the Meroitic kings and queens also wore this skullcap, their royal costume differed even more. Among the different clothes, we note a fitted white tunic, a red-colored sash with tassels, and a cloak. Queens wore long form-fitting dresses that revealed ample curves and pleated shawls. Meroitic jewelry was also distinctive, and the royal family is often shown wearing large earrings, necklaces with large round beads, or chokers, pendants, and rings decorated with rams representing the god Amani (the name of Amun in the Meroitic language).

The Kushite king, just like the pharaoh, was also a priest and a religious leader. Temple reliefs show the Kushite king and queen, and occasionally the crown prince, worshipping various deities. The royal family is depicted in full royal regalia, standing one behind the other, facing the deity. Often they hold what has been interpreted as clappers in their hands as they raise their arms, palms outward, to greet a god or a goddess. By offering in the temple, the king ensured that the gods bestowed upon Kush all that was good and beautiful for its population. This was a symbol of the king's power, his ability to take care of his people and his land.

The king's military prowess and his might were depicted for all to see on the pylons of funerary chapels and temples. The ruler's power is evident in the so-called smiting scene, which de-

picts the Kushite king with an arm swung backward, ready to smite the enemies held tightly by the hair with the other hand. This scene, however, is the typical depiction of the Egyptian king's power. From the time of Narmer (ca. 3000 BCE), the Egyptian king demonstrates his might by smiting his enemies. The Nubians were famed for their archery skills, and rulers might be shown holding a bow and arrows as well as a sword in a scabbard or a spear.

Meroitic queens were also shown wielding weapons and smiting enemies, and it should not be surprising that history records powerful women as military leaders and rulers in Nubia. Several queens held the title of *qore* (commander) together with that of *kandake*, indicating they were considered the actual ruler of the Kingdom of Kush.

Hellenistic and Roman Ruler Portraits

The portraiture of Alexander the Great broke with tradition by rejecting the beard of his father, Philip II of Macedon. Instead, Alexander opted for a clean-shaven appearance, luxurious curly hair, and an inspired glance. The Hellenistic kings who succeeded Alexander then adopted many of these features for their own portraits. A number of coins and a handful of extant Hellenistic royal portraits testify to the fact that it became common for the portraits of royal men to depict these rulers as clean-shaven, curly-haired, and generally youthful looking.

Hellenistic kings were, however, perfectly capable of selecting only certain features from Alexander's portraits. Some wore beards, for example, or commissioned portraits that alluded to their more advanced age. They also adapted

ruler iconography from outside the Greek repertoire, as in Egypt, where the dynasty founded by Alexander's general, Ptolemy I, employed sculptural types (the sphinx) and attributes (the *nemes* and uraeus) that had long been used by the pharaohs.

Roman exposure to Greek culture in the late republic led to the occasional importation of elements from the Alexander type into the Roman repertoire. We see such elements, for example, in the portraiture of Pompey the Great. In the first century BCE, this strand of ruler iconography existed alongside an indigenous Roman trend known today as verism. At first glance, veristic portraiture can seem to be simply a sort of hyperrealism: the sitters appear with all of their defects, wrinkles, moles, bald patches, and the like. Consideration of the entire corpus, however, reveals that outside of funerary contexts, these portraits are almost always of men, and many were likely of high status. Veristic portraiture did not just show how they really looked but transmitted the message that at a time of ongoing civil war (the first century BCE) these leaders were hardened, that they both acknowledged the difficult situation and had the wisdom and cleverness to survive.

When the Roman republic collapsed after a century of civil war, the first emperor of Rome, Augustus (27 BC–14 CE), rejected veristic portraiture in favor of youthful depictions. He came to power at a young age, but these youthful portraits continued to be employed until (and after) he died in his seventies. The portraits of Roman emperors continued to be clean-shaven until the reign of the emperor Hadrian (117–138 CE), who adopted a beard and set an example for male portraits during the remainder of the second century.

During the republic, women and children had sometimes been represented in funerary art, but they rarely appeared in contexts that reflected high social status. The trend toward including women and children in the iconography of power likely began with the profamily policies of Augustus and can already be seen on the Altar of Peace in Rome, but this trend also reflected the increased influence of anybody who was close to the emperor.

Near Eastern State-Sponsored Art and Architecture

First-millennium BCE state-sponsored art and architecture had their roots in earlier traditions: the tripartite temple with antechamber, main chamber, and inner sanctum; the palace centered on the throne room, with flanking courtyards from which opened public and residential rooms; carved stones recording royal deeds; and the use of precious materials in palace and temple construction. Though the Neo-Assyrians still honored their gods, particularly Assur, frequently represented by a winged sun-disk, their architecture and accompanying art laid more emphasis upon their own power and irresistibility: massive city walls with great towers, vast palaces, huge winged bulls and lions guarding entrances and gateways, and graphic reliefs decorating the palace walls, reinforcing the message that the Assyrian king was universally victorious in battle, on the hunting field, and against the forces of nature. Guardian figures

and reliefs were also part of contemporary state architecture in the Levant, but the subject matter ranged more widely, with little emphasis on dominance. It was in this region that several architectural developments occurred. A feature of earlier palaces, the *bit hilani*, now reached its mature form: a pillared portico leading into a throne room or major reception hall. In some, the portico columns were sculptured human figures, while others had wooden shafts, set on a column base of one or a pair of animals such as lion or sphinx and topped by a capital. Such pillars found their fullest flowering later in the great pillared halls of the Persians. The Persians, often employing Near Eastern craftsmen, also adopted the Mesopotamian traditions of massive guardian figures and reliefs, the latter combining Greek naturalism, Babylonian-inspired royal figures, and images of ethnic diversity to create a new message of universal power and beneficial peace. The crowning glory of Babylonian architectural decoration was the use of colored glazed bricks to create magnificent friezes of bulls, dragons, and lions; this the Persians also adopted, for example to depict royal soldiers in the palace at Susa.

Polis-Based Public Art

As with any ancient society, state patronage was one of the most significant sources for the creation of art and architecture. The state unit of ancient Greece was the polis, or city-state. Poleis used art as a way to compete for prestige and to promote state propaganda. Throughout their history, poleis had three main governmental systems: oligarchy, tyranny, and democracy.

Many of the most important sanctuaries of Greece were established during the eighth and seventh centuries BCE as part of the development of the poleis. Poleis were governed by a ruling elite class of citizens or oligarchy. Sanctuaries, such as that of Apollo at Thermon, included wooden temples with terra-cotta roof tiles, very costly constructions at that time.

These efforts were community projects and were the focal points of public festivals that were expressions of civic identity.

During the sixth century BCE civic competition intensified with ever grander building projects. The increase in scale of interpolis competition was due in part to the fact that many city-states were ruled by dictators with popular support. These dictators, called tyrants, used public building and artistic programs to advertise their might. Stone temples were planned and constructed in most major Greek sanctuaries in the sixth century BCE. Some of the most lavish examples, such as the colossal temple of Hera at Samos, were the showpieces of tyrants.

The Athenian democracy of the fifth century BCE was one of the greatest sources of artistic patronage. In the city center, or agora, was the Painted Stoa, a building displaying paintings of the Athenian victory at the Battle of Marathon. Also in the agora was the sculpture of the Tyrant Slayers, statues of the two Athenian citizens whose actions had led to the foundation of the democracy. The grand building plan on the Athenian Acropolis, with its spectacular temples the Parthenon, the Uruktheion, and Athena Nike, were all extremely elaborate celebrations of Athens' part in the Greek victory over the Persians in 479 BCE. The architectural program of the Acropolis promoted the superiority of the city and its democratic ideals yet was built using the tribute from the Delian League, Athens' de facto empire. With this source of wealth, Athens was able to afford structures that strove for perfection and spared no expense. The temples and the monumental gateway on the Acropolis were made entirely of high-quality marble. Temples traditionally were built of limestone, while fine details were completed in marble. Dozens of optical refinements were included in the building architecture. These refinements were not necessary for structure but required a great degree of extra work merely to improve the harmony of the buildings' appearance. The sculptures on the Acropolis buildings were more numerous and elaborate than had ever been seen on Greek temples. The Parthenon in particular bore sculpture in every space allowable in its Doric order and even included the addition of a sculpted frieze, which usually only occurred on buildings

THE PARTHENON METOPES

The four sides of the Parthenon contain sculptured panels. Each one represents one mythological story. The four stories were unified by a theme of civilization over barbarism. On the east side of the building was depicted the battle of the Olympian gods against their divine predecessors, the Giants. The gods had won this battle and the right to rule the universe. On the north side was shown the Trojan War, a tale of a unified Greece defeating a powerful kingdom of the east. On the west side were panels of the Greeks fighting the semianimal centaurs. The south side showed a battle between the Greeks and the Amazons. Amazons were legendary women warriors from the edge of the world who represented a reversal of the natural order.

The Development of an Imperial Art Associated with the Palaces of the Assyrians and Persians

When Cyrus II (550–522) founded the Achaemenid empire (sixth to fourth centuries BCE), the Persians were a relatively new ethnic group in Iran, speaking an Indo-European rather than a Semitic tongue. Unlike their Mesopotamian neighbors, they had little familiarity with monumental

art and architecture and enlisted the skills of foreign craftsmen to create their imperial palaces. The result was a unique international style that incorporated motifs from across the empire, including Egypt, Greece, Elam, Babylonia, and Assyria. The influence of Greek artistry is readily apparent in Achaemenid art, but most of the imperial themes were selected and reformulated from Assyrian prototypes, revealing two distinct cultural philosophies and two forms of imperial identity making in the ancient world.

The Neo-Assyrian empire (ninth to seventh centuries BCE) had long vanished when the Achaemenids became the new rulers of the ancient Near East, yet they left an indelible legacy of imperial art. The Assyrian palaces at Nimrud and Nineveh were decorated with monumental wall panels carved in relief, an innovation of Ashurnasirpal II (885–859). The reliefs narrated the king's duties and achievements, which included ritual ceremonies, tribute processions, hunting expeditions, building projects, and, most famously, battle campaigns that revealed the details of the assault and the enemy's ignominious fate. The Assyrians valued accurate portrayals of events, and the narratives provide

Assyrian assault on an Egyptian town as depicted on a relief from the wall of the North Palace of Ashurbanipal, Nineveh. (Erich Lessing/Art Resource, NY)

information about ancient architecture, landscapes, clothing, and military technology.

Assyrian palace art was as vigorous and dynamic as its kings, designed to evoke fear and awe in the viewer. The Achaemenids emulated the majesty of the wall reliefs but in an abbreviated, figural style that conveyed a sense of universal harmony and stability. The remains of Achaemenid palace art can be found at Susa, the old Elamite capital, and at Pasargadae and Persepolis in the Persian heartland. Persepolis, the celebrated capital of Darius I (521–486), is the best preserved of the Achaemenid sites and exhibited the mature art of the Persians. The visual program revolved around royal themes lifted from Assyrian narratives: the king was shown walking with palace attendants, sitting enthroned, and receiving an audience and as a royal hero, battling fierce animals. The various cultures of the empire, distinguished by dress and accoutrements, were prominently featured as gift-bearing delegations in a ceremonial procession and as individuals supporting the weight of the royal throne. In Assyria and most ancient Near Eastern traditions, the conquered were shown humbled or prostrate before the king, but at Persepolis they stood upright, led by the hand into the royal presence. We are given the impression of a political encomium, where the delegates were eager to greet their sovereign.

The art of Persepolis was more persuasive than coercive; the realities of imperial conquest, such as warfare, forced submission, and the extraction of material resources, were not displayed. Instead, conquered peoples were portrayed as willing participants in a cooperative state, one based on the kind of moral rulership that was embodied, according to Herodotus, by

Cyrus II. By cleverly manipulating known idioms of imperial power, the Achaemenids propagated an idyllic state of unity in diversity and a new imperial model in the ancient world.

Greek Art and Culture in Hellenistic Administration

Upon the death of Alexander the Great in 323 BCE, his empire stretched from Greece to India. His generals divided up his empire, creating the Hellenistic kingdoms. These Greek rulers reigned over numerous and diverse cultures. The Hellenistic monarchs were foreign to most of their subjects. They faced the problems of how to unify their subjects and how to convince the considerable populations to follow them as rulers of these vast states.

To achieve both of these ends, Hellenistic kings promoted their own culture as a common one to be shared by everyone, particularly the upper classes, throughout their empires. Greek art was a way in which this cultural koine, or commonness, was promoted and communicated throughout the Hellenistic world.

Secular architectural projects helped to spread the Greek cultural institutions for which they were used, such as gymnasia (schools of philosophy and physical education) and theaters. Temples and altars to Greek gods were constructed to promote Greek religion, such as the temple of Pythian Apollo at Daphnae near Antioch, Syria, and the numerous temples to Greek divinities in Oxyrhynchus, Egypt.

Stone and bronze sculpture was one of the most favored art forms in Greece. Greek sculptures of gods or heroes or even vanquished ene-

► THE PERGAMON ALTAR

The Attalids were a Greek dynasty that ruled over the kingdom of Pergamon on the coast of present-day Turkey. A gigantic altar to Zeus, the Greek king of the gods, was built in a prominent place in the capital city of Pergamon. This altar was set atop a podium decorated with a relief sculpture of the battle between the Greek gods and the giants. This story was one that paralleled the story of the Greek rulers conquering numerous lands to create their kingdoms. It was rendered in impressive high-relief sculpture with the figures well over life size, making it a powerful and impressive work. At the top of the altar were sculptures telling the story of Telephos, mythical founder of Pergamon who was the son of Herakles, the Greek hero. This story connected Pergamon to Greece and served to link this nation of diverse people to its Greek ruler.

—Angela Murock Hussein

Great Altar of Zeus from Pergamon (180–160 BCE), as displayed at the Pergamon Museum in Berlin. (Luis Villa del Campo)

mies showed their subjects as physically fit, beautiful, and often nude. These statues could be used to promote Greek ideals such as athleticism. These images gave people models to strive for, particularly in cultures of the Near East where it was considered inappropriate to be nude in public. Compositions that recounted myths or portrayed gods not only promoted Greek religion and literature but also could be selected to convey political messages. Portraits of rulers were sculpted realistically but semi-idealized. These helped to familiarize the populace with the rulers and also to promote a heroic image of the monarchs.

Urban Planning in the Roman Empire

Rome's victory in the three Punic Wars against Carthage (264–146 BCE) led to the acquisition of vast overseas territories in the western Mediterranean, including Sicily, North Africa, and southern Spain. Later, western Asia Minor, Greece, and the Balkans including Macedonia were conquered. The rapid expansion of Rome's domain—once limited to the central Italian peninsula—created a huge overseas empire that required defense and administration. Rome had gone from a small city-state to an empire in the span of 200 years, roughly between 150 BCE and 50 CE. Two of the major issues confronting the victorious Romans were how to settle the thousands of Roman war veterans, many of whom were poor and landless, and how to convey through administration the culture and power of Rome to the conquered peoples in some 30 provinces with dozens of languages. To deal with the challenge of rule, ensuing Roman armies and the administrators operated within these newly conquered lands with a mixture of force, coercion, and

THE LEGACY OF ROMAN URBAN PLANNING

One of the great legacies of Roman civilization was the systematic use of the grid pattern in urban planning. Fifteen hundred years after the Romans started the process, the Spanish empire modeled its overseas colonies on the same Roman grid. Many cities in the Americas today still bear this imprint and are testimony to ancient Roman urban planning. They include Buenos Aires, Argentina, Lima, Peru, Havana, Cuba, and many others. To a lesser extent, American cities established in the nineteenth century such as Chicago follow this same pattern of well-organized streets and civic structures with a central town square. The ancient Roman empire is long gone, but its genius for urban planning is still alive in many cities of Europe and the New World.

—Anton Rajer

propaganda, identifiable in the urban planning throughout the empire.

Roman urban planning had two sources of inspiration: Roman military forts and the planned Greek cities of Magna Graecia (greater Greece) such as Naples in southern Italy and Syracuse in Sicily. Both systems employed rectangular grid patterns with streets running perpendicular to each other. Civic buildings were in the center of the grid and included forums, temples, basilicas, and theaters. During the expansion of Roman territory into what had been Magna Graecia, the Romans encountered Greek cities with orderly straight streets and forums surrounded by government and religious structures. The Greek cities, such as Priene in Asia Minor, followed the Hippodamian urban plan, which is based on the grid pattern. It is ironic that the Roman genius for urban planning never was expressed in the empire's own capital city. Rome remained a maze of narrow streets and alleys.

The Roman military camp layout served as a model for permanent Roman colonies, especially on the empire's frontier. During military campaigns the Roman Army established camps based on the square with orderly rows of legionnaire tents. At the head of the camp would be the commander's headquarters. The entire campsite, or *Castra Romana*, would be surrounded by an

earthen wall and a provisional wooden barricade patrolled by sentries. Some of these camps became semipermanent enclaves and later evolved into towns such as Turin and London.

Combined with the pragmatic Roman approach to hygiene—including public latrines, fountains, and aqueducts for water—Roman engineers created a template for establishing and building Roman colonies virtually anywhere within the empire, with certain modifications to adapt to local climate and ecology. In time, these colonies served to spread Roman culture and the Latin language over a huge area. Numerous modern European cities, such as Arles in France, Valencia in Spain, and Trier in Germany, still bear the imprint of the ancient Roman camps and towns that preceded them. In addition, abandoned Roman cities, such as Leptis Magna in Libya and Timgad in Tunisia, remain as archaeological relics in North Africa.

Roman urban planning was quite different in the eastern Mediterranean, where Rome encountered ancient cities and well-established cultures such as those in Egypt, Greece, and Judea. Nonetheless, in places such as Antiochia in Syria, Roman engineers imposed their standard grid pattern and added forums, basilica, public baths, temples, aqueducts, theaters, and stadiums. On occasion in the older cities of the East, Rome was content to modify the urban fabric with the necessary structures of their rule, superimposing aqueducts and baths on these ancient towns.

Latin culture, law, language, and social values accompanied the systematic founding of Roman towns and colonies throughout the empire, which stretched eventually from the north of Britain to the Sahara Desert and from the Euphrates River to Portugal. Today, 30 different nations comprise what once was the Roman empire. Roman cities that sprang up along trade routes included Paris, London, Avignon, Cologne, and Tarragona. Despite continued political feuding in Rome that led to sporadic civil war, the program of settling veterans and promoting Roman culture went on. Beginning with the rule of Emperor Augustus Caesar, the empire's administration was based at the Tabularium building in Rome on the Capitoline Hill.

Using Hellenistic Greek architectural models for temples and covered markets, trade and com-

merce flourished between the colonies, which were linked to each other and Rome by a vast network of roads and sea routes. These paved roads began in 312 BCE with the Via Appia, which was built by Appius Claudius. They eventually included more than 70,000 miles (112,000 kilometers) of all-weather roads that stretched across plains, mountains, and deserts and spanned hundreds of rivers with bridges made of stone, some of which are still in use today. On a paved Roman road, it is estimated that a legion of 1,000 men could march 20 miles (32 kilometers) per day fully loaded with gear. At this pace, it would have taken about 21 days to go from Rome to the empire's northern frontier at Trier, Germany.

The typical sequence for establishing a Roman *urbis* or *colonia* included several steps. Skilled survey teams would complete the *centuriatus*, or plotted survey of the land. All conquered lands underwent some form of survey, which facilitated a basis for taxation and gifting of land to veterans or public sale. Survey teams would identify the most promising location for a colony and then plot a grid pattern for the principal buildings: temples, law courts, baths, and theaters. The *urbis* would be built in stages as money permitted and need required. For example, in western Mauretania (present-day Morocco and Algeria), Emperor Augustus established 12 colonies for 40,000 retired soldiers and their families. As the empire grew more prosperous, so did colonial desires to imitate the monumental art and architecture of the type found in Rome. Each colony vied for the construction of grand civic structures that indicated loyalty to Rome and its social values.

The Emergence of Buddhist Art in Association with Aśoka's Reforms

Aśoka inherited the throne of the Maurya empire from his father, Bindusara, in 272 BCE. A little more than a decade into his reign, Aśoka converted to Buddhism. Most of our knowledge of Aśoka comes from Buddhist chronicles and his own words, carved into rock edicts that he had erected in locations throughout his vast empire.

According to these sources, after the final battle that resulted in the consolidation and expansion of his empire to its greatest height, Aśoka felt remorse for the bloodshed he had caused. This was the point at which he apparently became very serious about his practice of Buddhism, which began to exert a profound influence on his policies. He sought to reform ancient Indian society in order to bring it more into line with dharma. This is a term used frequently in Aśoka's edicts. It does not seem to suggest an exclusive adherence to Buddhism but rather to the Buddhist ideals of truth, nonviolence, and compassion.

Prior to Aśoka's conversion, Buddhism was only one of the many religious sects with followings in ancient India. There was, of course, Brahmanism (the tradition that would eventually become Hinduism) but also the various *śramaṇa* traditions, such as Buddhism, Jainism, and other now-extinct groups, such as the Ajivikas.

With Aśoka's conversion, Buddhist art first became apparent as a distinctive artistic tradition in India. Aśoka, following the pattern of earlier rulers, showed his support for religious groups by providing them with material support: monastic institutions, temples, and clothing, food, and writing materials for monks. Aśoka was not exclusive in his support for Buddhism, providing other groups, such as the Ajivikas, with monasteries as well. But Buddhism did receive his special patronage, which was a significant impetus for the creation of Buddhist art.

The most ancient forms of Buddhist art are the stupas, or burial mounds, holding relics of the Buddha and of various early Buddhist saints. The most famous such mound, the great stupa at Sanchi, in central India, dates from the Aśokan period.

Early Buddhist art, interestingly, does not depict the Buddha's physical, human form. It instead simultaneously represents both his presence and absence from the world by means of abstract imagery. The stupa itself is such an image. By containing the relics of the Buddha, it conveys the fact that the Buddha was once physically present in the world but has since left for the realm of nirvana.

Other Buddhist monuments associated with Aśoka are the pillars and rock edicts that he had erected at pilgrimage sites connected with important events in the life of the Buddha. Particularly important sites commemorated by Aśoka include Lumbini, where the Buddha was born; Bodhgaya, where he attained nirvana; the Deer Park at Sarnath, in which he preached his first sermon after attaining nirvana; and Kushinagari, where he left his body, entering the state of *parinirvana*.

Images of Filial Piety in China

Filial piety, generally speaking, is a kind of virtue that children display in their treatment of their parents. Zengsen, Confucius's student and grandson, defines filial piety as a virtue including three layers of meanings. The primal filial piety is to pay respect to one's parents, obey them always, and honor them by virtues and achievements throughout one's life; the next is not to shame one's parents, which denotes that one must protect him or herself from any harm, have dignity in society, and not hesitate to take revenge for one's parents when they are humiliated by others; the third is that one must support

the parents when they are old, take care of them when they are sick, and offer them respectful funerals when they are dead. All these ideas are expressed in the *Classic of Filial Piety*, allegedly a collection of Confucius's didactic teaching on filial piety compiled at the beginning of the Warring States period (fifth to third centuries BCE).

China has a long tradition of portraying ancient virtuous, sage figures and their stories on walls, screens, and other materials in order to admonish later generations to follow their moral deeds and teachings. The images of filial piety show themselves as successors of the age-old tradition on the one hand and convey some new social information on the other. The filial figures vary from legendary kings to common people, and their ages range from five to the seventies, but no matter who and how old they were, they were all portrayed as children in style, which denotes the definite moral example calling for others, no matter how old, to follow. For instance, in the portrait of Laolaizi, Laolaizi had to pretend to be dressed and behaving in the manner of a child in order to entertain his parents, even though he was in his seventies. On the other hand, Xiang Tuo, a five-year-old boy distinguished for his enormous Confucian knowledge and wisdom, was portrayed as a gentleman discussing questions with Confucius and Laozi.

The popularization of images of filial piety in Han China also indicated a certain social trend that Han people adopted and promoted. From the Western Han dynasty, filial piety became part of the governmental ideology on which a certain governmental recruitment system was built. Those who had remarkable reputations for being filial and uncorrupt were recommended by local government to the court on a regular basis. As a result, those who were considered filial sons and daughters won not only fame and respect from within the family but also concrete gains from outside, such as the rewards of money, tax exemptions, and official appointments. Such an ideal pattern of extending the management of family affairs to that of the state affairs nevertheless produced a counterreaction once people focused mainly on realistic benefits instead of the essence of real filial piety. In that case they would exaggerate their grief and so-

lemnity by offering lavish funerary rituals and monuments in order to show to the public how filial they were. As a matter of fact, it was very fashionable during the Eastern Han dynasty to decorate family shrines with the images and stories of famous filial figures, which seemed to indicate that at least they were following the good examples. The expression of individual grief became a kind of public performance.

Maya Images of Power

Maya elite used images of power to help maintain their esteemed positions in society. Their images of power included costumes, fine furnishings, imposing architecture, and decorated monuments known as stelae. Power, as discussed here, is the ability to command respect or fear in others. In the stratified society of Early Classic Maya, rulership was inherited along the patriline. Each new ruler acquired the position but still needed to prove that he was capable of rule.

One way of maintaining respect in the polity was by ostentatious displays of wealth. The outfits that high nobility, especially kings, wore showed that they were different than commoners. Rare gems adorned their bodies, and exotic plumage was embroidered into their head-dresses. Furthermore, their clothing bore the signs of supernatural entities, which the rulers were believed to embody and control. (The culmination of these traditions can be seen in the monuments of later kings, such as at Yaxchilan and Tikal and in the Bonampak murals.)

Portable wealth was not the only way to emphasize power. Architecture could also be a permanent sign of power, especially when coupled with religious symbolism. The temples

➤ DEPICTIONS OF THE MAIZE GOD

The San Bartolo murals depict sacred scenes of ritualized power. The murals were recently discovered by William Saturno and are still under investigation. They were painted on the interior of a small building that was later incorporated into a large pyramid. The walls contain narratives of early Classic beliefs concerning man's creation and the role of the Maize God. Symbolically, the Maize God was a metaphor for resurrection and rebirth. Kings were ritually dressed as the Maize God and often impersonated him during festivals. In this way, kings were potentially tied to a principal deity and incorporated his essence into themselves.

—Zachary Nelson

of the Maya were constructed by nonelites under the direction of elites. These multitier imposing edifices were often dedicated with human sacrifices and precious materials placed in the interior. The exterior of the buildings also ritualistically embodied images of power. Early architectural masks—such as at Nakbe, Guatemala; Tikal, Guatemala; Cerros, Belize; and Copan, Honduras—were impressive feats of architecture in their own right, but they were considered parts of a living entity (the building) by the Maya. Architectural masks showed aspects of gods, supernatural beings, and the organized cosmos. The buildings themselves were charged with supernatural forces and generated power for the rulers through their creation and use. An overlooked aspect of placing different kinds of images on different levels of the structure is that the composite image changes depending on the visitor's perspective. It may resemble a hill or witz-monster from afar, then shift into a water-monster as one approaches the steps. These shifting essences were purposely constructed into the building to enhance its power in the eyes of the beholder.

Architecture was not the only permanent display of power. Most rulers in ancient Maya civilization are known solely through stelae. A stele (singular) is a carved monument, often rectangular, set vertically in front of pyramids and significant structures. These monuments

were decorated with images of rulership. Often incised, stelae record the exploits of the king. A typical stele shows the king receiving tribute from foreign lords on its front. On the back is an image of the king celebrating the new year's arrival. On either side of the stele appears text. The text begins with the date that the stele celebrates. Frequently, this is a katun ending, or a 20-year cycle. Next, the text mentions the ruler's birth, his parentage, and his accession to the throne. Following this is his bibliography, written in terms of battles won, wrongs avenged, and an occasional pious reference to the gods. Stelae are permanent images of powerful rulers, eternally crowned.

Olmec Heads

The Olmec civilization of ancient Mesoamerica is arguably most famous for its colossal sculptures of human heads. It is unclear who is supposed to be depicted on these heads, which were carved in the Early Formative period (ca. 1200–800 BCE). All of the portraits are of young men, and each presents an individual face. No two heads are alike. Given the size and other physical characteristics of these sculptures, it is likely that they reflect important members of the community, be they political leaders, economic leaders, deities, athletes, or others who made notable contributions to the community. Regardless of whom these were meant to represent, it

is likely that they reflect the use of art for political reasons in ancient Mesoamerica.

Each of the heads has been carved from a single piece of volcanic basalt. Although some seem to have been carved with much more skill than others, most display a high degree of skill in stone sculpture. These heads are quite heavy, and it would have taken considerable effort to drag the large basalt boulders from the quarry to the cities in which the heads were found. Very likely, the boulders were floated downriver for much of the distance.

So far, 17 heads have been discovered in total of varying size and workmanship. The largest are around 9 feet (3 meters) tall. All of the heads wear some sort of headgear, which scholars often assume is the protective headgear of a ball player. Every piece of headgear is different, and some scholars have suggested that the different iconography may reflect symbols for different peoples or groups. The treatment of the ears in the sculptures varies. Some ears are covered by the headgear. Other ears have representations of spools, made by inserting large polished stones into a hole in the lobe.

In their present state, most of the heads are covered in intentional pockmarks. Some have suggested that these pockmarks reflect a ritual of desanctification, when the head was taken out of ritual use by the community. Other scholars have suggested that these pockmarks reflect purposeful vandalism. If the sculptures do represent ancient rulers, perhaps they were vandalized by people from other communities or by opposing individuals from within the community. In later times, some of the sculptures were broken up to be reused in the manufacture of other stone artifacts.

Part of the difficulty in interpreting these colossal heads comes from their unclear context, as few if any have been found in what would appear to be their original location of display. At the site of San Lorenzo, for example, a number of the heads had been buried in antiquity. The site of La Venta may shed some light on their original use, as one head was found at the base of a pyramid. Perhaps this reflects the original setting for these heads.

—Kevin M. McGeough

➤ ALTARS AT LA VENTA

Seven sculptures that have come to be known as “altars” have been recovered from the site of La Venta. These “altars” are rectangular structures that are about 6.5 feet (2 meters) high by about 13 feet (4 meters) wide. Each looks like an altar or table in that the top is a large flat surface, slightly longer than the base of the object. Each “altar” bears a carving on one side. The carving on Altar 4 is perhaps the most famous. It features an individual seated in what appears to be a cave.

The figure holds a rope that runs all the way around the base of the “altar.” Altar 5 has a similar image, but instead of a rope the seated figure holds a “were-jaguar baby,” a figure that was thought to be able to change between human and jaguar form. Despite the fact that scholars call these sculptures “altars,” most believe that they were thrones for Olmec leaders to sit upon during important events.

Possible Moche Ruler-Portraits

The Moche civilization (ca. 0–800 CE) emerged on Peru's north coast, in or near the region's river valleys from the Piura to the Huarmey, as Chavín influence receded. We do not know what the Moche called themselves; they left no written records. Archaeologist Max Uhle named the entire civilization after the Moche River, where he discovered pyramid complexes in 1899 CE. The Moche, like their predecessors and successors, inherited and built upon earlier Pan-Andean political, economic, and cultural traditions to serve their own ends.

Specific Moche contributions and innovations include the approximately 900 portraits we currently find among the more than 160,000 photographs in the Moche Archive at the University of California, Los Angeles. These portraits appear on stirrup-spout ceramic vessels shaped as three-dimensional human heads. They

mostly depict adult males in fine nuanced detail. Scholars remain interested in the following questions: Why did the Moche produce these portraits? How did they produce and distribute them? What did they mean to those who received, viewed, and used them?

The circumstances surrounding scholars' discovering these portraits have tended to obstruct their answering of the above questions. Scholars found some of them in what appear to be high officials' burial sites. They found none of them in rulers' burial sites such as those at Sipan, for example. And most portraits surfaced only after looters removed them and then sold them to private collectors. Data on these portraits' provenance, then, remains scarce and at best inconclusive.

This notwithstanding, the available evidence tells us much. The Moche produced these particular portraits for approximately 100 years, roughly from 400 to 500 CE. Before and after this period, their artistic and other cultural artifacts primarily reflect their concern with the supernatural. For a time, then, Moche elites supported artists concerned with realistic, natural expression and representation. When they produced these portraits, the Moche used sophisticated molds and related technology. They likely produced several copies of each portrait and perhaps at different locations as well. The portraits themselves seem to represent individual historical human beings, sometimes at

different moments in their lives. They clearly show human emotion and even, in some cases, idiosyncratic characteristics and deformities, such as harelips.

Archaeologist Christopher Donnan speculates that during this 100-year period in Moche history wealthy political leaders and other secular elites supported craftsmen who in turn produced and distributed their portraits. These elites directed these portraits' distribution to lesser elites and officials who apparently used them as vessels in their everyday lives, although at least some of them took the portraits with them to their graves. This, then, tended to affirm and maintain regional and local political alliances and trade agreements. If this is correct, then we might view these portraits as somewhat analogous in purpose, meaning, and use to U.S. presidents' autographed photographs that appear in political contributors' and high bureaucratic officials' offices at the federal, state, and local level in America today.

However this may be, following this brief period the Moche suddenly stopped producing these portraits. They then reverted to their earlier preoccupation with the supernatural. Thus, Donnan further speculates that the Moche embraced a revivalist movement after 500 CE, and this coincides with the Moche's subsequent decline.

The Mounds of the American West

Debate has raged since the days of Ephraim Squire and Edwin Davis concerning America's moundbuilders. Squire and Davis were commissioned in the 1840s by the American Ethnological Society to examine and analyze the mounds found in the Ohio Valley. They subsequently published in 1848, under the auspices of the re-

cently established Smithsonian Institution, *Ancient Monuments of the Mississippi Valley*. They argued that the mounds could not have been constructed by Indians. Rather, they contended that these earthworks had been result of the labor of defensive experts who had been descended upon by hostile Indians. Previously, in 1840, historian George Bancroft stated that the mounds were a natural phenomenon. Samuel Haven thereupon weighed in on the controversy by stating that the mounds were indeed the product of indigenous Americans, as they paralleled what was being unearthed and discovered in Europe, Mesopotamia, and Mesoamerica by archaeologists.

Near the modern-day city of St. Louis are the remains of the largest earthwork system in the U.S. Midwest. Other sites are located in the expanse of the region extending both eastward and southward along the Mississippi River. They possess certain common elements: they are located near or on the shores of rivers and their tributaries. Cahokia, because of its location at the juncture of the Missouri, Illinois, and Mississippi rivers, offers a glimpse into the mounds found in the Midwest and elsewhere. Before the decline of Cahokia there is evidence that it was a vibrant port for trade. The central part of the community flourished from about 700 to 1300 CE. Excavations beginning in 1924 and lasting into the 1960s revealed that its existence was not happenstance. Because Cahokia housed and supported a population of maybe 10,000, it was almost certainly a major civil center for the region. Scholars believe that this is true for all or most of the mounds found in North America. They had been constructed and designed to mark territory. Though Cahokia was not a traditional city from a European point of view, it provided goods to and received products from the many farming settlements surrounding it. It is also clear that Monk's Mount was the focal point of the city. Scholars can decipher the day-to-day lives of its inhabitants from the available evidence. It is likely that there men were building and repairing structures within the settlement as well as hauling in wood or maybe water to supply its dwellings on a quotidian basis. Moreover, perhaps there would be women carrying

baskets of fish and other produce as a normal daily routine. It is clear from the evidence from Cahokia and other mound cities that careful planning took place and that they were intended as permanent settlements. They were important centers where people assembled for social, economic, and ceremonial purposes.

Economics and Trade

According to tradition, the Silk Roads that connected China to Rome was established when the Chinese official Zhang Qian was dispatched by the Han emperor Wudi to establish a military alliance with the Yuezhi, a steppe people who had migrated west. Zhang Qian was unsuccessful in that enterprise, but he brought back to China word of far-off lands: Anxi (Parthian Persia) and Tiaozi (Parthian Mesopotamia). In response to overtures from Emperor Wudi, envoys from Anxi visited the Han court and brought with them “conjurers” (perhaps acrobats) from Lijian, which is thought to be the Levant, the eastern Mediterranean region of the Roman empire. Archaeological investigations have called into serious question this account of the foundations of this system of trade caravan routes, suggesting that it may have been established centuries before the Han dynasty. Despite the fact that the term “the Silk Road” has become a popular phrase, it was not a single road but a series of many different parallel and intersecting routes that connected China with India, central Asia, Southwest Asia, the Mediterranean, Southeast Asia, and various other locales. Most merchants and travelers, if any, did not travel the entirety of the Silk Roads during this period. Rather, people traveled along set stages of the various routes, and goods were passed down the line. Moreover, Chinese silk was only one of many luxury goods traded along these routes. For the Chinese, it was the exotic goods that came from central Asia and farther away that were of primary interest. People, technology, flora, and fauna were also transferred; viticulture traveled east, and Chinese artistic designs were adapted throughout central Asia in part through this trade network. Of particular importance to the Han court were the large and powerful horses imported from central Asia, horses that were far larger than those indigenous to China.

The Silk Roads were not the only major trade route that connected disparate regions of the world during the period 1000 BCE to 300 CE. The Phoenicians, who moved from the Lebanese coast to settle in North Africa during this period, created trade networks throughout the Mediterranean, with themselves as the major merchants and shippers. Under Roman rule, the entire Mediterranean became an extended trade network. Roman efforts to reduce piracy and the construction of port and shipping infrastructure greatly facilitated the economic connections between North Africa, western Asia, and Europe. An overland route connected the Red Sea with the Mediterranean Sea and thus connected India with Mediterranean ports. The so-called Incense Route, or South Arabian trade network, brought spices from Yemen to the Mediterranean. Much of Europe was connected by an extensive system of roads

and riverine traffic that allowed for relatively easy and safe transportation within the Roman realm. Across the Bay of Bengal, traders could travel from Tamil India to coastal Southeast Asia. Water routes along the coast of Southeast Asia further let travelers voyage to China.

In the Americas, new trade routes developed in a number of regions. In what archaeologists call the Middle Woodland period (1–500 CE), much of the eastern United States was joined together in an extensive trade network. The evidence for this extensive trade network is the large amount of exotic goods (goods that could not have been manufactured or gathered locally) found throughout eastern U.S. archaeological sites at this time. In the Great Lakes region of the United States, copper was heavily traded. Extensive trade networks are also evident in Peru at this time, where the coasts, mountains, and jungles were connected through the exchange of goods.

The period from 1000 BCE to 300 CE also sees a dramatic change in agricultural economics. It is in this period that the first industrial-scale agriculture is established. This is a dramatic transformation in human subsistence practices and today is the dominant mode of food production and distribution in North America and Europe. In ancient times, industrial agriculture was usually associated with larger empires and often with slave labor, as was the case with Roman *latifundia*. Agriculture on this large a scale would be encouraged in the outer areas of the empire as a means of providing for urban populations. The Neo-Assyrian empire, with its center in Mesopotamia, established industrial-scale agriculture and production on the Philistine coast after conquering this region. Recent excavations at the city of Tel Mique-Ekron have shown that the Neo-Assyrians encouraged the cultivation of olives there and the subsequent production of olive oil, which was then transported back to the Assyrian heartland. A similar situation is apparent at the site of Ashkelon; in this case though, grapes and grape products (such as wine) were the primary commodities. In Roman times, the population of Rome grew to such an extent that the surrounding agricultural regions could not supply enough food for the population. Given the difficulties of overland transportation, wheat was not typically imported to Rome from other parts of Italy. Rather, it was shipped to the city directly from North Africa, and especially Egypt, after these regions fell under the authority of the Roman empire.

Despite the appearance of industrial agriculture, small-scale farming remains the most common type of subsistence practice in much of the world at this time. In Roman culture the family farms remained an idealized form of production, and Roman public figures would claim to be descendants of family farmers as a means of gaining public support. Given the difficulties in transporting and storing large quantities of agricultural products, industrial-scale agriculture remained limited to regions with sizable populations and stable transportation infrastructure. Typically it involved foodstuffs that take longer to spoil, such as olive oil and wine products.

Arguably the most significant innovation in economics and trade that arose in the period from 1000 BCE to 300 CE was coinage. Coinage and money have become such essential components of everyday eco-

conomic life that people rarely consider its importance. Coinage greatly facilitates the exchange of goods; it allows exchange to occur in situations where only the buyer has to have something that the seller wants. Thus, buying and selling become much easier, and the storage of wealth is greatly eased since one does not have to worry about that wealth spoiling. The first coins appear in Anatolia, and this system was quickly adopted by the Greek city-states.

As coinage became a more established method of facilitating exchange, stores and markets became more important locations for the exchange of goods. Rather than accepting goods in kind, storekeepers could now accept money in exchange for products and services. This particular kind of exchange system became very common in the Greek and Roman worlds. People living in Rome had access to a number of different malls, structures that housed a number of different stores. The largest of these malls was Trajan's Market in Rome, which opened in 114 CE and held over 150 shops.

■ Introduction: The Development of Industrial-Scale Agriculture

Between 1000 BCE and 300 CE one of the most profound changes in the history of agriculture occurred: the widespread development of industrial agriculture. This was a new type of agriculture, farming at a large scale well beyond what the local producer (and the local producer's tax-collector) could consume. It is frequently associated with the growth of large empires; conquered territories were compelled to produce agricultural goods for the dominant power. Although hints of industrial-scale agriculture appear in earlier times, it is in this period that it begins to have wide-reaching effects. Since this type of agriculture involved growing large amounts of crops, it usually required that those crops be converted into some kind of secondary resource (such as olive oil or wine), which would not spoil over the time it took to transport these crops long distances. In some instances, these crops were clearly grown and sold for profit. In other instances, these crops were produced for distribution throughout an empire. In either situation, this new scale of agricultural production allowed people to grow crops that were most suited for their local cli-

mate and at the same time to gain access to crops from more distant locations. It also reduced the self-sufficiency of local farmers and compelled them to be integrated into a larger network of economic interest.

Industrial Olive Oil and Wine Production in Philistia

During the Iron II period (ca. 1000–586 BCE), industrial-scale agricultural production emerged in coastal Philistia (located in the modern nation of Israel). These Philistine cities were often governed by external powers and throughout this period developed economic strategies to produce large amounts of specialized surplus goods to be used as trade items for goods produced in other centers. In some situations, this surplus production seems to have been organized by external (imperial) authorities; in other cases, surpluses were produced in tandem with other mercantile groups in the region.

➤ WHAT DID AN OLIVE OIL FACTORY LOOK LIKE AT TEL MIQNE-EKRON?

The olive oil installations at Tel Miqne-Ekron were concentrated in one particular zone of the city, a zone that the excavators refer to as the industrial zone. Each factory consisted of three rooms. One of these rooms in each factory contained an olive oil press and other stone equipment, such as basins and weights, that were used to crush olives and allow oil to be extracted. The finest oil was made first. Olives were crushed in a basin with a roller, and the oil was extracted. The remnants of these olives were then put into a circular press; pressure was applied by adding stone weights to a large wooden lever. The other two rooms in the factories were used for a variety of other oil-production activities, such as storage of manufactured goods.

—Kevin M. McGeough

Recent excavations at the site of Tel Miqne-Ekron in Israel have provided important information about the development of industrial-scale agricultural production within an imperial context. Tel Miqne-Ekron was a Philistine city that was incorporated into the Neo-Assyrian empire during the Iron II period (Tel Miqne is the modern name of the site, and Ekron was its ancient name). The conquest and incorporation of this city into the Neo-Assyrian empire led to a reorganization of the city's economic infrastructure and production activities, according to the excavators of the site.

The Neo-Assyrian empire was a massive empire centered in Assyria, the northern portion of Mesopotamia (in modern-day Iraq). During the reigns of Tiglath-Pileser III (r. 744–727) and Sargon II (r. 721–705), Assyria expanded its territorial control beyond its traditional western boundary of the Euphrates River and began integrating foreign territory directly into its imperial framework. Assyrian treatment of these new territories varied substantially. In some cases, these lands became provinces within the Assyrian government. In other cases, these territories became vassal states where local rulers were required to pay substantial tribute to Assyria and

remain loyal to the empire, although they were allowed to govern themselves to some extent. As is well documented in regard to the kingdom of Israel, the Assyrians were not reluctant to dramatically alter the makeup of these incorporated territories; much of the population of Israel was deported and resettled in the eighth century, although it is debated how many individuals were actually removed.

Assyrian intervention in local affairs extended beyond the political and social. Economic activities within the conquered lands were reorganized to better serve the needs of the Neo-Assyrian empire. This is most evident at the city of Tel Miqne-Ekron, which was dramatically reorganized in the eighth century so as to provide Assyria with olive oil both for its own use and as a relatively nonperishable commodity that could be traded for other goods.

Excavations at Tel Miqne-Ekron, led by Trude Dothan and Seymour Gitin, have revealed much about the Assyrian restructuring of the economic basis of the site. Ekron, prior to the seventh century, was a relatively small city, and there is no evidence that there was any olive oil manufacturing at the site. Numerous nearby cities, however, had small olive oil installations. These sites were destroyed by the Assyrians, and it is quite likely that the inhabitants of these cities were moved to other parts of the Assyrian empire. The city of Ekron was expanded during this time and developed into a center of specialized olive oil production. The excavators calculate, based on the quantity of olive oil production facilities found, that Ekron, after its integration into the Neo-Assyrian empire, would have been able to produce around 290,000 gallons of olive oil annually, which is roughly 20 percent of what is produced and exported in modern Israel. This amount is well beyond what would have been needed locally; no doubt the olive oil that was produced at Ekron was redistributed throughout the Neo-Assyrian empire and was sold to other polities in the eastern Mediterranean.

Textiles were also produced at Tel Miqne-Ekron. The excavators believe that textile production was also engaged in at an industrial scale, although the evidence for the amounts of textiles produced is more difficult to interpret. Tools for textile production were found within the olive oil

workshops. The excavators suggest that since olive oil production could only have taken place during a few months of the year, given the agricultural cycle of olive farming, the inhabitants of Ekron would produce textiles in the off season. These textiles may have been produced not only for the Ekronites' own consumption but for consumption throughout the Neo-Assyrian empire and for trade with other locales.

The archaeological evidence from Ekron and its environs is indicative of the type of economic restructuring that may have gone on in other parts of the Neo-Assyrian empire, the concentration of what had once been small cottage industries into larger industrial-scale production centers.

Evidence from other neighboring sites has shown that industrial-scale agricultural production was not just an Assyrian phenomenon at the time. The Leon Levy Expedition to Ashkelon led by Lawrence Stager of Harvard University has demonstrated that this coastal Philistine city was a large-scale wine production center. There, excavators uncovered a building that measured 4,305 square feet (400 square meters) that they refer to as a "royal winery." This building was capable of producing massive amounts of wine that was traded with other cities and regions (although there is little direct evidence of trade with Assyria). Two Phoenician shipwrecks off the coast of Ashkelon each held 400 large wine amphorae, wine that had been purchased at Ashkelon and that the Phoenicians intended to trade in other parts of the eastern Mediterranean. Similar finds from the Philistine city of Ashdod suggest that it was also a thriving industrial-scale wine production center.

Slave Labor in Roman Agriculture

Although there are no reliable statistics, it has been estimated that there were approximately two million slaves in Italy at the end of the first century BCE. According to Strabo, the slave market on Delos would sell tens of thousands of slaves in a single day. The main supply of slaves came as prisoners of war from Rome's wars of expansion in the second and third centuries BCE.

This influx of slaves provided the labor force for slave-run plantations, or *latifundia*. Latifundia originated at the end of the second century BCE and were owned by members of the Roman upper class. The use of slave labor together with the concentration of land and money enabled the owners to specialize in the bulk production of cash crops such as olive oil and wine. The villa at Settefinestre near Cosa in Tuscany is a fine example. Owned by the family of Lucius Sestius, the consul of 23 BCE, the complex includes the building (the *villa urbana*) that housed wine and olive oil processing and the farm (the *villa rustica*) that contained granaries and storage facilities. The wine was shipped to central and southern France in amphorae that were likewise produced on the estate.

Shipwrecks carrying cargoes of Italian wine and olive oil have been found throughout the Mediterranean from the end of the second century BCE and offer evidence of how the slave-based large-scale agriculture led to the production of market-based commodities such as wine. The *La Grand Congloué B* sank off the coast of Marseilles between 110 and 80 BCE. The cargo consisted of 1,200-1,500 wine amphorae that were manufactured in the vicinity of Cosa, most of

▶ SPARTACUS' REVOLT

Three major slave revolts threatened Rome in the first and second centuries BCE. The first two took place in Sicily in 135–132 BCE and 104–100 BCE. The slaves, led by Eunus and Kleon in the first war and Salvius and Athenion in the second, sought to establish an independent kingdom.

The third and most famous revolt broke out among gladiators in the Campanian town of Capua in 73 BCE. Led by a Thracian gladiator, Spartacus, the slaves were able to defeat the Roman forces sent against them and ravaged southern Italy. At the height of the revolt, Spartacus was said to have commanded as many as 120,000 slaves and was able to defeat both the consuls of 72 BCE (L. Gellius Publicola and Cn. Cornelius Lentulus Clodianus) as well as the governor of Cisalpine Gaul. The slaves were finally routed in Lucania in 71 BCE by forces under the command of the praetor M. Licinius Crassus. Spartacus was killed in the battle, and the survivors were crucified.

—Benedict Lowe

them on the estate of Sestius at Settefinestre. The volume of wine production at the expense of cereal cultivation prompted the emperor Domitian (r. 81–96 CE) to ban the planting of more vines in Italy and to order the destruction of half of the vineyards in the provinces.

Large-Scale Cotton Production in India

Cotton production and the spinning of high-quality textiles are ancient economic activities in India dating back to the Harappan, or Indus

Valley, civilization, which was at its technological height from 2600 to 1900 BCE. Complex textile impressions have been discovered on a variety of items from this civilization, suggesting widespread use of cotton cloth. Archaeological evidence suggests that the Harappans used spindle whorls for spinning and wove cloth of both cotton and wool. The spinning wheel would not be introduced in South Asia until many centuries later, by Muslim weavers.

Indian cotton production may also have developed independently in the eastern part of India. This is suggested by the fact that linguists have traced Indo-Aryan terms related to the use of cotton to the Munda language group, which is spoken primarily by tribal peoples in eastern India. But given the fact that scholars also do not yet know what language the Harappans spoke, it is possible that these terms came from the Harappans (if the Harappans spoke a Munda or Munda-related language, as some have suggested).

In whatever part of the subcontinent it was first developed, cotton production was gradually disseminated throughout India, being particularly prominent in the centrally located Deccan plateau and western India, the black soil of both regions being conducive to cotton growth. Threads made of cotton silk have been found in the western state of Maharashtra dating to 1000 BCE and earlier. These fine threads indicate a high level of expertise in cloth manufacture.

By the fifth century BCE cotton production was common throughout South Asia. Farmers in northern India produced cotton as well as rice, barley, and lentils at this time, all of which would continue to be staples of Indian agriculture for centuries.

During the Mauryan period, cotton—in both raw and woven form—was a common item of trade, both internally to India and for export abroad. Although cotton production was associated primarily with the western and central regions, the *Artha Shastra*, a text of political theory attributed to Chandragupta Maurya's mentor, Kautilya, claims that the cotton of Madurai, in today's state of Tamil Nadu in the southernmost part of India, is of particularly high quality.

Fine Indian textiles were highly popular export items, attracting Greek, Roman, Arab, and later European merchants. Megasthenes, the

Greek ambassador to the court of Chandragupta Maurya, described cotton production on such a vast scale that his accounts were widely regarded in Europe as exaggerations. And Herodotus, in his *Histories*, also describes the Indian warriors in the armies of the Persian emperor Xerxes as having been dressed in cotton. Even the Greek word for fine cloth, *sindom*, is derived from Sindh, a region of India in which cotton was produced from a very early period. Clearly, cotton production was widely associated with India in the ancient world.

Oasis Agriculture in Central Asia

The arid climate of central Asia was not always conducive to productive agriculture. While the Neolithic Revolution (8000–4000 BCE) and the spread of agriculture blossomed in the regions of Egypt, Mesopotamia, and China, central Asia took another route. Indeed, the first known agriculturalists in central Asia do not appear until between 7000 and 6000 BCE, 2,000 years after agriculture appeared in Mesopotamia. Some scholars believe that farming only spread in central Asia because of a slightly warmer and wetter climate that occurred in central Asia from circa 6000 to 2500 BCE.

However, with the invention of the *karez* irrigation system, agriculture became more widespread throughout central Asia. Although the oasis provided water, without the *karez* form of irrigation, accessing sufficient water for personal use and agricultural use would have been impossible. Even with this and the resulting agricultural production, the oases could not support larger populations.

While the oasis towns of central Asia were better known for being trading centers along the ancient Silk Roads, travelers also noted the quality of the fruits and vegetables of the region, es-

HAN MILITARY-AGRICULTURAL COLONIES IN XINJIANG

As the Han dynasty (206 BCE–220 CE) expanded westward toward central Asia, its leaders discovered that imposing their will over central Asia was impossible. The nomads could easily cut their lines of supplies and communication. Logistical difficulties were compounded, as much of the route was through the Taklamakan Desert in modern Xinjiang Autonomous Region of the People's Republic of China. While a large Han army could impose a brief period of Chinese domination over the region, the local population's recognition of Han authority was fleeting.

Beginning in 100 BCE, the Han began a systematic effort to exert their influence westward. To do this they established garrisons in marginal lands. However, the cost to feed them was enormous; therefore, it was expected that the garrisons become self-sufficient. *Karez* irrigation systems provided water and gradually increased the productivity of the soldiers' farming. While they provided security, the garrisons also were a boon to trade, as they became another stop on the Silk Roads between central Asia and China.

—Timothy May

pecially the melons. Farmers also grew other crops such as wheat, barley, chickpeas, and grapes. While the oases could be self-sufficient and even produce surpluses for trade, most of the intensive agriculture of central Asia was based in the Zarafshan and Fergana valleys.

Sedentary agriculturalists and pastoral nomads are typically viewed as diametrical opposites with a long history of animosity. However, in most regions there was a symbiotic relationship. For farmers of the oasis, the nomads were not only potential customers for crops that could not be grown in the steppes but were also a source of animals for farm labor. As the nomads possessed numerous animals in their herds and flocks, a ready surplus existed for trade purposes. Thus, the trade between agriculturists and nomads was not uncommon.

In addition to the animals, primarily horses, gained from the nomads, central Asian agriculturists also domesticated goats and cattle during

the Bronze Age (3000–1000 BCE). Onagers, or wild asses, were also domesticated and used as beasts of burden or as draft animals. Indeed, during the Bronze Age cattle and donkeys were used with the plow by oasis cultures throughout central Asia.

Expansion and Development of Silkworm Cultivation in China

The first use of silk is unknown, but dyed silk gauzes dating from 3600 BCE have been excavated in China. However, even by that date sericulture had a long history there. Until the Warring States period (475–221 BCE), China was the only country in the world that practiced silkworm breeding, silk reeling, and silk weaving, and by that time it had achieved a high level of technical competence. A great variety of fabrics were produced, including brocades that required draw looms, gauzes, crepes, taffetas, and leno (cross-woven fabric).

Very early Chinese silk was made from wild moths. The cocoons were collected when the moths emerged, but enzymes used by the moth to break free of the cocoon damaged the silk, preventing it from being removed in one long strand. This meant that the shorter filaments of silk had to be spun together to make thread, and the result was a less lustrous fabric more like modern raw silk. Eventually the moth *Bombyx mori* was domesticated and became the main source of silk filament. Around the year 1000 BCE silkworm production was formalized, and silkworms were brought inside the house for rearing. Women were placed in charge of the labor-intensive task of rearing the silkworms. Silkworms had to be fed fresh mulberry leaves several times a day and kept warm, dry, and clean. After about five weeks they were transferred to racks, where they wove their cocoons. Before they could break out of their cocoons and the sericin that bound the silk fibers together could harden, the fiber from several cocoons was soaked in water and then reeled together to form a thread. This meant that the fibers had to be reeled within a few days of their completion. Special ceremonies were held to encourage the people to reel as quickly as possible, and even the empress showed the importance of the task by reeling silk. By the Han dynasty (206 BCE–220 CE) a new method of storing the cocoons in salt killed the pupae and allowed the reeling process to continue over a longer period of time. It was not until the Tang dynasty (618–907 CE) that the current method of boiling and then drying the cocoons to allow longer storage before spinning became common practice.

China's silk industry began in the middle reaches of the Yangtze Delta, and that region remained the center of production until the Warring States period. Gradually, sericulture spread to the lower reaches of the Yangtze. The states of Qi and Lu were especially well known for their silk production. Groups began to specialize in spinning or weaving, which improved the end product. It became an unwritten law in China that all unmarried young women, even those of noble families, had to learn to reel and weave silk. In an attempt to further improve the quality of production, the Chinese government began to regulate spinning

STANDARDIZING SILK

During the Zhou dynasty (1050–221 BCE) the Chinese government codified the standard length and width of a bolt of silk. Fabrics not meeting the criteria could not be sold. *The Book of Institutions of the Zhou Dynasty* set the width at 2.2 *chi* and the length at 40 *chi*, or about 30.3 feet (9.24 meters). This was not a random choice. It represented the amount of cloth needed to produce a court dress for an average-sized man. This bolt size remained standard through the Han dynasty and is mentioned in the Han fictional work *The Book of the Prince of Huainan*.

—Rebecca Wendelken

and weaving workshops in the Zhou dynasty (1050–221 BCE).

As sericulture grew, new tools and processes were developed. Metal tools were easier to keep clean, and other special devices, including shallow trays that set in frames, decreased the amount of disease among the silkworms. By the Han dynasty the tools needed to breed silkworms were highly developed and changed very little over the next millennium.

Development of Cacao Production in Central America

Pre-Hispanic Mesoamericans prized their chocolate drinks. Chocolate was an unsweetened drink composed of ground cacao, chili peppers, and various fruit nectars served frothed in enormous highly decorated mugs. In Mesoamerica, chocolate beverages were served to important guests. This custom was similar to the elaborate tea ceremonies of Japan or the fine wine service of the French. The mugs were straight-walled vessels with highly decorated exteriors. Along the top of the mug were calligraphic inscriptions that identified it as the drinking vessel for chocolate-fruity drinks. It is difficult to know when cacao was first harvested, but cacao residues have been found in early contexts, the most notable one from Rio Azul dating to 460 CE. The ancient Maya called it *kakaw*, while Aztecs called their beverage *chocolatl*.

Cacao trees (*Theobroma cacao*) grow best in warm, wet areas. Cultivated groves of cacao were found along both coasts of Central America in antiquity, climate permitting. Wild cacao trees are still found from southern Mexico to Brazil and Ecuador. Cacao trees thrive in shade and at low densities. In dry areas, they were carefully tended in sinkholes.

> CACAO BEANS AS MONEY

Fresh cacao pod and dried cacao beans.
(iStockPhoto)

Money did grow on trees. Cacao beans were used as barter in the ancient cultures of Central America. Gonzalo Fernández de Oviedo y Valdés wrote in 1535 that dried cacao seeds, which he called *almendras*, were precious like gold. A slave could be bought for 100 dried seeds, a rabbit could be bought for 10 seeds, and a prostitute could be procured for 8–10 seeds. Anything that could be bought or sold had an equivalent price in cacao. Some merchants tried to increase their profits by filling old cacao husks with dirt and mixing them in with real beans. Drinking cacao was the modern equivalent of grinding up money.

—Zachary Nelson

The fruit, while edible, was less valuable than the bean. Cacao beans were a luxury food of the ancient cultures of Mesoamerica. They were required as tribute by the rulers and were bartered for goods and services in marketplaces. Palaces were large consumers of cacao. In the household of King Nezahuacoyotzin of Texcoco (1402–1472 CE) about 50 pounds of cacao were used daily.

Cacao was a form of wealth that could also be easily stored and transported. Tribute bearers were sent out with sacks to the lord. Each sack held 24,000 beans and constituted a *carga*, or load. The sacks were then stored in warehouses near the palace until needed. Maya tribute scenes often included similar sacks, carefully labeled as *kakaw*.

Herding and Breeding of the Alpaca

Alpacas and llamas are the two species of domesticated camelids of the American Andes. Both are high-altitude animals valued for their fur and meat. As domesticated animals they supplemented and eventually replaced their wild hunted ancestors as a source of meat. However, it was as wool producers and sources of meat that llamas and alpacas most deeply influenced the ancient Andes.

Evidence for the earliest domestication of camelids comes from the Andean highlands, where the wild relatives are indigenous. Domestication as documented at places such as Telarmachay Rockshelter suggest a gradual shift to domesticated species beginning with a preference for camelids as hunted prey beginning around 5200 BCE to early domestication at 4000 BCE and a reliance on herding by 3500 BCE. Telarmachay may be anomalous in its early domestication, however, given that evidence from many sites throughout the Andean highlands suggests that hunting continued to predominate

until after 1600 BCE. Scenes painted on Nazca pottery continue to show hunting of wild camelids in addition to herding well into the first millennium CE.

Differentiating domesticated from wild camelids and between individual species in the archaeological record is difficult. Size distribution of skeletal elements overlaps in all four species, and teeth have only small variations. Similarly, hair fineness on the four species varies by age, breeding, and the location sheered, and the overlap between species is considerable. Even biology has been mystified by the relationships between the species until recently because both domesticated species and their wild relatives, the vicuña and guanaco, could all interbreed and produce viable offspring. The most recent genetic evidence indicates that llamas are more closely related to wild guanacos (genus *Lama*), whereas alpacas bear a closer genetic affinity to vicuña (genus *Vicugna*).

Based on analogy to historically documented and contemporary uses, it has often been assumed that the alpaca was domesticated for its fine wool and the larger llama for its meat. Archaeologists, however, have given little consideration to testing this precise hypothesis. Combinations of both species appear in the remains of transhumant agropastoral groups, and both domesticated species show signs of butchery. Age profiles for butchered animals and estimated percentage contributions of alpacas and llamas to herds vary widely across time and space. This suggests that different regions with access to puna environments for herding developed different economic production strategies and adjusted those strategies to prevalent socio-political, economic, and environmental conditions as needed.

Archaeological data from the Lake Titicaca region, the southern Peruvian and northern Chilean coast, and the northern Peruvian highlands reveals several ways in which alpaca and llama influenced cultural development in the Andes. These include both economic and religious contributions.

First, highland sites in both the north and south document the importance of camelid pastoralism to the economy of sedentary agri-

Alpacas pasture in the Peruvian Andes. (Uros Ravbar)

culturalists. Early pastoralists near places such as Chavín de Huántar and in the puna near Junín established trading relationships with sedentary high-altitude farmers, exchanging meat and maybe wool for agricultural products that provided desirable protein to diets heavy in starchy tubers and a supplement to hunted game and smaller domesticates such as guinea pig.

Second, probably always seminomadic pastoralists began to function as caravan traders transporting goods, especially luxury items, long distances north and south along the spine of the Andes as well as between tropical forests, the highlands, and in time the drier coastal regions. Today llamas are the preferred pack animal carrying as much as 133 pounds (60 kilograms), but there is no reason why alpacas or mixtures of the two species could not be used in caravans. Archaeologists have long held that the society at Chavín de Huántar and complex cultures developing in the Lake Titicaca area owe much of their regional preeminence to their relationships with transhumant pastoralists and economies of prestige goods.

Third, wool became a very desirable commodity among coastal and presumably highland weavers. Wool has many advantages over the cotton domesticated in the dry Andean coastal region. Wool from both llama and alpaca comes in a number of naturally occurring hues from white to tan, brown, gray, and black, absent from cotton. The animal fiber is longer and more lustrous than cotton as well as a better insulator. Wool is also a better vehicle for organic dyes, making the vivid array of colors seen in coastal textiles possible. Wool likely became a desired trade item from the highland regions.

Finally, camelids had important ritual significance. Bones appear as parts of burnt and ritually interred offerings in many early religious centers. Camelids, however, held particular importance in the Lake Titicaca region. There the “Camelid Woman” theme became a popular motif in Pucara religious art. Camelids, both alpacas and llamas, continued to appear in fancy pottery and textiles and as modeled votive offerings among Nazca, Tiwanaku, and Huari cultures, a

➤ MILKING IT

Most known pastoral people subsist off a combination of resources that include not only the meat of their animals but also the blood and milk. This includes the milking of horses, yaks, goats, sheep, and camels. We know that early Andean people made use of camelid meat, perfecting the science of cured ch’arqi (the original jerky). Early textiles point to the demand for camelid fiber. Did the early pastoralists also make use of milk and blood from llamas and alpacas, or were they among the few pastoral people not to do so?

Traditional Andean agropastoralists today do not milk their llamas or alpacas, and veterinary and breeding literature outside of the Andes where camelids have been exported cites small quantities of milk produced by nursing dams as a significant issue in the care of neonates. This does not preclude the possibility of ancient breeds producing enough milk that it could be collected and consumed, but it does make it seem unlikely that either llamas or alpacas were ever used for their milk. On the positive side, an inability to produce a storable protein surplus in the form of milk products may have helped to push the freeze-drying of camelid meat and the production of charqui.

■ Introduction: The Exploitation of Natural Resources

New technologies, new trade routes, and new extensive empires led to the exploitation of new resources or, in many cases, the consumption of resources on a more significant scale than previously. The period from 1000 BCE to 300 CE saw the beginnings of the Iron Age in much of Asia and Europe, which required the exploitation of more metal resources than previous periods. This new technology of iron also led to the ability to exploit more resources, especially mineral, as it allowed for the development of significantly stronger tools (for example, tools used in mining and construction) than had been known previously. New extensive trade routes, most notably the Silk Roads that connected much of Asia to Europe, led to the development of larger global markets for local resources and a concomitant rise in the harvesting and consumption of those resources. This was also the period of the first large empires. The Persians, the Romans, the Han Chinese, and the Mauryans of India, for example, consumed the resources of their conquered lands at an incredible rate. Gaining access to these local resources may have been one of the major impulses behind the growth and development of these large empires. The following entries explore some of the major new resources that are exploited at this time and

some of the major changes in exploitation strategy that occurred.

—Kevin M. McGeough

Development of the International Slave Trade

The ancient world relied heavily on the labor of both male and female slaves, and slave markets grew to meet the demand. Although a person could be born a slave, most slaves began their lives as free people but were enslaved in wartime or by pirates. When the Romans conquered Epirus in 167 BCE they created nearly 150,000 new slaves overnight. Victorious commanders or their agents chose first from among the captives; others were sent to the royal palace or to markets run by the state. The remaining slaves were sold to traders who plied their goods throughout their world. Traders also acquired stock from tribes and villages on the periphery of great states, along the Rhine and Danube and the shores of the Black Sea and from various North African communities. Merchants bought and sold slaves as they did any valuable commodities, seeking to acquire those with good health and extraordinary skills, strength, or beauty and to sell them to well-paying custom-

► WHEN AUXILIARIES GO BAD, CIRCA 84 CE

In 84 CE a cohort of the Usipi (a German tribe) that had been transferred to Britain committed a crime remarkable enough to deserve record. The Romans had attached to the Usipi a centurion and soldiers, to teach them Roman military discipline and thereafter serve as models and directors. However, the Usipi murdered the centurion and soldiers. They boarded three warships, and forced the Roman pilots to do their will. Two of these pilots incurred suspicion and were put to death, while the third did as he was told. As the story of the Usipi was still unknown, they sailed along the coasts. But the time soon came when they had to put into land to get water and other necessities. This brought

them to blows with the Britons, who defended their property. Often successful, the Usipi were occasionally repulsed and were finally reduced to such straits of famine that they first ate the weakest of their number and then victims drawn by lot. In this fashion they sailed right round Britain, then lost their ships through bad seamanship, were taken for pirates, and were gradually defeated. When they landed in Suebi and Frisii territory (along the northern European coast) they were captured by those tribes. Some of them were sold as slaves and passed from hand to hand till they reached the Rhine, where they gained notoriety from the circumstantial account of their great adventure.

ers. Female slaves were most valuable during their child-bearing years, and most males were valuable during the years of their greatest physical endurance. Since entire urban populations could be enslaved at a stroke, mature people of great learning, talent, and experience could be found for sale beside illiterate peasants.

Celts, Scythians, North Africans, Germans, Greeks, and Persians were transported to markets by ship and caravan and along Persian and Roman roads. Most major cities had public slave markets where merchants would make rounds. In the Classical period the markets in Rome, Alexandria, and Constantinople flourished. Rome had a market for common laborers in the Forum, but people went to the market in the Saepta Julia to find those with special skills. On the Cycladic Island of Delos, as many as 10,000 slaves were sold on a single day at the end of the second century BCE.

The Acquisition of Horses in Han China

A chronic issue for all Chinese empires was securing sufficient horses for their military. As the major opponent for any empire tended to be the pastoral nomadic horse archers of the steppe, an adequate number of cavalry was necessary not only to counter their attacks but also to carry the battle into nomadic territory. Thus, a major component of the frontier trade between China and the nomads consisted of trading Chinese luxury goods and necessities for horses.

Of course, the quality of the horses would vary considerably depending on the political relations between the nomads and the empire. During the Han period (206 BCE–220 CE), the conflict with the steppe confederation known as the Xiongnu (Huns) necessitated a new source

REPORTED ENSLAVEMENTS OF ROMAN WAR CAPTIVES, 297–167 BCE

Third Samnite War (297–293 BCE)	58,000–77,000
First Punic War (264–241 BCE)	107,000–133,000
Gallic War (225–222 BCE)	32,000
Second Punic War (218–202 BCE)	172,000–186,000
Various wars (201–168 BCE)	153,000
Sack of Epirus (167 BCE)	150,000
Total	672,000–731,000

—Joseph P. Byrne

of horses. Due to the threat of the Xiongnu, Emperor Wu (141–87 BCE) greatly expanded the number of cavalry used in the Han Army, reaching 30,000 to 40,000 troops.

Rumors of blood-sweating horses descended from a heavenly horse reached the Han court during the reign of Emperor Wu. The horses were located in Dayuan or the Ferghana Valley found in central Asia, divided today by present-day Uzbekistan and Tajikistan. The emperor sent an embassy led by Zhang Qian to achieve two goals. The first and foremost was to secure an alliance with the Yuezhi nomads who dwelled in central Asia. This would create a potential two-front war for the Xiongnu, thus relieving considerable pressure on the Han’s northern frontier. Second, Zhang Qian was to find and procure a number of the horses of Ferghana who were known for their phenomenal strength and speed, which according to legend surpassed all other horses. The Dayuan horses were known as heavenly or celestial horses.

Although the horses of the Dayuan were considered the best, the Han were also able to procure large numbers of horses from the Wusun, a tribe that had recently been subjugated by the Xiongnu. Their horses were also of considerable quality and thus became known as Superior Western horses. Both types of horses were not pasture-fed animals like the horses of the Xiongnu, so the Han also brought back fodder for

► BLOOD-SWEATING HORSES

Most of what is known about the fabulous horses of Ferghana is derived from the *Shiji*, a Chinese chronicle from the Han period that recounted Zhang Qian's embassy to the west. In this, these heavenly horses are known as the blood-sweating horses. Despite the colorful sobriquet, the *Shiji* does not elaborate on what "blood sweating" meant.

It is known that the blood sweating was viewed as part of the celestial qualities of the horse in addition to their strength and speed. Indeed, it was how one could be assured that it was indeed a heavenly horse. However, any actual blood sweating had little to do with divine grace but instead had to do with a parasite known as *Parafilaria multipapillosa*. This parasite is found in waters of the Gorgan and Ferghana rivers. During its life cycle the parasite breaks through the skin, thus causing bleeding. The parasite can still be found in livestock in the Ferghana Valley.

—Timothy May

their nourishment. Indeed, the sparse pasture of China would have been insufficient for their needs. Thus, the Han also introduced alfalfa as a crop to China in order to feed their prized steeds.

—Timothy May

Trade in Spices and Medicinal and Dye Plants in Central Asia

As Edward Schafer notes in his book *The Golden Peaches of Samarkand*, the distinction between medicine and food was not clear-cut in the Far East. The same can be said for the Roman em-

pire where particular spices and foods were prescribed for a variety of ailments. It is difficult to tell, in many cases, whether the materials were traded on the open market or whether they were sent as tribute, but it is important to note that not just the plants but also knowledge about how to use them was transmitted.

Mabuang, or ephedra, the original source of ephedrine, which was used to treat respiratory diseases in China, was transported to western Asia and Europe. Sugar from India and Persia reached the Roman empire, where it was used exclusively for medical purposes. Spinach, which originated in Persia or perhaps India, moved westward. Daoists believed that it could be used as an antidote for an overdose of cinna-bar, a red lead used in Daoist potions and pills of immortality. Ginseng from Korea (used as a restorative) and a type of seaweed (used as a diuretic) also traveled from east to west.

Many aromatic gums from the west also traveled to central Asia and China. Gum guggul from the west, probably from Syria or Persia, was an aromatic and was often used to adulterate frankincense. Galbanum or asafoetida from Persia was used to remove odors from the air, despite its rather strong smell. It was also a food additive but could also be used, it was thought, to dispel demons. Frankincense and myrrh, collected from plants in the Middle East, were not only aromatics but were also used in medicines. Frankincense was used to treat ulcerated skin and intestinal ailments. Myrrh was used exclusively in medicine to treat wounds made by metal blades and for pain from specific causes including a fall from a horse or miscarriages.

Dyes utilized in China included oak galls from Persia, which would dye cloth black. Indigo was grown in China as a dye but was imported from Persia to be used in cosmetics. Tumeric, also used as a spice, came from Southeast Asia. As a dye it turned cloth a brilliant yellow orange and also imparted a fragrant scent. Saffron, used in cooking and as a yellow dye, was introduced to China from the west. It was quite expensive, however, and the Chinese used it as a perfume and to flavor wines.

Spices such as pepper, ginger, cardamom, turmeric, nutmeg, mace, and cloves were traded across central Asia and traveled both east and

west along the Silk Roads, and most had medical applications. Cinnamon from Southeast Asia was used in Europe for religious and medical purposes. It was a key ingredient in Jewish anointing oil. Cloves, also from Southeast Asia, were used to sweeten the breath during the Han dynasty and, mixed with ginger extract, was used to dye graying beards black again.

Salt and Salt Mines

Sodium chloride is one of the minerals essential to human and animal life. The Celts at Halstatt mined it to use as a trading commodity. The Celts and the Romans exploited salt mines for rock salt, and the Egyptians had naturally occurring salt-pans in the western desert, but the main supply of salt was obtained by evaporating seawater in coastal areas. In the Roman empire part of a man's pay was made in salt; hence the term *salarium*, or salt money, and the modern term *salary*. In Egypt, salt was an acceptable commodity for bar-

➤ RHUBARB—A MEDICAL MIRACLE

Many medicinal plants were transported over the Silk Roads, and a number of them are still used today but as foods rather than medicines. One of the most popular and lucrative plants traded was rhubarb. Rhubarb, grown in China, was dried to reduce its weight and preserve it. The dried stems were then transported from China to the west. When the stems reached Europe they were marketed as a highly effective cure for constipation. Given the diets of the time, this must have been a very welcome relief.

—Rebecca Wendelken

tering. Salt was a necessity in culinary preparation and was the most efficient preservative known at the time. It also ensured that the proper flavor-producing organisms developed in bacon, ham, cheese, and fish products. Salt is a natural drying agent, which draws water out of a product by osmosis. Food could be rubbed with it or put into casks between layers of salt and pressed with stones so that the natural juices flowed out. Only high-quality products and good-quality salt would ensure a decent result, because poor-quality salt will not penetrate quickly enough and the inner part of the product will deteriorate before the salt or brine reaches the center.

➤ PEPPER AND CUMIN

Pepper was vital in cooking. It was known in Greece by the fifth century BCE as a rare commodity and was probably the long pepper from northeast India. Diphilus of Siphnos (a Greek medical writer of the second century BCE) is said to have put pepper on scallops in the third century BCE, the first known use of the spice in food. Once the trade route to the Far East had been established, pepper became more abundant. Long pepper is hotter than black pepper and was twice its price—so prized was it that it could be used as a currency. It became vital in cookery. Emperor Domitian built special warehouses, *horea piperatoria*, for its storage. Peppercorns, however, do not seem to have

been known in Egypt until the Greco-Roman period.

Cumin, a spicy seed, was well known in the ancient world. Poseidonius (a Greek traveler in the first century BCE) records its use by the Celts to flavor fish and wine. It was usually ground before use and acted as a cheap flavoring. Apicius was lavish in its use, especially for fish. Ground cumin could be mixed with salt in classical Greece to enhance both appearance and flavor. It was widely used in medicine, being recommended in particular for stomach pains. A basketful of cumin seeds was found in the burial place of Khe, architect to Amenophis, at Deir el-Medina, Egypt.

—Joan P. Alcock

The Romans kept salt production under imperial control, organized by a procurator, although extraction and distribution could be leased to private contractors. The salt produced was of a grayish color, so it was often mixed with herbs when placed on the table. Brine mixed with vinegar could be used in preparation of *liquamen*, and the use of this produce often canceled the need for salt. Several different types of salt were known. Herodotus mentioned that in Libya a purple salt was mined. Different types of salt named in lists in Egyptian tombs mention a red salt. Salt producers could have important status. In Egypt, Ramses III granted them special privileges. Salt sprinkled on bread was offered to guests as a sign that they were welcomed, and acceptance of this meant that the guest agreed that no harm would be done to the household. Natron, a crystalline mixture of sodium carbonate (washing soda), sodium bicarbonate (baking soda), and sodium chloride (salt), was not used in Egypt for cooking but was used extensively in preparing bodies for mummification, as its dehydrating action decreases fatty tissue.

Exploitation of Jade Resources in Central America

Spanish conquerors invaded the New World in search of gold, but for the natives jade was more highly valued. It was prized throughout Mesoamerica for its symbolism, medicinal value, and hardness. This was not true mineralogical jade (nephrite) but rather a type of stone known as jadeite, although the incorrect designation "jade" is usually used by Mesoamerican archaeologists. Jade objects were used as barter, and fine pieces were passed down as heirlooms. By the Ojochi ceramic phase of the Olmec civilization

(1500–1350 BCE), manufactured jade objects were already being buried in ceremonial contexts at El Manatí, located in Veracruz, Mexico. Jade lapidary production blossomed by 900 BCE and continued in importance through the arrival of the Spanish. After the conquest, production ceased because Europeans valued gold, not *chalchibuitl* (jade).

Because jade objects are found in archaeological contexts from central Mexico to Costa Rica, it has been assumed that there were multiple loci of naturally occurring jade deposits. Chemical compositional tests performed on jade objects seem to bear this out, as they display different chemical signatures. However, only a single area has been archaeologically verified as having jade sources. The Montagua River valley in Guatemala is the only verified source of jade in Central America. The steep volcanic mountains provided nature with the perfect ingredients to make this tough silicate. Naturally occurring jade is present as outcrops, boulders, and river wash.

From archaeological reconnaissance in the area, jade outcrops of particular hues (for jade ranges in color from purple to blue-green to deep green) were sought out at different times. Olmec cultures prized translucent blue-green, while the later Maya and Aztec valued greens. All of these varieties are present in the Montagua region. Due to its hardness, jade was originally removed from exposed outcrops probably via heating with fire. When pieces spalled off due to the heat, they were examined for homogeneity. Minute fractures in the jade spalls would cause severe difficulties later, so only the best pieces were selected. Alternatively, jade prospectors could examine the river for jade pebbles and smaller rocks, but always with an eye for high-quality stone. The spalls and large raw jade fragments are known as preforms.

The jade preforms were flint knapped with percussion blows using a jade hammerstone. Sometimes the preforms were placed on a jade boulder (anvil) and then struck to facilitate removing large unwanted flakes. The preforms were rough-shaped near the source and then exported for final shaping to centers with flint-knapping specialists. Irregularities in the stone were removed with pressure, sanding, pecking,

► JADE'S MANY SHADES

Jade symbolized many things for the ancient cultures of Mesoamerica. First, its green-toned color represented vegetation. Jade also symbolized the breath of life. Jade beads were often placed in the mouths of the deceased so that their souls could be aided on its journey. Rulers incorporated jade in their regalia. The Aztecs used jade as a medicinal aid for urinary tract ailments. Finally, jade was one of the hardest stones known to the premetal societies of ancient Mesoamerica. It was difficult to fashion into objects, hard to polish, and hence valuable in terms of the effort imparted in its manufacture.

Jade votive axe, olmec, 1200–400 BCE
(Jupiterimages)

► EXPLOITATION OF COPPER NEAR THE GREAT LAKES

The prehistoric exploitation of Great Lakes copper by Native American societies in eastern North America emerged in the Late Archaic period (approximately 3000 BCE) and continued until European contact. However, the intensity of these copper-mining activities fluctuated through time. The three most concerted periods of copper exploitation in eastern North America were during the Late Archaic period from 3000 BCE to 1000 BCE, the Early to Middle Woodland period from 500 BCE to 400 CE, and the Mississippian period from 1000 to 1300 CE. Prehistoric copper artifacts are primarily found with burials and in caches that often occur in mounds; they were not generally deposited in domestic contexts.

The majority of prehistoric mines in eastern North America are located around Lake Superior on the Keweenaw Peninsula and Isle Royale in Michigan as well as the eastern edge of Lake Superior, north of Saint Mary's River in Ontario, Canada. The amount of copper estimated to have been prehistorically mined from these Lake Superior sources ranges from 5.6 million to 2 billion pounds. Float copper, deposited from glacial-fluvial processes, and other natural deposits of copper, especially those in the southern Appalachian Piedmont, also constitute important prehistoric sources.

Prehistoric copper implements in eastern North America were consistently associated with ritual practices instead of utilitarian uses. Cold hammering and annealing methods were employed to work the copper into a particular shape by pounding it and alternately heating and cooling it. During the Late Archaic, most of the copper implements generally resembled utilitarian forms, but ceremonial copper objects became dominant during subsequent periods. During the Middle Woodland and Mississippian periods, many copper artifacts, such as earspools, breastplates, and repoussé plaques, were worn in various ceremonial regalia.

Exploitation of Natural Resources in the Caribbean

Between 1000 BCE and 500 BCE in the Caribbean, during what archaeologists call the Archaic Age, the Amerindian economy varied between islands based on the plants and animals that were locally available. Trade and exchange between communities and between islands during this period can be reconstructed using stone tools and other artifacts made of raw materials for which the geological source is known. For example, the

wide distribution of a specific type of chert traceable to a source on Long Island, Antigua, indicates that Amerindians living in the Caribbean islands during the Archaic Age were either going to the source themselves or more likely obtaining the material through a series of exchanges.

During the subsequent Early Ceramic Age (ca. 500 BCE to 300 CE), larger populations of seafaring people established permanent settlements throughout the region and developed an extensive network of interisland and island-mainland trade and exchange to support their socioeconomic needs. They balanced reliance on introduced domesticated crops such as cassava and naturally present terrestrial resources such as land crabs and rice rats with marine resources, including fish and shellfish. Archaeological evidence indicates that these Amerindians were expert mariners, trading and exchanging a variety of goods and materials between communities on different islands, some located great distances from one another.

Long-distance trade and exchange is best represented by the presence of gemstones and other materials not naturally present on the islands on which they were recovered archaeologically. Evidence of continued travel and transportation between the islands and the mainland indicates that islanders maintained contact with their mainland homeland for several centuries after they had settled in the Caribbean. In terms of the production of beads and other lapidary items, certain villages appear to have specialized in the manufacture of ornaments such as beads made out of certain raw materials. For example, the village of Pearls on Grenada apparently produced beads from amethyst, while the village of Trants on Montserrat yielded extensive evidence of bead making using the reddish-orange mineral carnelian. Many of the gemstones represented in Early Ceramic Age sites are naturally available in the islands, while others are more clearly of more distant mainland origin. For example, the amethyst likely was traded into the southern islands from sources on the mainland, perhaps Brazil. Other materials such as nephrite, jadeite, and turquoise are also believed to have originated on the mainland and were ultimately traded or exchanged into island communities during the Early Ceramic Age.

Stone beads from the Early Ceramic Age Trants site on the island of Montserrat, West Indies. (John Crock)

In addition to ornaments made of locally available materials such as carnelian and crystal quartz, the site of Royalls on Antigua has yielded a stone ax made of jadeite, which has been chemically sourced to Guatemala. Other materials exchanged likely included ceramic bowls, jars and other vessels, and shell tools as well as perishable items that do not preserve to be studied, such as feathers and foods that were available on some islands but not on others. By the end of the Early Ceramic Age (ca. 300 CE), the trade in exotic gemstones and other ornaments

dropped off in favor of greater volumes of utilitarian goods and ornaments made of locally available materials such as shell.

■ Introduction: Industrial Developments and New Types of Manufacturing

When ancient historians discuss industry, they are not referring to industry in the manner in which we think of it today. The technologies and systems of organization that developed in the European Industrial Revolution transformed the scale of production dramatically from what had come before. What historians are referring to by the term “industry” is the production of goods beyond what can be consumed by the individual producer, usually in order to trade or sell those goods for other types of goods.

Throughout the period from 1000 BCE to 300 CE, the scale of manufacture of goods increases throughout much of the globe. The speed of production and the amount of goods produced grew substantially, with changes in the organization of production and the technologies used in workshops. In the parts of the Americas where an increase in manufacturing is apparent (mostly parts of Mesoamerica and South America), the increase in production developed with the increased urbanization and demographic growth of the region. In Europe and Asia, the development of more extensive trade networks and the growing interdependency of people on these trade networks necessitated the development of production techniques that allowed goods to be produced quickly and cheaply. The growth of large empires also

spurred the development of industrial-scale manufacturing, as the core areas of the empire were anxious to consume the products made in the periphery.

—Kevin M. McGeough

Greek Building Projects of the Fifth and Fourth Centuries

In the fifth and fourth centuries BCE the Greek city-states had achieved a high level of literacy and democracy. During this period, temple-building projects were carried out using public funds. Official records were carved on stone slabs called stelae and were prominently displayed to inform citizens of how the building projects were organized and on which specific items and services the money was being spent. Surviving temple-building accounts from Athens, Epidauros, Delos, and Didyma provide detailed records of how large-scale construction projects were coordinated and include the costs of different materials and labor in classical Greece.

The structures on the Athenian Acropolis were built in the second half of the fifth century BCE and were commissioned by the Athenian statesman Perikles to replace structures that had been destroyed in the Persian invasion of Greece

THE TEMPLE OF ASKLEPIOS AT EPIDAUROS

(Sharon Mollenus)

The temple of Asklepios at Epidauros was built during roughly 380–375 BCE. Its construction is described in the detailed building accounts from the site. This Doric temple was designed by the architect Theodotos, who was paid a salary of one drachma per day. The sculptures in and above each end of the roof were crafted by three sculptors. Their names are listed as Timotheos, Hektoridas, and a third sculptor whose name begins “THEO...”; however, the end of this name is cut off on the marble stele. The building was constructed using limestone from nearby quarries except for the sculptures, which required imported marble. The gold and ivory cult statue of Asklepios was the work of a specialist, Thrasimides of Paros. All together the temple cost almost 100,000 drachmas, or about 200 pounds (440 kilograms) of silver.

—Angela Murock Hussein

in 480 BCE. The project was paid for in part by funds collected from the Delian League, an alliance of cities formed and led by Athens. There were four major components to the reconstruction project on the Athenian Acropolis. The Parthenon was part temple to Athena and part treasury to house tribute money from the Delian League. The Uruktheion was a temple that housed objects from the most important religious cults of Athens. The Temple of Athena Nike was a small shrine to victory. And the Propylaia was a monumental entranceway to the Acropolis. To oversee these projects, the city appointed separate commissions to each one. Every year the names of the commissioners were

recorded at the head of each new entry on the building account stelae before the financial information for that year. Workers on the buildings were paid according to their trades, such as stone quarryman or sculptor. Evidently, the largest expense was the transport of the high-quality white marble overland from Mt. Pentelikos. Excess building materials were sold to help pay for the structures.

In the fourth century Epidauros planned an elaborate series of buildings for the doctor god Asklepios. His cult places were pilgrimage destinations for the sick that had increased in popularity after a plague in the late fifth century BCE. The sanctuary of Asklepios at his birthplace, Epidauros, was the largest. It included a temple, a theater, a tholos or round building of uncertain function, and an abaton or place to house the sick. The construction accounts for this sanctuary are the most complete to have survived from ancient Greece. The tasks mentioned in the construction lists were divided up according to the part of the building (i.e., floor, colonnade, main structure) and also according to the craft involved (i.e., quarrying, transport of stone, polishing the finished walls and floors, ironwork on the roof and doors). Contractors were paid a part of their fee in advance, but money was deducted if the tasks were not completed on time.

Glass Manufacture

By 1000 BCE, glass had been made for centuries in the Near East, Egypt, and parts of Europe, Iran, and India. Objects were formed in or over molds or were carved from glass ingots. Most vessels were made by dipping a clay-and-dung core into viscous liquid glass or by winding a

trail of glass around a core; when the vessel cooled, the core was scraped out.

After a late second-millennium dip, Near Eastern glass production revived from around 900 BCE, and from the eighth century glass again became common. Its main center of production was Phoenicia; Phoenician glassmakers were also active in Mesopotamia. Glass was probably produced in a few centers and the ingots traded to be worked more widely.

Recipes for different types of glass survive mainly in the seventh-century library at Nineveh, although earlier ones are also known. Most concerned the production of small glass objects such as inlays; from the eighth century BCE these were cast in open or closed molds as decorations for furniture, ivory objects, and jewelry. Colored opaque glass was made in imitation of gemstones. In Neo-Assyrian Mesopotamia clear blue and purple glass imitating rock crystal was preferred.

Distinctive rod-formed pendants were made by the Phoenicians in the shape of animals and human and demonic heads and masks. The principal products of both Near Eastern schools were carved, core-coated, cast or molded vessels, sometimes with engraved or painted decoration; they also included fine molded mosaic glass vessels. Polychrome mosaic glass tiles were popular in Assyria from the eighth century; these were assembled in a mold from glass canes, giving a mosaic pattern right through, or the mold was filled with a blue glass matrix into which white glass petals were pressed to form rosettes visible only on one side. Mesopotamia continued as a center of glass production under the Persians, particularly producing luxury tableware in shapes imitating those in precious metals.

Trade spread Phoenician glass products through the Mediterranean lands, and by the seventh century new centers sprang up in Italy and Greece, making polychrome core-formed perfume and unguent containers decorated with trails.

A separate glass-making industry developed in barbarian Europe, mainly producing decorative elements for jewelry, often patterned with glass trails. Some central European settlements made distinctive handled small bowls decorated with vertical ribs. In the late centuries BCE Celtic

GLASS IN INDIA

In early India, glass was used almost exclusively to make huge quantities of beads, but from the later centuries BCE glass bangles and earspools were also made. China acquired glass beads from the West in the fifth century BCE but soon developed its own industry, making glass containing barium and a high proportion of lead. This resembled jade for which glass was used as a cheaper substitute. The glass objects, which included beads, decorated plaques, small model animals, and even plates for burial suits, were either carved from blocks or formed in a mold.

—Jane R. McIntosh

Europe also manufactured bangles, massive ring beads, and small figurines. While Mediterranean centers now used Egyptian natron for the alkali in glass, the Celts continued to use plant ash.

By the late first millennium many colors were available: opaque yellow, from antimony with lead; white, from tin oxide or antimony; amber, from iron oxide; violet, pink, and purple, from manganese; brown, from manganese with iron oxide; blue, from cobalt; and blue, turquoise, and green, from copper. In Germanic Europe (and occasionally elsewhere) sealing-wax red glass was made by adding cuprous oxide and lead to the glass mixture and heating it in reducing (oxygen-free) conditions; it was used particularly for decorative inlays in bronze vessels and jewelry.

Most significantly, it was now possible to reliably produce colorless glass. This had occasionally been made before by adding antimony to neutralize the colorant effects of the iron oxide present in sand (a principal ingredient of glass), which imparted a green-yellow-brownish hue. Now, however, glassmakers substituted manganese for antimony or used fine silver iron-free sand from Belus in Syria and the Volturnus River in Campania. Colorless glass became very popular in the Roman world from the first century CE, probably in imitation of highly valued rock crystal.

Enameling, known from the thirteenth century, only became common in the late first millennium BCE when it replaced glass inlays,

particularly in Celtic Europe where it decorated fine objects such as jewelery, parade armor, and horse trappings. A thick paste of very finely ground glass and water was used to fill raised (cloisonné) or cutaway (champlevé) cells in a metal object. After drying, the glass was fused by heating and finished by grinding and polishing.

Glass production virtually ceased in Egypt in the eleventh century BCE. Successive political changes did not affect the major role that coastal Syria played in the glass industry, but in Hellenistic times the Mesopotamian school declined, and its place as a major glass-producing center shifted (along with its craftsmen) to Alexandria. From the late first century BCE the Romans became major patrons of glass production, and Alexandrian craftsmen established a glass industry in Rome.

Syria produced mosaic glass vessels, which were popular with the Roman market. The technique dates back to the second millennium. Thick canes were made by fusing together a number of multicolored glass rods. Canes of concentric colored rings were formed by taking successive gathers of different colors. Hellenistic glassmakers also created spiral and star-shaped canes. After stretching to miniaturize their pattern, they cut canes into segments that were arranged as a disk and fused by heating. This was generally sagged over a mold to form a bowl. Some of the finest pieces were designed to imitate variegated stone. A variant, network ware, used canes made of contrasting colored rods spirally twisted together, producing a pattern resembling a net. Pictorial enamel inlays and medallions were similarly built up in a mold using rod or cane segments.

The Mediterranean glass industry was transformed in the mid-first century BCE when Syrian craftsmen discovered how to blow glass both into a mold and by free blowing, techniques that under Roman patronage were brought to a level of sophistication from which there has since been almost no further development. Glass-blowing technology was spread by Syrian craftsmen who settled in Europe.

Complex vessels, including novelty shapes such as fishes or human heads, could be blown in molds made in several pieces. Molds allowed vessels to be blown in standardized sizes and in

various useful shapes, such as square-based containers with straight sides that packed easily, making them ideal for transporting goods. As mold blowing was very quick, by the later first century CE blown-glass vessels largely superseded those made by other methods. Glass vessels might be decorated with engraved, facet-cut, or enamel-painted designs or with applied glass trails, which were also used to add bases and handles. Bases might also be pulled out with pincers, as might the rim and neck and the decorative ribs of ribbed bowls, popular in the first century CE.

The mold could be decorated. Often the base held an inscription, and first century CE designs included chariot races and gladiatorial combat. From the second century, however, mold-blown vessels became generally plain and utilitarian. Fine glassware now comprised colorless or clear monochrome cast vessels, beautifully finished, imitating the shapes and sometimes the appearance of valuable rock crystal, bronze, and silver vessels.

Glass blocks, like gemstone, were cut into various shapes, particularly jewelery, amulets, and seals but also figurines and small vessels; more commonly the same lapidary techniques were used to finish or decorate glass objects. A separate body of Roman craftsmen, the *diatretarii*, created finely decorated pieces from cast or blown blanks, using lathe cutting, wheel engraving, grinding, and polishing. The designs were mainly floral or geometric but could also be figural.

The most elaborate pieces, such as the famous Portland Vase, had bas-relief designs in a color contrasting with that of the background vessel, produced by the extremely skilled technique of casing, blowing an inner layer of dark-colored glass into a thick cast outer shell of opaque glass while the latter was still hot, then blowing the coalesced two-layered blank. An alternative was flashing. A heated inner vessel was dipped into molten glass to form the outer layer, or a heated gob of glass was similarly dipped into molten glass, and the combined layered glass was blown, an extremely difficult process that the Romans occasionally used to produce glass with up to six differently colored layers. After the outer layer was cooled,

it was selectively cut away to leave the design. Cameo vessels, architectural plaques, and jewelry were made for about 75 years from around 25 BCE.

Impressive gilded vessels were made in Hellenistic Alexandria by casting two clear glass vessels that fitted tightly one inside the other. Intricate designs in gold foil were applied on the outer surface of the inner vessel, and the two vessels were sandwiched together and fused at the edges. More simply, gold-leaf designs could be sandwiched between two pieces of colorless glass. In the third and fourth centuries CE in Rome the technique was used to produce gold-glass disks as vessel bases, with a huge range of secular and religious designs.

The first century CE saw the first production of glass panes. These could be cast in a mold or made by pulling a heated glass disk into a rectangular shape. Alternatively, a blown-glass cylinder was cut along one side, reheated, and flattened. Glass panes were initially expensive but later became common.

Development of Standardized Mud Brick in Moche Construction

From 200 BCE to 600 CE, the Moche people molded, marked, and transported billions of sun-dried mud bricks to administrative and religious centers along Peru's northern coastline for the purpose of building such state-sponsored structures as pyramids, platforms, palaces, and canals. Two mountainous flat-topped pyramids located at the Moche capital of Cerro

Blanco, the renowned Huaca del Sol and Huaca de la Luna, were comprised of over 143 million and 50 million bricks, respectively. Anthropologists Michael Moseley and Charles Hastings observed that even though the Moche made all the bricks at Cerro Blanco in four-sided molds, open on the top and bottom, the bricks nevertheless varied in terms of composition, dimensions, mold marks, and makers' marks. An analysis of the distribution of these variables revealed a brick sequence useful for understanding the production and use of bricks as well as chronologically ordering building phases. Over time thick bricks replaced thin bricks, flat-sided bricks made in molds constructed of smooth slats replaced cane-marked bricks made in molds of cane sections stacked horizontally, and bricks with makers' marks replaced those without. The Moche built both *huacas* in segments of columns of bonded bricks stacked one beside another; the columns themselves were not mortared together. The manner of construction coupled with evidence that the adobe bricks within each construction segment typically exhibited uniform composition, dimensions, and a single unique maker's mark led Hastings and Moseley to conclude that Moche lords required their subjects to contribute building materials and corvée labor to large-scale architectural projects. The work accomplished by Moseley and Hastings in the Chan Chan-Moche Valley Project has prompted further systematic studies of Moche bricks such as Donald McClelland's efforts to develop a brick typology and seriation at Pacatnamu and Izumi Shamada's examination of the organizational significance of marked bricks and associated building techniques for both the Labor Tax Model and the Sponsor Model.

■ Introduction: New Features for Promotion of Commerce and Trade

Global trade and commerce expand dramatically throughout the period from 1000 BCE to 300 CE. The development of new trade routes and the growth of empires and larger polities meant that many parts of the world were significantly more interconnected than in previous times. With this greater interconnection came new advances that promoted commerce and trade. Better transportation infrastructure, such as Roman roads, made the transportation of goods easier (and the suppression of piracy made traveling with expensive goods safer). The use of the Semitic alphabet by Phoenician and Greek traders may have been of benefit, but certainly the appearance of formal market centers and port facilities enhanced trade.

The most significant of these advances, however, was the development of coinage. This was the period in which currency, in a form close to what is used globally today (although the basis of the value of today's currency is significantly more complex), first appeared. Coins, minted by some form of governmental body, made trade and commerce easier. Instead of having to find a seller who wanted the specific kind of goods that the prospective buyer possessed in order to be able to trade (as was typical in a barter system), the buyer would already have converted this wealth into an abstract form that any seller would want. Similarly, this type of wealth did not go bad (like foodstuffs might). Although inflation and other issues could devalue the currency, the bearer of the coins still had the metal that the coin was made from, unlike a farmer whose crops only last for a certain length of time before spoiling. This ability to convert wealth into a permanent form allowed people to have savings. Coinage is a fundamental underpinning of economics today, and its development is one of the most significant events in global history from 1000 BCE to 300 CE.

—Kevin M. McGeough

The Greek Adoption of the Phoenician Alphabet

By the thirteenth century BCE, at the very latest, the inhabitants of the Greek mainland and the island of Crete were speaking Greek. Indeed, some scholars, from the analysis of place names and archaeological data, believe that Greek speakers (or people speaking proto-Greek) had arrived by 2000 BCE. This makes Greek the oldest of all European languages with a continuous history lasting at least 3,300 years, possibly even 4,000 years. Although its origins are unclear, it belongs to the Indo-European family of languages, which extends from Iceland to Bangladesh. This includes Latin and all the Romance languages, the Germanic languages, Sanskrit, and many others.

Until the Hellenistic period, Greek existed in a number of different dialects, the most important of which were Aeolic, Doric, Ionic, and Attic. These dialects do not, however, invariably correspond to ethnic divisions within the Greek “race.” For instance, the inhabitants of Halikarnassos, modern Bodrum on the Turkish coast, who were Dorians, spoke in an Ionic dialect. Following the conquests of Alexander the Great, a dialect called *koine*, or “common,” became the educated tongue of the entire Hellenistic world. Koine is the dialect in which the New Testament is written.

The evidence for the existence of the Greek language in the Bronze Age derives from a pre-alphabetical Greek script called Linear B, which was deciphered by a 30-year-old English architect named Michael Ventris in 1952. It is so named in order to distinguish it from an earlier, still undeciphered, script called Linear A, which may or may not have been Greek. (Linear A was used extensively throughout the Minoan world in the period from 1800 to 1450 BCE. Because it has not been deciphered, it is not known whether the Minoans were in fact Greek speakers.) Linear B was based on the principle that one sign represents one syllable. Objects are de-

ANCIENT GREEK LITERACY

For many years after the alphabet was first introduced, only a small number of Greeks would have been literate. We do not know whether Homer was literate, though he certainly knew about writing because he makes reference to it in the *Iliad*. However, his poems were transmitted primarily through the oral tradition by rhapsodes (literally “song-stitchers”), professional reciters of poetry, who may or may not have been literate.

We do not know what percentage of the population could read and write at any period of Greek history. What is abundantly clear, however, is that mass literacy never existed on the scale that it exists today. Historian William Harris has estimated that no more than 30 percent of the Greek population was literate at any one time. Levels of literacy varied from one place to another and from one social group to another. One of the highest levels was achieved by Classical Athens, whose democratic constitution was based on the principle that a substantial proportion of the (male) citizenry could read the often lengthy and extremely detailed documents that were recorded on stone, and that the majority at least achieved craft literacy, that is, they were able to read material related to their sphere of work. In Sparta, by contrast, where few written records were kept, most of the population was probably completely illiterate.

Literacy is likely to have been practically nonexistent among women, those who belonged to the lower social classes, and slaves. In each group, however, there were exceptions. Evidence from vase painting, including an Attic red-figure vase dated around 440 BCE that depicts a seated woman sometimes identified as the poetess Sappho reading a roll, suggests, however, that some Athenian women were literate. Informal graffiti indicates that literacy was not exclusively limited to the elite. Lastly, the job of some slaves was to keep accounts of financial transactions or to read aloud to their masters and mistresses. It was slaves, too, who made multiple copies of literary works that went on sale.

Despite the importance of literacy in Greek society, much more information and learning was passed down by word of mouth than is the case in our society. At all periods and places, there was a ready audience for recitals of all sorts, not just musical but also literary. The historian Herodotus, for instance, first promulgated his work through oral recitation in Athens, and oral recitation remained a popular form of communication throughout antiquity.

—Robert Garland

noted by ideograms—that is, signs that were originally pictorial. Clay tablets engraved in Linear B by means of a sharp instrument have been found at Mycenai, Tiryns, Thebes, Pylos, and Knossos (Crete). Most of them date to the thirteenth century BCE. There is very little regional variation, which suggests a high degree of administrative centralization. It was used mainly for accounting records, as in the following tablet from Pylos: “Kokalos repaid the following quantity of olive oil to Eumedes: 648 liters; from Ipsewas 38 stirrup-jars.” With the collapse of the Mycenaean world, the script died out and literacy disappeared.

Greece remained illiterate for over four hundred years. Then, in the early eighth century BCE, the Greeks came into contact with a seafaring people called the Phoenicians, who inhab-

ited cities on the coast of Syria. They adapted the Phoenician alphabet to their own language by adding 7 vowel sounds (i.e., a, short and long e, i, short and long o, and u) to the original 16 consonants, making it a much more flexible script. Many of the Phoenician names for the letters entered the Greek alphabet virtually unchanged, including aleph (alpha) meaning “ox-head” and beth (beta) meaning “house.” The same letters also functioned as a numerical system and were used for musical notation.

The earliest surviving examples of the Greek alphabet are dated around 740 BCE. Some scholars maintain that the Greeks first used the alphabet for trade and commerce, others for preserving epic poetry. The earliest examples of Greek writing are, in fact, lines written in epic verse. Before long, however, letters had come to serve a variety

of purposes. Although some states had a few local variants, the alphabet became standardized by the early fourth century BCE. The Greek alphabet was destined to become the basis for other European scripts, including Latin, modern Greek, and Cyrillic.

Coinage

When people live in complex societies, they often need a way of storing up savings, a measure of value by which different items can be compared and/or a means of payment or exchange. Money fulfills all these needs, and one form of money is coinage. Coins are made of metal, of standard alloy and size, with a design that symbolizes the authority that made them and guarantees their value. Coins were first developed in two areas: China and Lydia (western Turkey). With no contemporary written account of either invention, early coins need to be studied in

their full archaeological context to learn more about them.

In China, the role of high-value money was taken by gold, silver, silk, or other precious goods, but bronze also gained status through its use in ritual vessels. Bronze coins in the shape of spades were first issued by rulers of the Eastern Zhou states perhaps as early as the late seventh century or the early sixth century BCE. Other states then began to issue coins in the shape of spades, knives, shells, or disks with a hole in them. The bronze was cast in stone molds and was often inscribed with a weight, place name, or clan name. When Emperor Shihuang of Qin subdued all the other states circa 221 BCE, Qin coins became legal tender throughout the empire. They were bronze disks with a square hole in the center, marked with the weight “half-liang.” This shape of cash would persist in China and throughout East Asia for more than 2,000 years.

In Lydia, coins originated around the same time but in more precious metal. Lydian kings dominated the (mainly Greek) cities of western Asia Minor in the seventh century to the mid-sixth century BCE. Their capital, Sardis, lay on the Pactolus River out of which electrum, a natural alloy of gold and silver, could be panned. The Lydians spread this natural wealth by standardizing the alloy and issuing pellets of set weights, from a unit to tiny fractions weighing 1/96th of that. Some just had punch marks on one side, but many pellets were placed on a carved die to be punched, resulting in coins that

► SILVER TETRADRACHM FROM ATHENS, GREECE, CIRCA 480 BCE

Silver tetradrachm from Athens, Greece (around 480 BCE). On the obverse (front) is the head of the goddess Athena, and on the reverse the owl, a bird associated with the goddess. These designs remained unchanged on Athenian coinage for over three hundred years, and the ‘owls’ of Athens became familiar coins throughout the Greek world.

(British Museum/Art Resource, NY)

showed the die's pattern in relief. The coins, whose punch marks and standards fall into six groups, have scores of symbols (lion, bull, deer, etc.), but most have no writing; only the Lydian lions and the seal (*phoke*) of the Greek city Phokaia seem certain. Several mints were in operation by circa 650–625 BCE, when a hoard of electrum coins was buried in a pot of that date under the Temple of Artemis in Ephesos. It is likely that the coins were issued and circulated at a value higher than their intrinsic one within their home territories and simply at their metal's value elsewhere.

Lydia's last king, Croesus (ca. 561–546 BCE), minted separate coins of gold and silver, while cities in his realm began to coin silver, deposits of which were more common than electrum or gold. Silver coinage spread farther than electrum. The tribes of Macedonia, the island city of Aegina, Athens and Corinth on the Greek mainland, and Greek cities of southern Italy and Sicily all began to issue coins of varying standards and designs. Persia, which conquered Lydia (ca. 546/547 BCE), used coins far less but allowed some Lydian-type coinage to continue, later substituting its own coins in a similar form but with the image of a Persian archer.

By the end of the sixth century BCE, more than 100 Greek cities were minting coins, often with their names and symbols of civic pride. One possible reason for the popularity of coinage among Greek cities is their frequent interaction and rivalry: if one issued coins with its name and symbols, others did the same in order to show that they were of equal wealth, status, or sophistication. Another motive might have been within the city, where one group in power could foster its own political program and freeze others out by issuing coins, but little is known of internal politics for any city except Athens, and Athens was not typical. Outside any city, its coins were valued at their weight in silver. The Carthaginians and Phoenicians, known to be great traders, used these or uncoined silver, only issuing their own coins later, in the fifth century BCE.

No matter what the original motives, coinage strengthened a city as a central power, giving it prestige and profit and enabling it to collect fines and taxes, supply armies and na-

vies, and build temples and public amenities. Coinage also let people set prices, sell, buy, lend, borrow, give dowries, and establish credit for businesses. Coinage is not a requirement for any of these but tends to intensify them all. Small-scale exchanges were eased by the introduction of bronze instead of tiny silver fractions for low denominations in the late fifth century BCE. Although a bronze coin had little intrinsic value, it was accepted insofar as a set number of them could be exchanged for silver.

Some cities in central Italy had used weighed bronze as money, and one of them, Rome, added a Greek-style silver coinage around 300 BCE. Rome's conquests and empire would gradually extend the first trimetallic coinage (gold and silver with bronze often minted locally, ca. 27 BCE–268 CE) around the Mediterranean world. Although based on Greek coins, Roman coin images were more variable, and from the mid-second century BCE on often referred to powerful men and families, politics, or patriotic themes. Roman moneyers (the technical term for people who make money) embraced portraiture, first of past leaders and then of living ones starting with Julius Caesar (d. 44 BCE); afterward it became usual that the living emperor (or occasionally members of his family) should appear on coin obverses. The reverse side could depict a variety of images, usually focused on the emperor's (or for local bronzes, the city's) patron gods, buildings, or achievements. Roman imperial coins, though struck in enormous numbers, achieved both regularity and fine detail for most of their history.

Greek and Roman Port Facilities and Market Structures

Commerce in the ancient Mediterranean world, particularly in Greece and Rome, was characterized by the reliance on foreign trade links established in North Africa, the Levant, Egypt, and the Black Sea region. The establishment of such vital trade links was ensured by naval and military might, imperial expansion, and effective commercial fleets. It was also made possible by the maintenance of important port cities attached to the imperial capitals. Classical Athens, the Hellenistic capital cities, and the city of Rome all had their port structures, which were pivotal in funneling the wealth of the Mediterranean into their market structures.

Ancient Greece, dominated by rocky soils that made cultivation difficult, relied on foreign supplies of grain to feed the native populace. Greek colonization abroad and merchant fleets were responsible for creating important commercial connections abroad to ensure consistent supplies of grain from the greater Mediterranean world to the Greek city-states. The rise of Athens as an important power in ancient Classical Greece not only rested on its naval and military power but also on its ability to supply its empire with grain from abroad. In exchange for finished goods such as ceramics, Athens was able to expand its trade networks as far as the Black Sea.

Athens' port of Piraeus, five miles (eight kilometers) from the city on the Saronic Gulf, served as a major hub of trade for the Athenian empire. A road between Athens and Piraeus secured by the Long Walls of Athens ensured that grain supplies were always accessible. A powerful Greek fleet ensured that important maritime trade routes were secured from pirates and foreign attacks. Vulnerability to famine demanded that Athens ensure the security of grain from overseas.

Hellenistic Greece established far more expansive markets by building on the trade networks established by the Greek city-states and through conquest of eastern provinces at the expense of the Persian empire and Egypt. The successor kingdoms of Alexander also depended to a large extent on foreign grain but in addition developed a lucrative system of exchange with foreign markets farther east, namely India and China. The development of the island of Rhodes as a trade hub for grain for the Hellenistic world ensured it centuries of wealth and importance, with its ports teeming with grain fleets. The mere expanse of the Hellenistic kingdoms in addition to the stability of the Mediterranean ensured the growth of trade in the region. The powerful Ptolemaic fleet stabilized the eastern Mediterranean from piracy and the incursions of invaders. Important centers of trade such as Alexandria, Antioch, and Athens thrived from the vast wealth made possible through the greater expansion of commerce in the Hellenistic world.

The city of Rome had long-established trade connections within the Hellenistic world and through its own territorial expansion managed to integrate the Mediterranean world into a common market. Throughout the republic and the later empire, the Roman economy rested on a vast trade network spanning Europe, North Africa, the Middle East, and the former Hellenistic kingdoms. Imperial conquests brought tribute and wealth to the city of Rome in addition to establishing its hegemony over most of the Mediterranean world. The Roman port of Ostia served as the artery of Mediterranean trade funneling into the imperial capital. Efficient distribution networks ensured that the port of Ostia supplied the needs of the capital. Roman roads, famous for their efficiency and durability, were built throughout the dominions, ensuring land-

➤ OSTIA—PORT OF THE ROMAN EMPIRE

Ostia's importance in the Roman empire rested on its status as the principal port for the city of Rome. The city served as a commercial hub for all trade to and from Rome, connected to the capital through the Tiber River. As a major port city, Ostia served as the main conduit of grain from the greater Roman empire to Rome. As the most important port in the Roman world, Ostia was privy to vast amounts of wealth, illustrative in its monuments, buildings, and cultural life. Furthermore, its development as a resort city for wealthy Romans added to its luster as an important city in the Roman empire.

—Abraham O. Mendoza

transport accessibility for trade. The maritime trade routes of the Hellenistic world were adopted and expanded during the Roman empire, drawing vast amounts of wealth from the Mediterranean world. The increasing dependence on foreign grain to support Roman citizens at home demanded that emperors pay attention to the defense and stability of trade routes.

Piracy in the Mediterranean

Piracy is first referred to in the legends of the Cretan King Minos. Acts of piracy feature commonly in the *Iliad* and *Odyssey*, although Homer does not specifically refer to the perpetrators as pirates.

Specific acts of piracy are difficult to determine: the Greeks and Romans did not distinguish between brigands, pirates, or privateers. An individual could be called a pirate even though his actions were no different than those of a soldier or a mercenary. According to Greek law, victims were entitled to seek redress by seizing property from their attacker. The commercial rivalries of the Greek city-states fostered piracy, and in 416 BCE, in response to Athenian attacks from Pylos, the Spartans encouraged attacks on Athenian shipping.

During the fifth century BCE the growth of Athenian naval power meant that piracy was on the wane; however, the turmoil caused by the Peloponnesian War (431–404 BCE) and the destruction of the Athenian Navy allowed a resurgence of piracy. By 380 BCE the Athenian orator Isocrates complained that the seas were infested with pirates, and in 362–361 BCE pirates ravaged the Cyclades and even raided Athens' port of Peiraeus itself.

The Hellenistic period marked the heyday of ancient piracy, with pirates being frequently employed by the successors of Alexander. The main activities of the pirates seem to have been the

Pirate ship approaches a Greek merchant vessel. Drawing of a painting on an Athenian cup located in the British Museum, late sixth century BCE. (British Museum/SSPL/The Image Works)

plundering of coastal communities and the kidnapping of men and women. An inscription from Amorgos records a night attack in which pirates were able to carry off more than 30 men and women, and an inscription from Naxos records Aetolian pirates holding 280 people for ransom. According to the Greek geographer Strabo, the most notorious pirates were Italians, Cilicians, and Cretans; the rugged terrain and lack of agricultural resources in their homelands prompted locals to turn to piracy as a source of revenue. Their numbers were swollen by refugees from the warfare and economic dislocation resulting from the collapse of the Greek states and the gradual Roman conquest. Illyrian piracy was so endemic under Queen Teuta that it prompted the Roman government to intervene in 230–228 BCE. However, Illyrian piracy continued, necessitating further campaigns in 219 BCE.

Roman efforts to suppress piracy were not entirely successful, as the republic did not maintain a permanent fleet, relying instead on allied states. Roman negligence allowed pirates from the mountains of Cilicia in southern Turkey to become more assertive following the destruction of Seleucid power at the Battle of Magnesia. To escape the attentions of the pirates, cities would either pay tribute to them or enter into alliances that allowed them harbor facilities and refuge. Although figures for the scale of piracy are scarce, Livy records that the Cretan city of Gortyn alone handed over 4,000 Roman and Italian prisoners

in 189 BCE. Cilician pirates frequented the slave market on Delos, where tens of thousands of slaves would change hands in a single day.

Although there were a few occasions when the Greek city-states were strong enough to suppress piracy (the legendary exploits of the Cretan King Minos, the Athenians in the fifth century BCE, and the Rhodians during the Hellenistic period), it was only at the end of the second century BCE that the Romans made a concerted attempt to stamp out piracy.

The earliest Roman operations against the Cilician pirates were the campaigns of Marcus Antonius in 102 BCE. Despite being granted a triumph, Antonius's campaigns seem to have had little appreciable result, and Roman campaigns continued with mixed success until the campaigns of Pompey in 67 BCE. In 74 BCE Marcus Antonius Creticus was granted a three-year command to eradicate piracy, which presages the powers given to Pompey seven years later. Pompey was granted command for three years over the entire Mediterranean and up to 50 miles (80 kilometers) inland. Although the figures for the troops at his disposal are disputed, he may have had as many as 20 legions and 270 ships. A coordinated campaign on this scale proved too much for the pirates, and Pompey was able to claim victory in three months.

Piracy continued to be a problem. Sextus Pompey was accused of having used pirates to control Sicily in 43–36 BCE, and it was only with the establishment of permanent fleets at Misenum and Ravenna in 27 BCE that the Roman government was finally able to control piracy.

Roman Road System

The principal routes of the Roman republic and empire were *viae publicae*, roads that were built at public expense for official use. Early roads were constructed to facilitate Rome's conquest of Italy: the Via Appia was built by the censor Appius Claudius Caecus in 312 BCE to link Rome with Capua and to facilitate the movement of troops during the wars against the Samnites. The road was subsequently extended south to Brundisium. The Via Flaminia was built in 220 BCE from Rome to Ariminum and extended as the Via Aemilia to Placentia in 187 BCE linking the Roman colonies of the Po Valley. The Via Postumia was built in 148–147 BCE and linked Cremona to Aquileia at the head of the Adriatic.

Main roads were used by the *cursus publicus*, or public post, that carried goods, people, and messages on official business. *Mansiones*, or inns, were provided at intervals of one day's journey, and *mutationes*, or rest stations, were provided every 10 miles (16 kilometers). During the republic maintenance of the road system fell under the jurisdiction of the Senate but was usurped in 20 BCE by the emperor Augustus, who undertook the maintenance of the roads of

▶ ROMAN MAPS

Maps did not attempt to be geographically accurate but instead attempted to aid the traveler by showing the distances between towns along the major roads. The most famous map of this kind survives as a medieval copy called the Peutinger Table that was found at Worms at the end of the fifteenth century CE. The table consists of a long scroll, 21 feet (6.4 meters) long, depicting roads elongated from east to west together with towns

and distances as well as the principal rivers and mountains. A list of *mansiones* and distances without a map survives as the Antonine Itinerary that may have been prepared at the end of the third century CE for the emperor Diocletian, although it originated in a list drawn up for the emperor Caracalla (211–217 CE).

—*Benedict Lowe*

Italy. Roads in the provinces fell under the jurisdiction of the provincial governor. Local roads (*viae rusticae*) were maintained by local town councils or by landowners for private use.

Travel by road was an arduous affair. The poet Horace describes a journey along the Via Appia to Brundisium in 37 BCE, a journey that took 13 days to cover the distance of 364 miles (586 kilometers). Recent studies have emphasized the high cost of land transport, costing perhaps as much as 20 times more than transporting by sea, and have concluded that bulk quantities of goods could not have been profitably traded overland.

The fullest account of Roman road construction comes from the poet Statius who describes the construction of the Via Domitiana linking Sinuessa to Puteoli in the later first century CE. First the line of the proposed route was marked out: surveyors or *agrimensores* would lay out the route using a *groma* that consisted of a rod surmounted by a horizontal crossbar and plumb bobs that enabled the surveyor to calculate right angles. The roadbed was then dug away to reach bedrock or a suitably firm foundation that could be achieved by beaten earth, piles, or brushwood. The trench was filled with layers of stones, gravel, and sand. The road was surfaced with paving stones held in place by a kerb and revetment. The surface was cambered to drain away water.

Roads attempted to follow as direct and straight a route as possible, requiring impressive works of engineering. In order to allow the Via Appia to follow the coastline past Terracina, a cutting was dug through the promontory of Pisco Montano that was 98 feet (30 meters) in depth. To facilitate travel from Cumae to Puteoli and Naples the emperor Augustus constructed tunnels extending for 3,280 feet (1,000 meters) at Cumae and 2,296 feet (700 meters) at Puteoli.

Rivers were crossed by bridges (*pontes*). One of the best-preserved Roman bridges is at Alcantara. Built in 105–106 CE by Caius Iulius Lacer, the bridge is 669 feet (204 meters) in length and rises to a height of 147 feet (45 meters) above the waters of the river Tagus. The emperor Trajan was also responsible for the construction of a bridge across the river Danube that is depicted on Trajan's Column in Rome and described by the historian Dio Cassius. It stood on 20 stone piers, 150

The Appian Way, an ancient Roman road, connects Capua and Rome, Italy. It was begun by the censor Appius Claudius Caecus in 312 BCE. (Paolo Cipriani)

feet (46 meters) high, 60 feet (18 meters) wide, and 170 feet (52 meters) apart.

Silk Trade in China and Central Asia

Although perhaps not the most important trade item on the Silk Roads, silk fabric and floss were nonetheless highly valued and were traded overland long before the Silk Roads became an organized trade route. Fragments of silk cloth have been found in tombs in southeastern Turkmenistan dating from the late third millennium BCE, and strands of silk were found in the hair of an Egyptian woman from 1000 BCE. Silk was also

➤ THAT DECADENT FABRIC—SILK

Silk fabric arrived in Rome in the second century BCE. The Romans were unsure about the origin of this wonderful new fabric. But whether it was manufactured from dried bark in India or harvested from trees by the Seres or Silk People of East Asia, it soon developed a flock of detractors who saw the thin, filmy material as evidence that morality in Rome was plummeting. One of the greatest critics was Seneca (4 BCE–65 CE), who said that “wretched flocks of maids labor so that the adulteress may be visible through her thin dress, so that her husband has no more acquaintance than any other outsider or foreigner with his wife’s body.” He called on Roman women to embrace the modesty that was practiced by their ancestors and to beware of appearing in public “naked hardly less obviously than if you had taken off all your clothes.” (*Epistulae morales ad Lucilium*, Seneca the Younger, 4 BCE–5 CE)

—Rebecca Wendelken

found in the fifth-century BCE tomb at Pazyryk in the Altai, in Hallstadt sites in Germany, and in Sarmatian tombs in Poland. Many of these were likely gifts from one ruler to another or tribute payments that were then redistributed to followers. During the first millennium BCE the Chinese used silk cloth to buy off the nomadic tribes and confederations that constantly threatened their borders. Silk for tribute called annual gifts were sent to nomadic peoples as protection money. In 25 BCE, 20,000 bolts of silk and 20,000 bolts of silk floss, or 10 percent of the state revenues for that year, were sent as tribute to the Xiongnu. Between the first and fifth centuries CE cloud- and animal-patterned textiles found their way to Mongolia and Russia and eastward to Syria and beyond, where their designs influenced the wool weaving in the west. It is also important to remember that silk was used as a medium of exchange, in some places taking the place of coins.

In China during the Zhou dynasty (1050–221 BCE) silk production became the work of women, and new weaves were developed. During the Qin (221–206 BCE) and Han (206 BCE–220 CE) dynasties the Chinese government set

up workshops to provide high-quality fabrics for imperial use, and Chinese technical expertise grew. Great advances were also made in dyeing and finishing fabrics. There was also a switch from warp-based to weft-based patterning, an innovation introduced to China from central Asia. This illustrates the contact between weavers in the two regions.

While we know that silk moved through central Asia, its provenance is often difficult to ascertain. Silks from China do not bear their maker’s marks, although those found in Buddhist settings often have the names of donors. Silk production outside of China lacks conclusive evidence for identification and could be woven from Chinese silk floss, further complicating the identification of where they were woven.

There is evidence that Chinese weavers took the tastes of foreign consumers into consideration, since Han textiles found in northwestern China differ greatly from those of the same period excavated at Mawangdui. The textiles from the northwest often contain animal motifs, rarely seen in textiles from Mawangdui. But the first real evidence of the transfer of motifs takes place during the Northern and Southern dynasties (420–588 CE) when the Sassanid Persian pearl-edged medallion began to be used in China.

Outside China proper, Xinjiang is believed to be the first area to practice sericulture. From there silk production spread slowly through central Asia, becoming especially important in Sassanid Persia. In response, Chinese weavers began to design forms and patterns that were attractive to their central Asian markets to compete with locally produced fabrics and to meet the market at home that had developed a taste for central Asian forms and motifs.

Development of Formal Market Centers in Mesoamerica—Pochteca

In Mesoamerica, formal market centers emerged in the Formative period, while professional merchants became common in the following Classical period (100–900 CE). Mesoamerican markets and merchants were both stimulated and stymied by the lack of domesticated transport animals, making the wheel unimportant and emphasizing human foot traffic using tumplines and backpacks. Few navigable rivers and wet dry seasons also restricted watercraft traffic primarily to coastal canoes.

Mesoamerica was a region of Stone Age technology societies, and resources such as stone (chert and obsidian for tools and ritual items), limestone (cooking and building surfaces), salt (cooking and preservation), wood (cooking, heating, construction, and tools), cotton (clothing, rope, and bedding), and ceramics (storage, cooking, and ritual items) as well as basic foodstuffs were necessary to village, town, and farm hamlet survival by the Formative period. Since all of these goods were rarely available in one local region, regional trade through formal markets and market days emerged. The Olmec followed by Monte Alban were the first to formalize trade over distance in Mesoamerica during the last millennium BCE. Olmec traders appear to have carried a variety of raw and finished items across regions including obsidian blades and cooking vessels of stone and clay and perhaps even spread the tortilla or flatbread so ubiquitous with the region today. They may even have moved goods by canoe, indicated by a sunken watercraft with a large Olmec stone head in the Usumacinta River.

Elite goods of rare, exotic, and ritually favored qualities also moved along these emerging trade networks. Professional merchants later known as Pochteca in Aztec Nahuatl probably emerged with this trade that moved slaves, cacao beans, turquoise, jade, quetzal feathers, rubber balls, iron ore mirrors, seashells, and more.

➤ CACAO BEANS AS A MEDIUM OF EXCHANGE—CHOCOLATE AND MONEY

Cacao beans are used to produce the Mesoamerican drink of the gods, bitter chocolate. In Mesoamerica cacao also doubled as a medium of exchange or money. Since it had value both as a ritual item and as a foodstuff, it was used to negotiate the finer details of a trading price. In historic times, the annual labor of a peasant was worth between 2,000 and 6,000 cacao beans, and a turkey could be had for 300 beans. Prices varied with market conditions, but cacao was traded alongside Spanish silver coins well into the sixteenth century.

—Christopher Howell

These merchants were either sponsored by or were members of elite lineages from Olmec chiefdoms. By the rise of Monte Alban (500 BCE) in the Mixtec and Zapotec homelands, trade had become important enough that entire settlements and chiefdoms were organized to control the regional economy.

In the following Classical period state-level civilizations had emerged throughout Mesoamerica, and trade was an essential local element, with formal markets and a desired interregional element of elite goods moved by professional traders. Teotihuacan and the emerging Maya city-states provide the best-known examples. Teotihuacan specialized in the mass production and distribution of household goods such as effigy ceramics and obsidian materials. Maya city-states like Tikal were major consumers of finished obsidian for ritual and status purposes.

In the first millennium CE signs of mature markets and international trade were evident in Mesoamerica. Metals and metallurgy moved up from the west coast of South America, especially copper tweezers, bells, and body ornaments followed by silver and gold metallurgy. Maya canoes were moving goods like salt along the Caribbean coasts of Mesoamerica. Turquoise, shells, and ceramics were moving along the so-called Turquoise Road to and from southwestern North America. Most importantly, ideas, beliefs, power, and people became associated with the established trade

routes and products, helping to create the core civilization zone of Mesoamerica.

■ Introduction: Types of Labor Forces

The organization of labor varied significantly throughout the world from 1000 BCE to 300 CE. In much of the Near East at this time, labor forces consisted of corvée laborers, laborers who worked for the state as a means of paying their taxes. This had long been a common form of tax paying. In the absence of currency, states often preferred to have people perform military, industrial, or construction services rather than extracting resources (such as agricultural goods that eventually spoil) from the commoners. Slave labor had also been common throughout the Near East, and this practice came to be common in the Greek and Roman worlds. Specialized labor increased during this period as well; this is labor in which people learned certain trades or skills and were hired (or compelled) to perform these services in exchange for money or subsistence products. Specialized work became incredibly common in Greek and Roman cities and in fact seems to have become a major marker of identity in these cultures (people started thinking of themselves as carpenters, for example). The following entries demonstrate some of the most important labor patterns throughout the world (beyond subsistence practices) from 1000 BCE to 300 CE.

—Kevin M. McGeough

Development of Specialized Labor in the Greek Polis

Although agriculture demanded the largest percentage of workers throughout antiquity, the specialization of labor occurred very early in the development of the polis (Greek city-state). Both

Homer and Hesiod refer to a wide variety of occupations. In the seventh and sixth centuries BCE, craftsmen and their workshops were associated chiefly with the great Panhellenic sanctuaries they constructed. As craftsmen became more diverse, the number and variety of technical subspecialties increased, and workshops began to proliferate in the *poleis*. The early polis became the nexus for the exchange of commodities, which created an intrapolis commercial network and also fostering trade with other poleis and the outside world.

The growth of new markets contributed to further specialization of labor, as can best be seen in the case of Athens. The opening up of lucrative new markets during the heyday of the Athenian empire in the fifth century BCE led directly to Athens' dominant role in technological innovation. This was fostered by Pericles' policies, which lured skilled craftsmen from all over the Greek world to Athens.

In the *Republic* (369e–372d), Plato identified five large categories of industry necessary for the polis to operate efficiently: production (both agricultural and industrial), trade, transport, retail, and manual labor. While simplistic, Plato's list encompassed most of the occupations present in Classical Greece.

Although the elite relied upon the manufacture and exchange of goods by specialized craftsmen to maintain their lifestyles, they continued to believe that the only respectable occupation was that of landed property owner. They accordingly held artisanal (*banausic*) activity in contempt, particularly when it involved manual labor. This attitude arose from the association of manual labor with slaves, freedmen, or resident

➤ XENOPHON'S SOCRATES REFLECTS THE CONTEMPT OF THE ELITE FOR BANAUSIC LABOR

“‘Well said, Kritoboulos,’ replied Socrates, ‘For the trades of artisans as they are called are decried and are understandably held in contempt in our cities, for they disfigure the bodies of those who work at them and supervise them, compelling them to remain seated and stay within doors, and sometimes to spend all day at the fire. When bodies become enervated, the souls become much more sickly. And moreover these artisans’ trades as they are called leave no free time for attending to one’s friends and the city, with the result that such men appear to be inadequate both in their relationships with friends and as defenders of their coun-

tries. And in some cities, and especially those which have a warlike reputation it is not permissible for any of the citizens to work at the trades of artisans.’”

Specialized Labor in the Roman City

Romans who were not farmers and who were not in the army mostly lived in cities, and, for them, there was a variety of ways to earn a living. The upper-class Romans who wrote all the surviving sources had very definite ideas about work and employment. For them, how you earned an income had strong moral overtones. In fact, they believed that most forms of employment were degrading and that truly civilized

people should not work at all. This is quite an extreme way of viewing employment, since nearly everything we would consider a form of work today was considered to be morally degrading by aristocratic Romans. Earning a salary, buying or selling goods, manufacturing goods—all of these activities were considered vulgar, and a true aristocrat could not dirty himself with them. Thus, to the upper-class Romans, only those people who were so rich that they did not have to do anything to earn a living were considered fully human and civilized.

The things that aristocrats did that we would consider to be jobs, like serving as a lawyer or being elected to a magistracy such as a praetorship or consulship, were not considered jobs because their practitioners received no pay. Politics and the law were truly the preserve of rich men since these fields entailed spending a lot of money but did not grant any in return. In keeping with the republican ideology of virtue exemplified by Cincinnatus, the only profession that did not degrade someone was farming. Rich men were expected to acquire and maintain their wealth primarily by owning land. By the empire, aristocrats did not do any real farming themselves, however, and in fact spent almost all their time in Rome rather than on their estates. They lived off the labor of hundreds or thousands of slaves who did the actual farming on their estates. The sources are full of expressions of contempt for anyone who made a living

➤ BUYING LOCALLY

The overwhelming majority of foodstuffs grown, and goods manufactured, in the Roman world was consumed or utilized very close to its site of production. Most items were sold by the growers or manufacturers themselves in their own neighborhoods or villages. The local marketplace was the center for most trade and transactions, and whatever goods were available regionally formed the entirety of most people's economic world. While small regional markets did a lively trade in local commodities, true long-distance trade was a daunting proposition. Moving anything in large quantities overland was both expensive and hazardous. Bulky cargo could be transported more easily by water, and it is no coincidence that most major cities grew up along coasts or on navigable rivers. However, seafaring technology was rudimentary, there was no effective way to predict storms at sea, and piracy was rampant, so there had to be either very strong motivations or very high profit margins to justify shipping goods across the sea. Despite these hazards, one of the most lucrative businesses in which one could make fantastic profits was the long-distance trade of luxury goods by ship. A single shipload of spices, fabrics, or dyes from the East could make one a millionaire overnight. However, building a merchant ship and buying its cargo required substantial capital up front, and it was an extremely risky investment.

—Gregory S. Aldrete

by working or through commerce. This was the Romans' ideology, but in reality, the picture was more complex. Many rich Romans gained and maintained their fortunes through means other than farming. Some were moneylenders who charged up to 60 percent annual interest on a loan. Some were in essence factory owners who had shops that produced goods such as lamps, bricks for building, and plates and containers made out of clay.

A few aristocrats got very creative in the ways they amassed wealth. The best example of this was a man named Crassus, who lived during the late Republic. Crassus became the richest

man in Rome at least partially through an original and clever strategy. He prowled the streets of Rome at night, accompanied by a huge band of his slaves carrying buckets and axes. As soon as one of the frequent fires broke out, Crassus and his slaves would rush to the spot, and Crassus would offer to buy the burning building from its owner. He would usually offer between one-quarter and one-third of its real value. The poor owner, faced with the choice of one-quarter of the value or losing everything when it burned down, usually sold it to Crassus. As soon as the document was signed, Crassus would order his well-trained gang of fire-fighting slaves into action, and they would put out the fire. In this way, Crassus ended up owning much of Rome, which he acquired literally at fire sale prices.

While the upper classes could afford to be choosy about employment, the vast majority of people in cities had to work. The working classes can be divided into two basic groups: those whose profession required some sort of training, talent, skill, or capital and those who were unskilled and sold their labor for wages. One of the ironies of Rome is that most poor citizens fell into the second category, that of the unskilled wage laborer. The skilled workers were often slaves and ex-slaves. In inscriptions on tombstones, about two-thirds of those who identify themselves as some sort of skilled worker are freedmen. Over 200 different jobs are mentioned on tombstones from the city of Rome. Many of these professions listed were specialty jobs manufacturing luxury items, such as the *plumarii*, who apparently made a living doing embroidery exclusively using feathers, or the *fabri ocularii*, whose full-time employment was to manufacture the eyes for statues. There were six or seven different makers of footwear, including those who made only boots, those who made only women's shoes, and those who only wove sandals. Another large category was people who provided specialized services to the rich. Among these was one full-time job consisting of memorizing the names of a patron's clients. Perhaps one of the most unappealing service specialties belonged to the *alipilus*, whose job was to pluck out underarm hair.

Although aristocrats regarded work and moneymaking with scorn, many freedmen seem to have taken great pride in their work. This can be seen most clearly on their tombstones, which often featured a sculptural relief showing the deceased practicing whatever profession he or she had followed. Even if they lacked a picture, tombstones would often include symbols that indicated the job the owner had held. For example, a butcher might have a selection of knives and cleavers on his tombstone. Sometimes, freedmen got quite creative with their funeral monuments. One man named Eurysaces, who owned a shop that baked bread, had his tomb carved into the shape of a giant bread oven, onto the sides of which were carved pictures of the baker overseeing his workers grinding grain, kneading dough, and cooking it. Another famous tomb belongs to a man who owned a construction company, and his monument mostly consists of a carving of a building crane used to erect structures. This pride in work can also be seen in the decoration found in the homes of some of these people: one worker at Pompeii had set into the floor of his house the phrase "Profit is happiness."

In addition to tombstones, another way that we know about Roman jobs is that all the people who practiced the same profession formed professional associations. These trade associations were called *collegia*, and often the members of such a group would put up a monument commemorating their accomplishments. The *collegia* also seemed to play a role in politics, and much of the graffiti on Roman walls consists of *collegia* urging other people to vote for a certain politician.

Many Romans owned small shops where they sold goods. One common type of small business was the *popinae*, which was a Roman combination of bar and fast food restaurant. These were housed in small rooms usually located at the intersections of major streets. Across the front was a counter with two or three large clay pots set into it. Underneath the pots were places where small fires could be built to keep the pots warm. These pots probably contained an assortment of gruel, fish stew, and *garum*, and pedestrians passing by who felt hungry

could purchase a ladleful of whatever fast food they wanted.

The lowest form of employment was unskilled workers who had nothing to offer except their labor. They hired themselves out for a salary to perform various menial jobs. Such wage labor was considered the most degrading sort because the Romans thought that it was the equivalent of becoming someone's slave. These wage laborers were called *mercenarii*, which is the root of our word *mercenary*. Today, wage labor is usually calculated on an hourly basis, but in ancient Rome, the standard unit of labor for a *mercenarius* was one day's work. A day's worth of work was known as an *operae*, and contracts would specify a certain number of days of labor that the *mercenarius* was selling to his employer. The most common type of day-labor job was simply to carry things around. A sizeable percentage of the free inhabitants of Rome would have found employment in two fields: the supply of food and other commodities to Rome and the construction industry. Especially during the early empire, the emperors built lavishly, and these projects would have employed thousands of people merely to dig the foundations and carry away the dirt. A single construction project of the emperor Claudius employed 30,000 men for 11 years as diggers.

Slave Labor in the Ancient Greek and Roman Societies

Slavery in antiquity was a vital institution in terms of establishing both a viable labor pool and the structure of social organization in the Mediterranean. Both ancient Greek and Roman civilizations held slavery as a fundamental component to the functioning of their societies. Greek slaves functioned at the bottom of Greek society, handling the quotidian functions of households, agriculture, and other jobs that Greek citizens found undesirable. Roman society also valued slaves as an integral component of their labor force, particularly in *latifundia* (large-scale agriculture), as gladiators, and as tutors (particularly Greek slaves) for their children. Typically prisoners of war or debtors, slaves constituted a significant portion of the population of classical societies (particularly in Sparta and Rome under the Principate). However, in spite of being at the lowest end of the social ladder, many slaves had a significant amount of agency within these societies,

and small numbers of them were able to gain their freedom and some level of access to social mobility.

Slaves in ancient Greece were typically conquered populations from neighboring regions. After major military engagements, women and children from subdued populations were taken into slavery after the men who constituted the bulk of the enemy forces were killed off. This process occurred from early in the Mycenaean period well up to the Hellenistic period. Therefore, times of warfare were directly associated with the infusion of slaves for a victorious Greek city-state or kingdom. Greek societies preferred non-Greeks as slaves, typically people from Anatolia, Scythia, and Thrace. Slaves from these regions were valued for their functions. For example, Scythians were considered to be good policemen, as they were known to be skilled archers. Moreover, foreign slaves of many ethnic groups were seen by Greeks as being less likely to revolt or escape, as they would feel less familiar with Greek culture and language, thereby inhibiting communication. However, the case of the Spartans and their subject population of helots proves that this was not always the case, given that Spartan society and its characteristic militarization was created from fears of a major slave revolt, which were not uncommon.

In spite of their subordinate position, some Greek slaves did enjoy some level of rights and social mobility. Slaves were given some rights under the law and were able to buy their freedom or attain manumission from their owner. Household slaves who gained their master's trust and affections were able to gain their freedom upon their master's death. At times, wills would grant land and other forms of wealth to favored slaves in addition to their freedom. Moreover, manumitted slaves were able to graft themselves as members of Greek society in some instances, sometimes even as citizens of the polis. Nonetheless, more often than not slaves and their children remained at the lowest rung of Greek society and had few rights and protections.

Roman slaves, much like those of ancient Greece, also consisted of prisoners of war and subdued populations from defeated enemy states. However, debtors, kidnapped foreigners, criminals, and unwanted children could also be

► CLASSICAL SLAVERY AND THE DECLINE OF THE ROMAN REPUBLIC

Slavery constituted a significant factor in the decline of the Roman republic in that it provided a large labor force for Roman aristocrats, at the expense of the small yeoman farmer. The yeoman farmer, who was considered the backbone of the Roman republic and constituted the soldier-citizen of the Roman legions, could not compete with the growing wealth of the Roman *latifundia*. Thus, in the late republic in the first century BCE, these farmers could either join the growing urban masses or join the Roman legions as professional soldiers, beholden to their generals for booty and wealth. As these generals (such as Marius, Sulla, and Julius Caesar) could promise land and wealth for their soldiers, they were more than ready to usurp the power of the republic and set themselves up as dictators. With the establishment of the Principate under Augustus (formerly Octavian), the pretense of the republic continued, while the reality was that power was retained by a military general.

—Abraham O. Mendoza

forced into slavery. Roman slaves could be bought and rented from slave traders, who hawked their goods through auctions. Slave labor in Rome ranged from forced employment in mining, construction, and agriculture to the relatively more comfortable roles involved in the administration of a Roman household. Some slaves were craftsmen; they worked in relative autonomy and were able to keep their own wages. However, slaves were expensive, due to associated costs, and were considered more of a status symbol for wealthy Romans (or even well-to-do Romans) than anything else, given that it was cheaper to hire laborers.

Slaves in Roman society were considered to be at the bottom of the social structure and thus had few rights and protections. However, they were granted some level of agency depending on the master's favor. The lot of the vast bulk of slaves was in doing the work that Romans did not want to do, but there were exceptions. Household slaves who held their master's favor were able to hold significant power amid the

running of large agricultural estates (*latifundia*) or business firms. They were also able to attain or buy their freedom through the granting of their manumission at the death of their owner. The most famous of slaves, the gladiators, attained glory and fame in Roman societies and were a key component in Roman entertainment. Slave revolts, such as the famous revolt led by Spartacus (73–71 BCE), were a grave threat to Roman society given the large numbers of slaves throughout the empire. Therefore, the punishment of slaves was key in preventing and deterring any potential for stirring a large rebellion.

■ Introduction: Art and Economy

Visitors to museums that display Greek antiquities are often overwhelmed by the sheer volume of painted ceramics. Vases with elaborate decoration and beautiful images are treated as pieces of art in modern museum contexts. Yet the initial production of these extremely fine ceramics was spurred on for commercial purposes. The art was not art for art's sake but art for profit. Similarly, the elaborate Roman sculptures that fill museums today were produced for monetary gain by the artist, whether through payment from a wealthy patron or as statues commissioned and purchased on one occasion by a particular buyer. The commercial motivations of artistic enterprises are less apparent in other situations, but undoubtedly there were two fundamental commercial motivations that surrounded artistic production beyond the value of the raw resources from which the art was produced. For the artist, artis-

tic production was a specialized skill that allowed the artist to make a living. For the commissioner of the art (whether they were a private individual or a state body), the piece of art was an investment in status and standing within the community, a means of displaying wealth or communicating certain messages about the possessor to the rest of the society.

Vase Painting in Athens and Corinth

By the seventh century BCE, the Greek city of Corinth possessed one of the most powerful trade empires in the Mediterranean. The city was ideally situated near the narrow Isthmus of Corinth with access to sea routes both east and west. Seventh-century BCE Corinth was

➤ IMAGE OF THE FRANÇOIS VASE

Many of the best-preserved Athenian black- and red-figure vases were found in Italy. The Etruscans, the ancient people of what is the present-day region of Tuscany, imported large amounts of decorated Greek pottery and interred it with their dead. The so-called François Vase, named for the man who discovered it, was crafted in Athens around 570 BCE and was exported to the Etruscan city of Vulci. The vessel is a krater, or mixing bowl for wine and water. The François Vase was signed by its painter, Kleitias, and bears labeled images of many gods and heroes from Greek myth who are all labeled by name. The names of the figures may have been written on the vase because the painter was aware that in a foreign land the buyers may not have been familiar with Greek stories.

controlled by a powerful dynasty of tyrants (similar to dictators) who reigned in an era of increasing interest in overseas trade and settlement. Two of the most important products of the city were perfumed oil and wine. Corinthian potters developed a distinctive pottery painting style for perfume bottles and wine wares that was based on Near Eastern metalwork, with dark painted silhouette figures on a light background and incised detail lines. This pottery painting technique is known as Black Figure or miniature style. The favored motifs were animals, both real and mythological, and small filler shapes such as rosettes. Corinthian-style pottery was exported to all parts of the Mediterranean via an extensive network of trade colonies, such as Epidamnus and Corcyra, to the northwest of Greece and Syracuse in Sicily. These helped to ensure a wide distribution for the products of the mother city.

In the sixth and fifth centuries BCE, the Mediterranean market for luxury wine wares was dominated by Athens at a time when the city was greatly expanding its own overseas trade interests. Expanding on the manufacturing

style of Corinthian pottery, Athenian potters were able to produce a more impressive product in the Black Figure technique. The region of Athens possessed high-quality clay with a high iron content. When fired, shiny black figures on a brilliant orange background mimics gold and silver wares (silver tarnishes to black); this type of pottery is referred to as Black Figure ware. Athens' potters tended to represent mythological scenes on their vases. Images on the wares were taken particularly from tales of war, love, and of course wine.

Around 530 BCE, some Athenian potters began to experiment with a technique whereby the background of the vase was painted black while the figures were left orange and had painted detail lines. This technique, known as Red Figure, eventually became the typical fine ware produced in Athenian pottery workshops. Red Figure allowed artists greater freedom to experiment with painting techniques such as shadow and perspective that were not easy to achieve in the silhouette shapes of Black Figure. The themes represented on Red Figure vases

were initially similar to those from the Athenian Black Figure vessels. However, painters showed increasing interest in scenes from daily life, particularly the *symposion* (symposium). The symposion, an all-male gathering for feasting, wine drinking, and discussion, was one of the most important Greek cultural institutions and was adopted by many cultures in contact with the Greeks. Athenian wine wares were desirable imports not just in Greek cities but also in many non-Greek regions. This phenomenon intensified with the rise of the Athenian empire in the fifth century BCE, particularly in the Athenian-controlled cities in the region of the Black Sea for which a Red Figure style with gilded details was developed. In the Greek cities of southern Italy and Sicily, imitation wares were developed to meet high local demand for Athenian symposion vessels.

Roman Sculpture Industry

Roman stone sculpture tended to be produced in workshops. These workshops consisted of master sculptors and of apprentices at different stages of training. The sculptor's profession, like many crafts in the ancient world, appears to have been passed down through family lines. Stoneworking tended to be a particularly conservative craft because of the limitations of the material, so in order to ensure successful results, apprentices reproduced the techniques and styles of their masters quite closely. What evidence we have suggests that workshops tended to specialize in particular genres of sculpture so that artisans who produced figures of gods and humans probably did not produce sarcophagi (carved stone coffins), and vice versa.

In the late Republic (first century BCE) Roman patrons often commissioned Greek sculp-

THE SARCOPHAGUS TRADE

Sarcophagi first became fashionable in the second century CE, and many (though not all) were mass-produced. This meant that they (or parts of them) could be roughed out at the quarry and finished, or nearly so, in the workshop before a buyer was ever found. We have examples of sarcophagus lids that were abandoned in the quarry and of sarcophagi that were complete except for the portrait of the deceased, which was merely roughed out and awaiting completion when the identity of the deceased became known.

—Ellen Perry

tors, who signed their names to their works. There were simultaneously, however, Italian sculptors working in a vernacular tradition that clearly identified them as Italians. This tradition, which is most easily seen in the funerary reliefs of the time but which can also be found on major state monuments such as the Altar of Peace, includes a marked preference for particular tools and techniques. For example, Italian sculptors of the first century BCE tended not to smooth away tool marks from the flesh of their figures. They would finish their work with a curved or flat chisel, whereas a Greek sculptor might go on to use a rasp and even an abrasive such as emery in order to remove any tool marks. The Italian sculptors may have avoided such finishing because they trained with local stones such as travertine and tufa, which were coarser than Greek marble and therefore took detail and polish less readily.

What made a sculpture Roman necessarily changed when Rome became an empire and workshops from around the Mediterranean began to produce commissions for Roman patrons. Some of our best evidence for sculptural production from the first through fourth centuries CE came from the city of Aphrodisias in Turkey, where excavators discovered a sculptor's workshop (apparently destroyed in the fourth century CE) that contained unfinished statues. Aphrodisias has also produced a number of apprentices' trial pieces. From the unfinished statues, we learn that Roman figures tended to be carved from front to back and that sculptors

relied on a keen eye more often than on measuring devices. From the trial pieces, we learn that Aphrodisian apprentices were, at least occasionally, tested on their ability to produce isolated body parts, such as feet or hands.

Elite Craft Art in Mesoamerica

Elite craft art in early Mesoamerica developed in a variety of media. Various artifacts have come to light thanks to archaeological excavations. Carved reliefs and mural painting of ancient cit-

ies often depict Olmec, Maya, and Teotihuacan leaders in sumptuous and complex attires. Historical information can only be gathered from early Classic Maya monuments, mostly stelae (upright carved slabs), that bear inscriptions related to the personages portrayed and their deeds and qualities. From these sources of evidence, archaeologists and art historians have been able to reconstruct the kinds of art that ancient Mesoamericans used to signal their eliteness.

The oldest and most important luxury item in Mesoamerica is jade. While pure jade is a rare item, any greenstone could be worked into a luxury artifact and bear the same symbolic meaning. Jade stones were exchanged as raw pieces or beads or were carved in elaborate ways. Most important among the Olmec, the first civilization in Mesoamerica to develop a recognizable style and iconography on stone, greenstone objects could vary in size from small portable pieces to heavy monumental objects. So-called Olmec celts, for example, come in the shape of a maize god or ear of corn. They were deposited in large caches, offered to people who had served important roles in their lifetime. Dignitaries had masks carved for them to be placed on their tombs. Most of these pieces are effigy masks (i.e., small replicas of actual masks) and could not be worn. Rather, they functioned as tokens of the transformative possibilities of the ruler, with each mask symbolizing a different divine impersonation.

Body adornments of jade or conch ear spools and necklaces are part of the iconography of rulership as evidenced in Olmec sculpture, where personages firmly carrying a staff with both hands on a transversal position are shown in sumptuous attires. So-called mirrors were often carried on the back. Made of a variety of materials from obsidian to iron ore, these were not glass mirrors but rather polished concave surfaces whose reflective qualities were associated with the shamanic vision, or the ability of a priest to look into the past (i.e., communicate with the ancestors) and the future. Although they were not used to light fire, the concave surface refers to a possible function as incense burners, which were typical instruments of the shaman's vision quest.

The Maya of the southern lowlands of Mexico and Guatemala continued the traditions of

▶ ELITE SYMBOLISM

The symbolic construction of an elite status in ancient Mesoamerica passed through the successful completion of certain rituals. During public ceremonies, fertility rituals (for the propitiation of rain and good harvests) were performed that involved the display of exotic and finely crafted objects. Jade was widely employed in this context because its green color was also associated with the young maize plant. Royal masks typically include a foliated headband, another clear indication that political authority heavily rested on the manipulation of agricultural symbolism. Many elite art objects were found in tombs, where they continued their propitiatory function of regenerating life after the death of the ruler.

—Alessia Frassani

small and fine carvings, borrowing directly from their Olmec ancestors. Olmec jades were reused, and Mayan inscriptions were added to testify to their new ownership (the name of an elite or his/her dynastic record). Body ornaments, such as earrings, pendants, necklaces, and even teeth adornments made of jade and shell, symbolized the privileged position of elites (including priests and political leaders) in their intermediary role between the human and supernatural realms.

Other important elite items are feathers, obtained from rare tropical birds such as quetzals and macaws. Quetzals give only two long emerald green feathers (from the tail), while macaws give bright red, blue, and yellow feathers. Although no feather headdress survived from early Mesoamerica, frequent depictions of rulers in full royal attire (such as in painted reliefs) show extremely elaborate head decorations, consistent with information that was later provided by the Spanish at the time of the conquest (1520s).

Development of Elite Craft Art among the People of the Andean Region

High-ranking people in the ancient Andes devised several ways to express and assert authority over their subjects. Archaeological excavations have revealed incredibly rich tombs in different places in the Andean region. Gold, silver, and

DEVELOPMENT OF ANDEAN METALLURGY

Since the Early Horizon (1050–650 BCE), complex alloys to smelt copper, gold, and silver were produced in the northern Andes, where the site of Sipan is located. The close interaction with people from coastal Ecuador and the Columbian Highlands, where the precious metalworking also developed early, may have played a role. A peculiarity of Andean metallurgy is the use of alloys that appear as pure silver or gold on the surface. Through a process known as depletion gilding, a combination of copper and gold was chemically treated to dissolve the copper on the surface and let the gold shine through.

—Alessia Frassani

copper artifacts, together with elaborate embroidered textiles, bespeak of a complex system of production, exchange, and consumption of luxury goods. However, in the absence of any historical information, it is rather difficult to elaborate on the significance of the elite status ascribed to these luxury artifacts. What type of privilege, for example, did members of the elite enjoy? The nature of political leadership, religious powers, or systems of economic dependency is rather difficult to assess with the data currently available to archaeologists. Also, almost all elite art objects were retrieved in tombs (where they were preserved through the centuries, protected from the elements), and much less is known about their original context of use (outside of a funerary setting).

The earliest form of status display is found in the necropolis of Paracas (650–200 BCE), a vast burial site on the southern coast of Peru. More than 400 mummies were found inside underground chambers, where they filled up entire rooms. Hundreds of feet of elaborate embroidered textiles were wrapped and sewn around the bodies, creating larger-than-life bundles. While some textiles show signs of wear, others appear to be brand new and were most likely produced to be directly worn by the dead. Only a few bundles have been unwrapped, all of which carried a staff, a symbol of authority. The textile decorations consist of serial patterns,

mostly depicting animals and plants. The animals and plants depicted are not those commonly found in the surrounding region, nor were they a part of common consumption. On the other hand, exotic plants, such as beans, and animals, such as pampas cats, llamas, and condors, are present. They all inhabited the Andean highlands, hundreds of miles away from the coastal and desert plains of Paracas. The exclusive depiction of exotic goods in the textiles may parallel economic privileges over their exchange and consumption among elite members of Paracas society.

In the Moche site of Sipán on the northern Peruvian coast, three tombs were excavated in the late 1980s inside a large platform pyramid. The deceased were adorned with an astonishing amount of metal jewels, including gold and silver round ingots measuring 2 inches (5 centimeters) in diameter and 0.5 inches (1.3 centimeters) thick, decorated standards, pectorals, nose ornaments, effigy earrings, necklaces, rattles, head-dresses, and scepters. In one tomb, the face of the deceased was covered with several gilded sheets in the shape of the mouth, teeth, nose, and eyes. His blouse and sandals were also made of precious metal. The most striking feature in the profuse use of metal in these royal tombs is

the combination and meaning assigned to gold, gold plating, silver, and copper. Gold and silver are associated with male-female duality in the Andean world. The universe was conceived as divided in two parts: the right side was masculine and golden, while the left side was female and silvery.

War and Diplomacy

“All warfare is based on deception”

—Sun Tzu, *The Art of War*

The *Art of War* by Sun Tzu is one of the oldest treatises on military strategy and tactics that survives to the present day. Living during a period of military conflict within China, Sun Tzu compiled his insight about combat into what has come to be thought of as a masterpiece of military writing. The book is divided into 13 sections, each detailing a different aspect of military planning, tactics, or description of common combat situations. Within the work, Sun Tzu argues that tactics is not merely an approach to planning out combat before it occurs but being able to foresee and respond to different situations as they occur. In its ancient context the book was simply titled *Sun Tzu* after the honorific title used as the author's name. It has come to be called *The Art of War* and continues to be inspirational to military leaders in current times, and in the 1980s it was recontextualized as a motivational guide for the business world.

While the period 1000 BCE to 300 CE was not likely the first era in which military tactics were conceived, this is a period in which the diversity and complexity of tactics increases. Prior to 1000 BCE, military campaigns took on three major forms: naval battles, free-for-all meetings of armies on fields, and city sieges. While these three arenas of combat remained the main loci of battles from 1000 BCE to 300 CE, the type of combat that went on in these arenas became significantly more varied.

The Neo-Assyrian military adopted powerful siege weapons and techniques and utilized siege warfare as a means of bringing the cities of Israel and Judah under its suzerainty. The siege weapons they used were designed as a means of destroying powerful city walls and encircling cities so as to cut them off from supplies. The Romans further mastered the art of siege warfare, and the massive Roman siege ramp at the site of Masada is still present (allowing tour buses to drive up to the top of the site to this day). Fortifications in Mesoamerican cities indicate that city sieges were a feature of life in the Americas as well. The site of Becán in the Río Bec region of the southern Maya lowlands had a system of fortifications that surrounded about 19 acres (8 hectares) of the city. A 1.2-mile-long (2 kilometer) ditch and parapet system created a 33-foot-high (10 meter) vertical barrier, which would have severely disadvantaged invaders.

Advances in projectile technology between 1000 BCE and 300 CE were directly incorporated into military technology. The Greek trebuchet was a type of siege weapon that worked on the principle of leverage. This device was capable of propelling stones farther and more accurately than a catapult and was used to smash walls or cause damage

behind walls. The development of the crossbow was a development of projectile technology on a smaller scale. A crossbow consists of a bow mounted on a stock and shoots bolts. The crossbow was used throughout the Greco-Roman world, and during this period the Chinese also made significant advances in this technology. One of the most noteworthy was the repeating crossbow, which allowed the crossbow to be loaded and fired with one hand, greatly increasing the speed of its use.

Tactics on the field shifted from 1000 BCE to 300 CE. New strategies and equipment would force armies to come up with new approaches. The city-states of the Greek world relied primarily on heavy

Hoplites fought together in a phalanx position, each one protecting the soldier on his left with a shield. Presuming that no one broke rank, the hoplite phalanx could move forward and attack the enemy army as a unified mass.

infantry in their skirmishes. The most noteworthy type of Greek heavy infantry was the hoplite, an armored soldier who held a shield and spear. Hoplites fought together in a phalanx position, each one protecting the soldier on his left with a shield. Presuming that no one broke rank, the hoplite phalanx could move forward and attack the enemy army as a unified mass. The Macedonian Army brought further innovations to combat on the field

through the use of longer spears and the integration of cavalry.

The development of cavalry was one of the most significant innovations in combat between 1000 BCE and 300 CE. Soldiers mounted on horseback had certain tactical advantages: speed, mobility, height, and inertia. The earliest cavalry seem to have come from central Asia, where the horse-mounted steppe warriors pioneered horse-based warfare. From central Asia, horse-based warfare techniques spread to East Asia, South Asia, the Near East, and the Greco-Roman world. Neo-Assyrian reliefs depict men riding bareback on horses and shooting arrows at enemies. The development of the recurve bow, which was shorter than a typical bow with tips that curve away from the archer, facilitated horseback archery, as larger bows were cumbersome to handle while riding.

Naval warfare also developed from 1000 BCE to 300 CE. Naval combat appears for the first time in China during the Warring States period (481 BCE–221 BCE). Combat on water had already been a feature of life in the Mediterranean for centuries. The Persian Wars between Greece and Persia were the first wars (at least the first known wars), though, to feature large-scale naval combat as well as integrated land and sea battles. The Romans, while not initially a naval power (since the city of Rome is located inland), developed a navy and naval strategies during the Punic Wars with Carthage. The most noteworthy Roman development was the *corvus*, a tool that allowed Roman ships to grapple enemy ships and board them.

The period from 1000 BCE to 300 CE also saw the development of the first standing armies. Whereas armies in the Greek world were composed of soldiers who acted as soldiers only in certain seasons, the Romans built armies out of professional soldiers who worked as soldiers for much of the year. It was possible for a Roman man to build a career within the military. Although soldiers were encouraged to have other skills and to be trained in a trade, it was possible to spend an entire ca-

reer in the military. In China, large standing armies were made possible by the development of mass-produced iron weapons, which allowed states to draft nonspecialists as soldiers. Warfare in China was no longer solely an aristocratic venture.

Similarly, veterans came to be a recognized group in the Roman world. Roman veterans gained certain rights, statuses, and economic privileges at the end of their terms of service. They became an important force in Roman society. This is a dramatic transformation in the manner in which soldiers were thought of by the state. It was a new recognition that the state had an obligation to those who fought on its behalf. Prior to this, in much of the Classical and Near Eastern world, military service had been thought of as an obligation owed by individuals to their state (akin to taxes) and not something worthy of reward or notice.

The period from 1000 BCE to 300 CE is also a period of great military leaders. Arguably the most successful military leader was Alexander the Great, the Macedonian king who spread Hellenistic culture as far as India through his aggressive military campaigning and skill at military strategy. The Carthaginian general Hannibal, who led an army across the Alps and terrorized the people of the Italian countryside, is another of these famous military figures; his tactics are still studied in military academies today.

This was also a period in which antiwar sentiments flourished, especially from within religious traditions. Confucian thinkers argued that war was symptomatic of bad leadership and articulated approaches to end conflicts and create sustainable peace. Christian writers such as Origen made antiwar arguments based on the teachings of Jesus, which stressed peace and love for one's neighbors. Some of the art of this period also reflects antiwar sentiments. Aristophanes' play *Lysistrata* (411 BCE) provides a humorous account of Greek women who, tired of constant warfare, withhold sexual relations from their husbands until fighting comes to an end.

Warfare was not the only means through which ancient peoples interacted; diplomacy played an important role in facilitating relationships between polities. In the cities of ancient Greece, foreign ambassadors were hosted by the *proxenos*, a citizen who hosted these foreigners within the community at his own expense. The *proxenos* received various honors from the state for fulfilling this role and worked to build peaceful relationships between the two cities. In times of war in Greece, heralds were special envoys who held immunity from conflict and were thought to be protected by the messenger god Hermes. During times of war, diplomatic messages between warring cities could be safely communicated by these divinely protected messengers. Wars were often brought to a close by peace treaties, a practice that began in the Near East before 1000 BCE but is in evidence in Asia and Europe as well after 1000 BCE. In China, for example, Emperor Wen of the Han dynasty ratified a treaty in 162 BCE that guaranteed that lands on the south side of the Han-era Great Wall belonged to the Han Chinese and the lands to the north belonged to the Xiongnu, a group of nomadic peoples originally from central Asia. This treaty was negotiated many times over the course of the Han dynasty and prevented nomadic raids to the south with varying degrees of success. *Heqin* ("peace marriages") were also offered to

build peaceful relationships between the Han and Xiongnu people. By marrying princesses off to foreign rulers, it was thought that peaceful relationships could be established. Marriage alliances were not unique to China at this time, there being a long history of this type of peaceful relation building in the Near East and the Mediterranean as well.

Theoretical writings on diplomacy and statecraft also appear for the first time after 1000 BCE. Sun Tzu argued that diplomatic actions such as building alliances, negotiating land rights, and signing peace treaties were important strategic activities and discusses them in his *The Art of War*. The *Arthashastra* is a Mauryan-era treatise on statecraft that includes instructions on appropriate diplomatic behavior. As Sun Tzu does, the author of the *Arthashastra* argues that the wise king builds alliances as part of a long-term strategy.

—Kevin M. McGeough

■ Introduction: The Rise and Fall of Empires

Truly massive empires—a type of political organization in which a strong core region governed a significantly larger and politically weaker periphery—became normative for much of the world between 1000 BCE and 300 CE. Prior to this, the Egyptians and Mesopotamians had built empires that included parts of Africa and Asia Minor outside of their perceived homelands.

From about 800 BCE to 650 BCE, the Mesopotamian kingdom of Assyria expanded Mesopotamian holdings to an extent never before seen. By 612 BCE, however, the Assyrian empire had been taken over by the Neo-Babylonians (also from Mesopotamia). In 539 BCE the Neo-Babylonian empire was taken over by the Persians, whose massive empire, at its largest extent, covered much of western Asia and Egypt. The Persian empire was one of the most powerful forces in Asia, Africa, and Europe until its defeat by Alexander the Great's Army in 332 BCE, when it became incorporated into the Hellenistic Greek empire, a short-lived empire that extended from Greece to India and Afghanistan. In 322 BCE after the collapse of the Hellenistic empire, a new political force emerged in India under King Chandragupta Maurya. The so-called Maurya period that followed saw the development of the first massive Indian empire, under the leadership of King Aśoka (304–232 BCE). In 185 BCE

this empire collapsed, and India became divided into smaller kingdoms. Farther east, the Qin state had gained control of much of China by 226 BCE. This empire was short-lived but laid the foundations for the much longer-lasting Han dynasty, which ruled China and its empire (with a brief interruption) from 206 BCE to 220 CE. Starting around 500 BCE, the city of Rome began its gradual expansion throughout Italy, an expansion that would lead to its eventual conquest of Egypt and North Africa, the Near East, and much of Europe. Concomitant with the rise of Rome was the rise of the Parthian empire, which emerged in northeastern Iran.

—Kevin M. McGeough

The Kingdom of Kush

The Kingdom of Kush was Egypt's powerful southern neighbor, located south of the Third Cataract of the Nile River in upper Nubia (present-day Sudan). The history of Kush spans more than 1,000 years (from approximately 1000 BCE to 350 CE) and is divided into two periods, the Napatan period (ca. 1000–310 BCE) and the Meroitic period (ca. 275 BCE–350 CE). Each period is sometimes called a dynasty, a kingdom, or an empire.

After the withdrawal of the ancient Egyptian administration, which had controlled most of

➤ KUSHITE RELIGION

Kushite religion is an amalgamation of ancient Egyptian religious traditions and deities with traditional Nubian customs, beliefs, and gods of which very little is known.

Archaeological evidence shows that ram cults held much importance for the Nubians prior to the Egyptian conquest. In order to legitimize their claim over Nubia, the Egyptians associated their god Amun with the Nubian ram cults, declaring that the (new) ram-headed form of Amun had resided in Nubia from times immemorial and that the Pure Mountain (Gebel Barkal) was the seat of kingship. Centuries later the Napatans reversed the roles and used Amun to claim dominion over Egypt.

The ram-headed Amun was worshipped all over Nubia during the New Kingdom and Kushite periods. Amun of Napata dwelt within the Pure Mountain, and other local forms of Amun were

worshipped at Kawa, Pnubs, Meroe, and Naga, among others. As the god who granted kingship, Amun was deemed the most important in the Kushite pantheon; however, he was not the only Egyptian deity worshipped in Nubia. Isis, Osiris, Hathor, Anukis, and Bastet are attested, among others.

During the Meroitic period, local Nubian gods took their righteous place in the pantheon. The most celebrated Meroitic deity is the lion-headed god of war Apedemak. Other Meroitic deities include Sebiemeker and the goddess Amesemi. Until the Meroitic language is deciphered, very little can be understood of Meroitic religion and deities other than that they were worshipped in a manner similar to those of Egypt, attended by priests in magnificent temples.

—*Caroline M. Rocheleau*

Nubia during the New Kingdom (ca. 1540–1075 BCE), a local Nubian chiefdom emerged at the turn of the millennium. This new political power was centered at Napata, the city at the foot of the so-called Pure Mountain at Gebel Barkal near the Fourth Cataract. Very little is known of the formative years of the Kingdom of Kush. Archaeological evidence is scant and written documents nonexistent, because at the time the Nubians did not have a writing system of their own.

Around 785 BCE a local chief known as Alara united upper Nubia. He is acknowledged by later kings as the founder of the Napatan dynasty of Kush and is believed to be the one who restored the cult of the god Amun in Nubia at the sacred site of Gebel Barkal. The Kushites also adopted ancient Egyptian and the hieroglyphic writing system as the administrative and religious language of their kingdom. Kashta, Alara's successor, united upper and lower Nubia into a single political entity, and he called himself "King of Upper and Lower Egypt," as mentioned on his small stele at Elephantine.

However, it was Piye (formerly known as Piankhy) who actually conquered and took control of Egypt and annexed it to the Kingdom of Kush (747–716 BCE) during the third year of

his reign. Piye founded the Kushite Twenty-fifth Dynasty of Egypt, and his successor Shabaka (Shabaqo) established the capital at Memphis. The Kushite kings held sway over all of Egypt for almost a century, following traditions established by earlier Egyptian kings. In honor of the god who granted them kingship, they added new monuments to the architectural complex of the Temple of Amun at Karnak (Thebes), the religious center of this god in Egypt. The Kushites remained active in their homeland, erecting new temples to the god Amun and refurbishing ruined ones built by the Egyptians during the New Kingdom. The Kushite Twenty-fifth Dynasty was expelled from Egypt by the Assyrians, who sacked Thebes in 663 BCE. King Tawetamani had already taken refuge at Napata.

Most of what is known of the remainder of the Napatan period comes from Kushite royal documents, which were still written in Egyptian using hieroglyphs despite the fact that the Kushites had lost control over Egypt. These documents—stelae and wall inscriptions—come mostly from temples and royal burials and concern mostly the north of the kingdom. Very little else is known of this period, especially regarding the local general populace. Few village settlements dating to this period have been discovered

and excavated by archaeologists. As for Meroe and the south of the kingdom, practically nothing is known. From what can be gleaned from the archaeological record and literary documents, the Kushites kings continued managing affairs of the state, building and renovating temples, and mounting military expeditions. The Kushites were defeated by the Egyptian king Psammetichus II, possibly during the reign of Aspelta (ca. 593 BCE) at a battle near the Third Cataract. However, beliefs that Psammetichus II reached the Fourth Cataract and sacked Napata are unsubstantiated. This might have encouraged the Kushites to move farther south.

Although there is archaeological evidence that Meroe had been occupied since at least the eighth century (notably as the Napatan royal residence since the fifth century), the focus of the Kushite kingdom had been until then on Napata and the north. The Meroitic period begins shortly after 300 BCE with the relocation of the royal cemetery from Nuri to Meroe, the first pyramid there being that of King Arkamani I (ca. 275–250 BCE).

From that moment on, Meroe became the center of the Kingdom of Kush. Important cultural changes occurred during the Meroitic period as the Kushites gave their own traditions and customs prominence over many borrowed from Egypt. The most significant change is that of the language. For the first time in Kushite history, the native language, Meroitic, became the official language of the kingdom, and a hieroglyphic alphabet derived from Egyptian signs was created to write it.

Temples were built not only to the Egyptian god Amun but also to the indigenous lion-headed god Apedemak (the best known of the Kushite gods). The architecture favored for the lion temples is much simpler than Egyptian temples (although inspired by it) and generally consists of a single room with a large pylon (main gate). Even the relief decorations on temple and tomb chapel walls changed to suit the Meroitic idea of beauty, power, and fertility. The *qore* (Meroitic word designating the king as commander) and the *kandake* (ruling queen) wore a different royal costume, which was modified from that of Egyptian kings. The Kushites used centuries-old pharaonic influences and ideas from

the Mediterranean world and incorporated them with their ancestral customs to create something different and truly their own: Meroitic culture.

At the time when Egypt had become a province of the Roman empire, the Meroitic Kingdom of Kush was a force to reckon with. The wrath of the Meroites was provoked when the Romans tried to take over Lower Nubia. Led by mighty leaders, the Kushites sacked Aswan, Elephantine, and Philae. The Romans retaliated by sacking Napata, but both parties eventually worked out an agreement. The great *kandake* who held strong against the Roman Army is believed to be Amanishakheto.

The Meroites still held power over lower and upper Nubia until the mid-fourth century CE. Military campaigns by Ethiopian rulers of the Kingdom of Aksum as well as the decline in wealth and political power of the royal family appear to have brought the Kingdom of Kush to an end.

The Carthaginian Empire

Carthage is well known as the Phoenician city whose brilliant general, Hannibal Barca, defeated Roman legions many times during the Punic Wars. Yet Carthage was also heir to a much older Phoenician society and the leader of a colonial empire that extended the length of the Mediterranean, ruling from this sprawling metropolis in what is today known as Tunisia on the coast of North Africa.

The society, culture, and many of the people of Carthage came from the land now called Lebanon. By tradition, this city was founded in 814 BCE by Princess Elissa (also known as Dido)

from the Phoenician city of Tyre. She was said to have brought a large fleet bearing many people and great wealth to start this colony on the part of North Africa closest to Sicily and Italy. Carthage soon outshone the earlier Phoenician settlements, which extended from Lebanon and Cyprus in the east to Spain and Morocco in the west. Its ideal location at the midpoint of the long line of Phoenician trading posts allowed it to rise to a position of leadership among them.

When Greek settlers came westward in 734 BCE and began to plant colonies on eastern Sicily at Naxos and Syracuse, Carthage rushed to place many more Phoenician colonies across western Sicily, Sardinia, Corsica, Spain, and the long coast of North Africa. Tyre had been the leading Phoenician city up to this time, but now Assyria began to establish itself as overseer of the northern Levant, including Phoenicia. While the Phoenicians retained considerable independence in exchange for the tribute they paid, the constraints were gradually tightened. As a result, Carthage was thrust into a leadership role among the Phoenicians, and the vast carpet of colonies across the Mediterranean came to be called the Carthaginian empire.

The sixth century BCE marked the emergence of military leaders in Carthage, a rare occurrence in the Phoenicians' long history. General Mago raised an army and went to Sicily to push the Greeks out of Carthage's claimed lands in the western part of that island. After 70 years of fruitless fighting, a peace was reached that produced little change in territory. It did, however, give the people of Carthage a taste for the Greek sculpture and artworks captured during these battles.

It should be mentioned that almost all our written knowledge of Carthage and the Phoenicians came from their enemies. The Phoenicians wrote no surviving histories of their own, so we rely on accounts by Greeks and Romans, who regularly battled with the Phoenicians.

Some of those sources claimed that child sacrifice was practiced by people at Carthage. However, other scholars have cast doubt upon that conclusion. Archaeological finds of special plots called *tophets* for young children raised serious questions, yet natural mortality followed by special rites have also been offered as reason-

➤ HANNIBAL'S END

Often compared to Alexander the Great, Julius Caesar, or Napoleon I, Hannibal was the greatest Carthaginian general during the Second Punic War. This bust dates from the first century BCE. (Bettmann/Corbis)

Hannibal (247–182 BCE) is well known for his successful battles against Rome. However, he also survived the Second Punic War and led Carthage through a difficult peace. When Rome ordered Carthage to hand him over, Hannibal escaped to Anatolia. There he continued to fight against the Roman forces seeking footholds in that region. Ultimately, however, Roman soldiers pursued him to Libyssa near present-day Istanbul in Turkey, where he is said to have taken his own life rather than let himself be captured.

—Sanford Holst

able explanations. A complete explanation remains elusive.

In the peace that followed the fighting in Sicily, Carthage returned its full attention to sea trade and prospered as never before. It became a widespread metropolis whose population may have reached 700,000 people. Many beautiful public places were built in its districts, which showcased the artworks that it so highly prized. Carthage even concluded treaties for additional trade with a small but growing city in Italy known as Rome.

In 333 BCE Alexander the Great entered the Levant on his march of conquest from Greece, and by the next year he had taken all of the ancient cities on the Lebanese mainland. From that point on, Carthage was unquestionably the last remaining leader of the Phoenicians.

Just after this time, Rome established itself across Italy by taking the lands that had belonged to the Etruscans to its north and to Greek

colonists to its south. Its legions then turned southward toward Sicily and the empire of Carthage, launching the Punic Wars in 264 BCE. The Romans were keenly aware that Carthage was a Phoenician city, and it is from their Latin word for Phoenicians (*Poeni*) that the Punic Wars received their name. After 23 years of fighting, the Romans managed to take all of Sicily, and a peace treaty ended the first war. However, when Rome then seized Sardinia and Corsica from Carthage, the stage was set for more fighting.

Hannibal Barca became Carthage's commander of the army at 26 years of age and two years later replied to perceived Roman encroachment into Carthaginian land in Spain by sacking the city of Saguntum, a Roman ally. The following year, 218 BCE, Hannibal famously led his force of soldiers and elephants across the Alps to attack Rome. Thus began the Second Punic War. Throughout this conflict Hannibal was invincible in Italy, defeating the Roman legions many times. When the Roman general Scipio counterattacked into North Africa, Carthage sought to negotiate a peace treaty and recalled Hannibal to that city. Those peace talks failed, and a final battle was fought at Zama. The battle went in Rome's favor, and the war came to an end. By taking virtually all of the Phoenician colonies, Rome was able to create its first foreign provinces, including lands as far as Spain and Morocco.

A third and decisive Punic War was fought, which resulted in Carthage being totally destroyed in 146 BCE. The vast empire of Carthage and the Phoenicians was no more.

The Assyrian Empire

At the end of the tenth century BCE Assyria was little more than a narrow strip of land on the banks of the Tigris. But this same period was

marked by weakness in its neighbors. Babylonia was struggling, Egypt was ruled by chieftains from Libya, and Assyria's other three great rivals had not yet come to fruition. Furthermore, Assyria, while small, was not an insignificant power. Assyria had a powerful well-trained and well-equipped army and a stable dynastic line that had ruled for more than 200 years. The time was ripe for the rise of a new Assyria.

In 911 BCE Adad-Nirari II became king of Assyria and took the first steps toward building a Neo-Assyrian empire. After numerous successful Assyrian conquests in the vicinity of Mesopotamia the wealth of Assyria grew, and even more could be spent on warfare. With the accession of Shalmaneser III (in 858 BCE), empire building became a key goal of Assyrian kings. Shalmaneser spent 31 of his 35 years as king of Assyria making war against his neighbors. He campaigned in Cilicia, in the Levant, into the Taurus and Zagros mountains, and on the shores of the Persian Gulf. The Assyrian Army was not, however, always victorious during his reign, and many of his victories were offset with defeats and setbacks. Shalmaneser never managed to completely subdue his enemies. After one of his failed attempts he headed south into the Levant and accepted tribute from local rulers including Jehu of Israel, who is depicted as giving Shalmaneser tribute on a Black Obelisk. In 851 BCE Shalmaneser was called to help the Babylonian king put down a coup that brought his forces all the way to the Persian Gulf, but no territorial gains were made in the process. In Shalmaneser's final years one of his sons revolted, and another son, Shamshi-Adad, was placed in charge of stemming the revolt.

After numerous kings spent much of their reigns attempting to quell revolts, Tiglath-Pileser III conducted administrative reforms that finally gave Assyria some internal stability. He also restructured the army, creating a standing military force instead of the conscript army of his predecessors. He instituted policies of mass deportations in conquered territories to destabilize them and reduce the chances of rebellion. He conducted campaigns in southern Iraq and in Syria, gaining control of Phoenicia and much of Syria. With the west under control, he turned to the east and the territory of the Medes. He fol-

lowed that with a campaign against Assyria's great rival of Urartu, though the siege of its capital of Tushpa was unsuccessful. In 734 BCE he intervened in Tyre and Sidon to deal with unrest sparked by restrictions on trade with Egypt. This was followed by putting down a revolt led by the Philistine cities of Gaza and Ashkelon and shortly thereafter by his intervention in affairs among Judah, Israel, and Damascus. This led to the annexation of large parts of Israel to the Assyrian empire and the capture of Damascus.

Shalmaneser V, Tiglath-Pileser's son, ruled only briefly, and little is clearly known of his reign. He is known to have besieged the Israelite capital of Samaria for three years, but it is unclear whether he or his successor, Sargon II, was the actual conqueror of the city.

Sargon II came to the throne in a period of international crisis. Tiglath-Pileser's conquests had affected the economies of Elam and Egypt, which had lost key trade routes and partners, and it was clear that they would need to find new sources of revenue in the region in order to survive. As a result, both of these states began meddling in what was deemed to be Assyrian spheres of influence. Elam supported the revolt of Merodach-Baladan in Babylonia, while the Egyptian Army supported revolts in the Levant. Sargon was forced to campaign in both regions several times during his reign. Assyria's other great enemy, Urartu, was also challenged, and its sacred city of Musasir taken. While Urartu was not crushed it was weakened but not before it could spread further dissension. By 710 BCE Assyria was in control of most of the Near East and was surrounded by mostly ineffectual rivals. Sargon took the opportunity to deal with Babylonia and took the city of Babylon. This resulted in many of the remaining rivals, including Phrygia, offering him friendship.

Sargon's son Sennacherib inherited a kingdom that was less threatened than that of his father. It was also difficult to maintain, so he really did not try to expand it and instead spent his reign trying to solidify his hold on it. With the appearance on the scene of the Cimmerians, Urartu and Phrygia became less-significant threats, as their attentions were drawn elsewhere. Sennacherib took the opportunity to consolidate Assyrian holdings in the area adjoining the lands of

the Medes and Cimmerians with four campaigns in the north and west. In 701 he faced a coalition of rebellious kings in the Levant, including Hezekiah of Judah. Sennacherib was not entirely victorious, and while he was preparing to invade Egypt, some mysterious fate afflicted his army, which was forced to return to Assyria. In 694 he assembled a fleet of ships manned by Phoenician and Cypriot seamen and sailed down the Tigris to attack Elam. This resulted in the conquest of new territory but more importantly in the angering of the Elamites, whom the Assyrians spent the next seven years fighting. In 689 Babylon revolted yet again, and after putting down the rebellion Sennacherib destroyed the city.

Sennacherib's successor, his son Esarhaddon, put down revolts and maintained relative peace in Iraq. In the Levant he put down a Sidonian revolt that resulted in Sidonian territory being given to the rival city of Tyre. In 679 a new threat reared its head in the form of Scythian nomads whom he promptly repelled. In 671, with all of his borders secured, he attempted what no other Assyrian king had tried before: he attacked Egypt. Resistance was unsuccessful, and Taharqa was forced to flee south to Ethiopia. Esarhaddon's hold over Egypt was spurious, however, and Taharqa returned several years later and retook the country.

Following Esarhaddon's death, his son Ashurbanipal inherited the task of putting down the Egyptian revolt. The Assyrians attacked Egypt with a large force, including auxiliaries from 22 Levantine cities, and took the capital at Memphis. The Assyrians were never really successful in maintaining control over Egypt, and several successful rebellions ensued. With every successful revolt in Egypt came revolts on the Levantine coast from Egyptian-supported Assyrian vassals like Tyre and Arvad. This forced Ashurbanipal to besiege Tyre in order to force its surrender.

In 665 Psamtik of Egypt rebelled and, with the help of Greek mercenaries, was able to overthrow the Assyrians. Much of this Assyrian failure stemmed from Ashurbanipal being forced to keep the bulk of his army in the east dealing with Elam. While he was successful there, events were more complicated in the south. Shamash-Shumukin of Babylon revolted and formed a coalition of Assyria's enemies stretching as far as Egypt and the

Levant. For three years the Assyrians fought the Babylonians before they surrendered. Mop-up operations followed as he sought to punish some of the groups who had aided the Babylonians, such as the Arabs and the Elamites. Over time, Assyria gained control over all of Elam and destroyed its capital at Susa. Toward the end of the reign of Ashurbanipal our historical information becomes sparse, but in 639 the Medes attacked unsuccessfully. A subsequent Median attack was thwarted by the newly appeared Scythians.

After the death of Ashurbanipal, Nabopolassar, the governor of Babylon, revolted and established the Neo-Babylonian kingdom. For 12 years Assyria and Babylon fought a back-and-forth war over control of southern Mesopotamia. With greater successes on the part of the Babylonians, the Assyrians under Sinsharushkin appealed to the Egyptians for help but failed to receive timely or adequate aid. In 615 the Medes, seeing the opportunity, attacked Assyria and took Arrapha and Ashur. The Babylonians established a treaty of mutual friendship with the Medians and spend the next five years slowly dismantling Assyria. By 612 most of its major cities had been captured and destroyed, but under Ashurbanipal II a remnant of the empire managed to hold out until 610, when Harran finally fell and brought to an end the Assyrian empire.

Egypt had attempted to come to Assyria's aid but had been unsuccessful. After the fall of Assyria, the Egyptians moved into the Levant to fill the power vacuum. In 607 Nebuchadnezzar, the Babylonian crown prince, was called upon to deal with them. By 605 he had driven them from their stronghold at Carchemish and eventually campaigned throughout the Levant on several occasions, resulting in the destruction of such great cities as Ashkelon and Jerusalem. By 586 the Neo-Babylonian empire stretched from the border with Egypt in the west to Mesopotamia in the east.

The Achaemenid Empire

The Achaemenid empire (550–330 BCE) was one of the largest empires of the ancient world, based in Persia and stretching as far as Egypt and Pakistan. The name “Achaemenid” refers to the royal family; while the members of the Achaemenid royal family believed that they could trace their roots back to the possibly mythical Achaemenes, it was not until the arrival of Cyrus II that the empire began to develop. Cyrus began by consolidating his control over Iran. Initially, Cyrus was ruler of a Persian kingdom that was subservient to the Medes. In 554 he revolted against the Medes and took their capital at Ecbatana. With control over Media and Persia, Cyrus became a power to be reckoned with, controlling much of Iran, Syria, northern Mesopotamia, and Anatolia. Around 546–547, Cyrus conquered Lydia and occupied its capital of Sardis. Croesus, the king of Lydia, had sought the help of his allies in Egypt and Babylon, but they arrived too late when Cyrus attacked during winter instead of waiting for the spring thaw. Lydia had been one of the wealthier of the powers in the region. Conquering Lydia provided Cyrus a huge war chest. Around the same time as Croesus's defeat, Cyrus offered terms to the Greek cities on the coast of Turkey, but only Miletus capitulated. The remaining cities, which had previously been vassals of Lydia, revolted and, with Spartan help, tried to stand their ground but failed. As a result, Cyrus now controlled the coast and islands of Ionia, Caria, and Lycia.

With his successes in the west, Cyrus turned to the unconquered territories of eastern Iran. Following the conquest of these lands, he controlled as far east as Bactria (now northern Afghanistan and southwestern Uzbekistan). The remaining thorn in his side was Babylon, which was at a weak point in its history. Babylon was ruled by Nabonidus, and he had alienated the Babylonian priesthood and many of the elites in

his country. Cyrus met and defeated the Babylonian Army at Opis in October 539. On October 10, Persian troops entered Babylon and encountered no resistance. With the conquest of Babylon came control of all of Babylon's vassals, including the cities of Phoenicia, Philistia, and Judah.

After the death of Cyrus, his son Cambyses II became ruler of the empire. Cambyses's empire included most of the ancient Near East with one very significant exception, Egypt. Cambyses, well aware of this serious threat to his empire's size and security, set out to remedy this. The new ruler rallied his troops, arranged with the Phoenicians and Arabs for the supply of fresh water via camel caravans, and attacked. In 525 Cambyses defeated the Egyptian armed forces at Pelusium and established himself as king of Egypt and founder of its Twenty-seventh Dynasty.

While Cambyses was in Egypt, a coup occurred in the Persian heartland that ultimately resulted in Darius I Hystaspes taking the throne. With this change in rulers began a consistent pattern in the future history of the Near East in the Achaemenid period. At the death of virtually every Persian king, a period of instability ensued in which vassal states rebelled. In this case, revolts broke out in Persia, Elam, Media, Assyria, Egypt, Parthia, Margiana, Sattagydia, and Scythia. The first job of almost every new Persian king became solidifying control over the Persian heartland and reestablishing control over the empire. Within a year Darius had events under control.

In 517 Darius I began his campaigns against Greek city-states and over the next five years conquered the islands of Samos and Chios followed by Thrace and Macedonia. He even crossed the Danube and campaigned against the European Scythians. In the east he added the new province of the Indus to the empire. In 499 Greeks in Cyprus and along the Aegean coast rebelled and sacked the satrapal capital of Sardis. The Persians, with the help of the Phoenicians, put down the revolt on Cyprus, but the Aegean cities were not reconquered for another five years.

The Persians also engaged the Athenians for the first time but were defeated at the Battle of Marathon in 492. Shortly thereafter Egypt, sensing weakness, revolted against Persian rule, which caused political disturbances throughout

the region. In the midst of the chaos Darius I died and Xerxes I ascended to the Persian throne. Egyptian independence was short-lived when the Persians, under Xerxes' own command, reconquered Egypt. Xerxes punished the Egyptians severely for their revolt. He also put down two rebellions in Babylonia.

In 483 Xerxes began his preparations for what would eventually be the campaign against Greece. This campaign lasted until 479 and ended with a series of defeats for the Persians at the battles of Salamis, Plataea, and Mount Mykale. In a subsequent campaign, the Persian fleet was destroyed while attempting to attack the Greeks. With these defeats there was a dramatic change in the balance of power. The Persian Army was weakened and no longer seen to be invincible, while Persia's mighty fleet had been destroyed and would have to be rebuilt.

In 449 the Greeks and Persians negotiated the Peace of Callias. With this change in policy toward the Aegean world, Persia was now able to divert resources from military preparations against the Greeks to other more pressing issues such as stabilizing their hold over their extant territory. Furthermore, shortly thereafter the Peloponnesian Wars began in Greece, and as a result the Persians did not need to worry about problems stemming from the Aegean, since not only did they have a peace agreement with the Greeks, but the embattled Greek cities were in no position to harass them.

Following the conclusion of the Peloponnesian Wars, the period of calm and peace that had been in existence for the previous half century ended. In 404 Artaxerxes II Memnon replaced Darius II on the throne. A weak king, Artaxerxes II's reign marked the beginning of a weak point in Persian rule. During his and part of his successor's (Artaxerxes III) reigns, Egypt experienced a period of independence from Persia. With a weak Persian emperor in place and the Greek world at peace with itself, the Spartans were again able to trouble the Persian empire. Shortly after the end of the wars, they joined in an alliance against Persia with the Egyptians. In 401 Artaxerxes' brother Cyrus, satrap at Sardis, rebelled and with an army of Greek mercenaries marched against his brother. Cyrus was killed at the Battle of Cunaxa, and

10,000 Spartan mercenaries were forced to fight a retreat back to the Black Sea, a story recorded by Xenophon in the *Anabasis*.

A brief period in which a revitalization of Persian control over Phoenicia occurred when Artaxerxes III led a force under his direct command to quell a revolt there and succeeded where his general had failed. In order to set an example, Artaxerxes destroyed the city of Sidon. Since the Persian policy of relative benevolence had largely proven to be a failure, he deported a large number of the Sidonian population in the manner of the Assyrian and Babylonian kings who preceded him. By 344 all of the rebellious Levantine cities surrendered to Persian authority. Artaxerxes severely punished some of the cities and deported many Phoenicians. After the success of his Levantine campaign, Artaxerxes III turned his attention once more to Egypt and succeeded in retaking Egypt. After a string of successes, a sudden end came to Artaxerxes' luck when he was assassinated in 338. His death marked the beginning of the end for the Achaemenid empire. Egypt again rebelled, and Darius III was forced to invade again. But the empire was already in its death throes. Its final years were a period of upheaval in the heartland of the empire stemming from weak kings and court intrigue. Furthermore, the empire was beset with trouble from the outside with the onslaught of the Macedonian Greeks. In 334 Alexander II of Macedon marched against the Persians. After a string of unexpected victories by the Macedonians at Granicus, Issus, and Gaugemela, Darius fled, abandoning his possessions, and was murdered by one of his own courtiers. With his death, Alexander became ruler of what had been the Achaemenid empire and was now to become the Hellenistic empire.

The Hellenistic Kingdoms

During his lifetime Alexander the Great greatly expanded the Macedonian empire that had been left to him by his father Philip, which included Macedonia and most of the Greek peninsula to encompass all of the former lands of the Persian empire and parts of what is now western India. Beyond Alexander's military accomplishments, this conquest changed the face of the ancient world by spreading Greek ideas throughout the Near East. Since Alexander died en route and, following his death, the lands were divided, the resulting political structure is generally referred to as the Hellenistic Kingdoms, which lasted until Rome's annexation of Egypt following Octavian's defeat of Marc Antony and Cleopatra.

Alexander died without establishing a line of succession, which resulted in a civil war among his generals that lasted 20 years. By 306 BCE, although the war had not officially ended, two leaders, Seleucus and Ptolemy, had emerged triumphant, and these men divided the lands of the former Persian empire among themselves. Seleucus won the lands of the former Persian empire to the east of Egypt, while Ptolemy established his rule in Egypt, perhaps the wealthiest of these territories. Macedonia and the Greek peninsula remained sporadic war zones as various rulers fought for the right to rule the former seat of Greek power.

When Alexander departed for the conquests in the 330s BCE he had left Antipater in Macedonia to rule in his name. Following Alexander's death and shortly before his own, Antipater chose a man named Polyperchon as his successor. In 316 BCE shortly after Antipater's death, his son Cassander overthrew his father's successor and maintained control of Macedonia and much of the Greek peninsula until his own death in 298 BCE. Over the next 22 years this region would have five short-lived rulers until in 276 BCE Antigonus Gonatas (r. 276–239 BCE) established the Antigonid dynasty in Macedonia and Greece, which lasted until its final successor was defeated by the Romans in 168 BCE.

The Antigonids were never able to maintain absolute control over the Greek mainland, and even within Antigonus Gonatas's lifetime various

city-states, including Corinth, Athens, and Sparta, rose up against the new dynasty. In several of these instances the Ptolemaic rulers directly aided these city-states in order to undermine the position of the Antigonids. The period cannot be viewed as one of continuous Antigonid domination of the Greek mainland but rather as an era in which Greek city-states sometimes played one regional power against the other and sometimes were forced to submit to the will of one of the powers.

By the late third and early second centuries BCE the Antigonids found themselves competing with their non-Greek neighbors for control of the seas and influence over the Greek mainland. After entering into a treaty with Hannibal during the Second Punic War (218–202 BCE) the Antigonids, under Philip V, found themselves in conflict for the first time with the Roman republic, a rising power in the western Mediterranean world. Philip fought two unsuccessful wars against the Romans and their allies (211–205 BCE and 201–197 BCE) and subsequently became a loyal Roman ally. Following Philip's death in 179 BCE, Perseus rose to power, and after angering Rome by apparently attempting to spread his influence over parts of the Greek world now deemed by the Romans to be outside the Macedonian sphere of influence, the Antigonids again found themselves at war with the Romans. The Third Macedonian War (172–168 BCE) witnessed the ending of the Antigonid dynasty, as Perseus was defeated and captured by the Roman general L. Aemilius Paullus in 168 BCE at Pydna. This did not end Roman interference in the Greek world nor did it mark the end of independent city-states in Greece, but this date does mark the end of the Antigonid kingdom.

Unlike the Ptolemaic and Antigonid kingdoms, the Seleucids ruled over a vast kingdom populated by multiethnic peoples. The Seleucids were able to build upon the infrastructure established by the former Achaemenid Persian empire and thus fostered the development of large urban centers such as Antioch and enjoyed the accompanying generation of cultural and economic capital. The first ruler of this dynasty, Seleucus I, ruled consistently from 305 to 281 BCE, although he had also controlled much of this area in the

years immediately following Alexander's death. It is unknown whether Seleucus attempted to invade Macedonia in the 280s BCE, but either way he never gained control of this region. Perhaps learning from the succession problems that had accompanied Alexander's death, in 292 BCE Seleucus named his son, Antiochos I, as coregent. This paid dividends for the new dynasty following Seleucus's assassination in 281 BCE, as Antiochos seamlessly gained full control of the empire. The combined reigns of Seleucus and Antiochos (305–261 BCE) represent a golden age for the dynasty but may also have laid the foundation for future problems. Although it remains a topic of debate among modern scholars, one argument is that both Seleucus and Antiochos concentrated their energies on western Iran and Asia Minor. This in turn brought their empire into conflict with the neighboring Ptolemies and allowed the eastern parts of the kingdom to gradually slip out of their control.

During the reigns of Antiochos II (261–246 BCE) and Seleucus II (246–226 BCE) the Seleucids began to lose their grip on the eastern provinces. It was in this period that the Parthians, the first new Persian dynastic group to emerge after the fall of the Achaemenids to Alexander in the fourth century BCE, began to gradually conquer the northeastern parts of the Seleucid empire. While the Parthians continued to recognize the Seleucids as the legitimate rulers of all of these areas, in practice they succeeded in creating their own empire in this period.

Another breakaway state in the Seleucid empire was the polis of Pergamum, which eventually developed its own miniempire in northwestern Asia Minor. It broke away in 283 BCE but became a major power a century later when its leader allied with the Romans in a way against the Seleucids. The king of Pergamum willed his throne to the Romans who, later on, were only too happy to collect on their inheritance, thus ending this period of independence. Pergamum, however, represents a dynamic independent city-state in the Hellenistic period that, for a time, was able to play larger Mediterranean powers against one another and reap the benefits.

By the late second century BCE the Seleucids, like the Antigonids, met the Romans on the

battlefield (192–189 BCE). Like the Antigonids, the Seleucids lost these battles and by 189 BCE had lost their possessions in Asia Minor. Over the course of the next century the Seleucids continued to lose territory as the Romans worked to undermine the dynasty in the eyes of its subjects. Ethnic groups such as the Jews and Nabataeans took advantage of this situation and created autonomous enclaves. The kingdom also suffered through civil wars and again came into conflict with the Romans in the 60s BCE, resulting in the cessation of the dynasty in 63 BCE at the hands of the Roman general Pompey.

The third major Hellenistic kingdom was Ptolemaic Egypt. Ptolemy had been named a satrap (governor) of Egypt in 323 BCE and eventually won outright control of the new territory during the civil wars that followed Alexander's death. Perhaps Ptolemy's greatest feat was in keeping both native Egyptians and the newly arrived Macedonian and Greek elites and soldiers simultaneously loyal to his rule.

From the beginning Ptolemy linked his rule to Alexander's and even built up Alexandria, one of the cities that the deceased conqueror had founded and named after himself, into the greatest intellectual center of the Hellenistic world. It was in this period that Alexandria boasted the Great Library, which housed many of the greatest philosophical, historical, and literary tracts of the ancient Mediterranean world. Alexandria, beginning in this period but continuing for many centuries during the subsequent Roman period, was also a cosmopolitan melting pot that included native Egyptians, Greek elites, and a significant Jewish community.

During the third and second centuries BCE the Ptolemaic dynasty, though it suffered through internal power struggles and native uprisings, acted as one of the major powers in the eastern Mediterranean. The dynasty possessed a formidable navy and often interfered in its neighbors' affairs, in many instances Seleucid and Antigonid affairs. By the late second century and early first century BCE controversy over dynastic succession brought the Romans into Ptolemaic affairs, as prior to his death Ptolemy X (r. 107–96 BCE) left Egypt to Rome in his will. Although the Romans did not immediately take over Egypt, they now had a legitimate reason to interfere in the

kingdom's internal politics. The first century BCE witnessed the end of the Ptolemaic dynasty but not before one last instance of power. During the Roman civil wars that accompanied the 1st and 2nd Triumvirates of the mid-first century BCE, Cleopatra, for a while, successfully played one side against the other, first as Julius Caesar's mistress and, following his death, as Marc Antony's lover. Unfortunately for both Marc Antony and Cleopatra, Octavian, Julius Caesar's great-nephew, unexpectedly won a series of key victories against Marc Antony's armies and eventually defeated the couple's naval fleet at the Battle of Actium in 31 BCE. This marked the end of the Ptolemaic dynasty, as Rome soon annexed this wealthy region. Although it lasted longer than the other kingdoms, the Ptolemaic dynasty weathered periodic native revolts and eventually succumbed, as did the other kingdoms, to the rising power of Rome.

The Emergence of the Roman Empire

The rise of Rome into the world's dominant power, stretching from Britain into the Middle East, resulted in an unprecedented political union as well as an awesome cultural force, the remains of which have survived into the present day. This development had an unlikely starting place: a small village on the banks of the Tiber River at war with surrounding towns and struggling to survive. The mythical stories of Rome's founding—as in the *Aeneid* of Vergil and in Livy's *History*—are consistent with the evidence of archaeology: by the middle of the eighth-century BC a civic and political center existed, and as those Romans confronted the Etruscans

to the north and the Latins to the south, uneasy alliances or outright annexations allowed them to gain some measure of ascendance over their less-energetic neighbors.

What seems to modern eyes as well as to later Roman historians as a relentless, inevitable drive to world dominance was a bit more fitful at the time. In 390 BCE the Celts sacked Rome itself, an event that remained long in Roman memory. But the drive was real, and the Romans quickly recovered. By the 270s BCE affairs in Italy had been largely resolved in Rome's favor until a new threat arrived from across the Adriatic Sea: Pyrrhus of Epirus, a military leader from western Greece, who invaded Italy and Sicily and showed the Romans that their interests extended overseas. The Romans undertook their first truly overseas wars over Sicily, coming into conflict with Carthage, an African colony of the Phoenicians, in the First Punic War (262–241 BCE). Twenty years of exhausting warfare left Rome supreme over Sicily, Corsica, and Sardinia. The Second Punic War (219–202) began with Hannibal's invasion of Italy and forced Rome to confront Carthaginian allies in Spain, Greece, and Africa. Carthage was reduced to a small powerless city. Rome was now the undisputed master of the western Mediterranean.

In the next century, Rome was forced to engage repeatedly with regional leaders and coalitions. The Battle of Cynoscephalae (197 BCE) and the Battle of Pydna (168) in Greece suggest that Rome's forays were defensive rather than an unmitigated drive for dominance, but the culmination of these campaigns was the sack of Corinth in 146. The destruction of Carthage in the same year was a testimony to Rome's power but not its wisdom; border disputes between the Carthaginians and their African neighbors could have been mitigated by Rome. Spain, parts of Northern Africa, and Greece were now under Roman rule.

This military history mirrors a domestic political flowering that created the Roman republic, a generally lawful system of government in Rome. According to tradition, Rome's first 250 years—from the founding circa 750 BCE to the establishment of the republic in 510—were spent under the rule of seven kings, from the warlike Romulus and his successor Numa, who estab-

lished religious rituals and temples, a calendar, and political institutions, up to a period of three successive Etruscan kings. The last king, Tarquinius Superbus, or Tarquin the Arrogant, was portrayed as an evil degenerate and was driven out by a Roman hero, Brutus. The Romans then established their republic. So go the stories.

The literal truth of these details is less important than the overall truth of Rome's orderly system of self-government. By the early fifth century BCE, the so-called Struggle of the Orders had led the aristocracy to make slow but permanent concessions to the plebeians. The office of tribune was created to represent plebeian interests. The publication of the so-called Twelve Tables of Roman Law in the 450s BCE began a progressive unveiling of the law that resulted in the first truly independent legal profession in the second century BCE. Roman dramatists, such as Plautus and Terence, borrowed from the Greeks and brought a literary and artistic culture to Rome. As the Romans came to dominate the Mediterranean, they made changes to their political institutions, adding offices and dealing with the demands of friends and foes. Increasing territory and population contributed to the growing social tensions that threatened to engulf Rome and its Italian allies.

By the late second century the social and political tensions reached a peak, especially in the matter of land reform. In 133 BCE the tribune Tiberius Gracchus proposed agrarian legislation; vetoed by a fellow tribune, he brought his bill directly to the people, thus bypassing the Senate. An enraged group of senatorial supporters murdered him in the street. By 123 the drama was being replayed when his brother Gaius Gracchus succeeded in establishing boards to take jurisdiction over matters of land. Within a few decades these issues led to a flux of political activity, at times violent. Marius, a plebeian military commander who enjoyed successive consulships, contended with the supporters of Sulla during the years that followed a social war between Rome and its Italian allies. Sulla's dictatorship was strong but not long lasting. It ended in 79, and after a brief political ascendancy by Cicero, Rome by 60 BCE was under the control of a few powerful men with strong factions (the so-called First Triumvirate).

Although the pretense of republican offices was maintained, once Crassus was killed in battle Pompey ruled jointly with Caesar until the latter defeated him in battle and attained sole power. Republican forms remained, but the essence was fading. Historically, Rome had appealed to dictators in the face of desperate situations but for limited durations; Caesar was made dictator beyond the period of any singular emergency. He was murdered in the Senate in 44 BCE, plunging Rome back into chaos, war, and the ascension of Caesar's heir Octavian, acclaimed Augustus in 27 BCE. Any semblance of republican forms was now subordinated to imperial rule.

Roman history from this point can be subdivided in terms of dynastic families. The Julio-Claudian emperors controlled Rome until the death of Nero in 68 CE. After months of civil war the Flavians took power until Domitian was killed in 96 CE. After two years under Nerva—selected by the Senate—the Antonines could boast of generally peaceful successions (by adoption) until the deranged Commodus was killed in 192 CE. Civil war—not seen in three generations—was ended by Septimius Severus and the Severan dynasty. That this was a family of Syrian and African extraction is symptomatic of the decline in importance of the city of Rome itself; the murder of the teenaged Severus Alexander in 235 CE presaged 50 years of de facto military rule, when emperors were chosen by the acclamation of soldiers and when rival claimants settled their ambitions on the battlefield. Diocletian succeeded in bringing the empire back together in the 280s, followed by another struggle after 305 and the rise of Constantine and his neo-Flavian successors. In 385 the death of Theodosius led the Romans to accept the inevitable: the formal division of the empire between his two sons. Over the next century, the west fragmented into early medieval Europe, and the east became the Byzantine empire.

The imperial age of Roman history—if it is a single age—had periods of cultural and intellectual brilliance. The first and second centuries CE were defined by writers such as Vergil, Livy, Horace, Ovid, Seneca, Juvenal, Lucan, and Apuleius. Philosophy was transmitted through various schools. The Stoics, for instance, passed on Greek thought as interpreted by Cicero, through Muso-

nus Rufus (“The Roman Socrates”), the slave Epictetus, and the emperor Marcus Aurelius. Following the Greek Jewish philosopher of Philo of Alexandria, various mergers of Greek philosophy with religious exegesis followed. The last expression of Greek philosophy was Neoplatonism, the product of Plotinus, Porphyry, Iamblichus, and others. Roman law, which mutated in ways consistent with imperial rule, could boast of the *Handbook* of Pomponius, the code of Gaius, the *Quaestiones* of Papinian, and the *Digests* of Ulpian, culminating in the massive compilations completed under the emperors Theodosius and Justinian. With the collapse of paganism, the Christian movement became the dominant cultural force for centuries.

Rome ended politically with the onrush of the barbarians. Various Goths, Vandals, Gauls, and German tribes swept over the borders, and Rome became one city of many, a ghost of its once-glorious past. But it would be erroneous to place the cause of Rome's fall primarily on external challenges. The Roman empire itself was a mix of many cultural influences, united politically but subject to internal dissension, usurpation, and fragmentation. Even Julius Caesar, in the first century BCE, had enrolled Gauls and other non-Romans into his army. The political unity of Rome could not survive the tensions among the values, aspirations, and traditions of its many citizens and subjects. Rather than ask why the Romans selected a “barbarian” emperor in 476 CE, it might be better to ask whether the term had any validity in such a melting pot of contending ethnic and cultural identities.

Roman External Relations

Roman external relations were defined by territorial ambitions and interests on the part of the Roman state at different stages of its development. These relations shifted during Roman history as it evolved from a republican city-state based in Italy and eventually became a vast empire encompassing three continents. Early in the republic, most of Rome's relations were primarily with its Latin, Italic, Greek, and Etruscan neighbors in the Italian peninsula and were focused on guaranteeing its economic health and security in the region. However, Roman military and economic expansion into Europe, the Mediterranean littoral, and the Near East brought the Roman republic (and then the empire after the principate of Augustus) into direct contact and conflict with the Celts (Gauls), the Carthaginians, the Hellenistic kingdoms, and the Parthians, thus expanding its relations from the circumscribed world of the Italian peninsula. Later in the third and fourth centuries CE, in light of its declining military and political strength, the preservation of the Roman empire rested on maintaining friendly relations and alliances with Germanic ethnic groups in its European borderlands, which were characterized by vast German migrations from central Eurasia.

Early in the republic, much of Rome's interaction with local Italian city-states in terms of trade, alliances, and warfare centered on Roman expansion vis-à-vis these entities. Growing Roman preeminence in the central Italian peninsula brought it into direct conflict with other Latin city-states (collectively referred to by historians as the Latin League). Direct military confrontation between Rome and the Latin League in the Latin War ultimately resulted in Roman victory in the Battle of Lake Regillus in 499 BCE. The Latin War ended with a formal treaty (*foedus Cassianus*) that established normal relations between the Romans and the Latin League and created an alliance for collective security. However, this diplomatic maneuver on the part of Rome was in response to the growing threat of migrations of Volsci and Sabines into Roman and Latin areas in the fifth century. Subsequent warfare with the Volsci and the Gauls made the alliance with the Latins pivotal to Italian secu-

➤ HOSTAGE TAKING AS DIPLOMATIC STRATEGY— ROME AND PARTHIA

The exchange of hostages in antiquity as a form of diplomacy created ties between states in an effort to ensure peace. This was particularly evident between Rome and Parthia in late antiquity. Typically, elites from either realm were exchanged and functioned as representatives of their states at the respective courts of their hosts. Frequently these were the younger sons of Roman senators and their equivalents in the Parthian realms. While this was done for relatively short periods of time, it did form a basis for short-term security in terms of diplomatic relations and establishing a level of amiability among these otherwise contentious states. Hostage taking functioned as an example of diplomatic means of resolving international issues and maintaining stability.

—Abraham O. Mendoza

urity. However, in the midst of the Samnite Wars (the Samnites were erstwhile allies of the Romans) the Latin League grew suspicious of Roman hegemony, resulting in a revolt in 340 BCE. Upon the defeat of the Latin League, Rome pursued a policy of incorporating the Latin cities through intermarriage, citizenship, and growing economic bonds, thereby securing their hegemony in Italy. By the end of the Third Samnite War in 290 BCE, they too became incorporated as part of the Roman state, as did the Etruscans and Gauls in subsequent years.

Roman diplomacy shifted onto the great Mediterranean region with the defeat over Epirus in the Pyrrhic Wars and Carthage in the Punic Wars in the third and second centuries BCE. Rome and Carthage had maintained friendly relations prior to the Punic Wars, only insofar as they saw a common enemy in the Greeks and Etruscans. However, with Roman incorporation of these regions, hostility against Carthage in Sicily, Spain, and North Africa resulted in the Punic Wars. In the midst of these wars, Rome garnered support and hostility from adjacent Hellenistic states (some were Carthaginian allies), bringing them into the orbit of Roman national interests. While there were Roman emissaries and what could be construed as diplomats and diplomatic institutions in

the modern sense sent or exchanged with these kingdoms, the actual work of diplomacy was done through the Roman military and bureaucracy following orders from the Senate.

In the second to first centuries BCE, small Greek kingdoms, seeking greater autonomy from the Hellenistic kingdoms (that is, the empire of Alexander the Great and his generals), sought Roman support. Roman intervention in Greek affairs brought them into dynastic intrigues and regional disputes, resulting in Roman military actions against Macedon (200 BCE–197 BCE), Syria (190 BCE), and Greek city-states (particularly illustrative with the Roman sack of Corinth in 146 BCE). Rome gradually incorporated these Greek regions as Roman provinces as they were defeated. Roman acquisition of Pergamum in Asia Minor through the will of its last monarch in 133 BCE granted them substantial territory in the East as well. While friendly relations existed with Ptolemaic Egypt, the last of the great Hellenistic kingdoms, Roman political strife combined with Mark Antony's alliance with Cleopatra also resulted in the conquest of that region by Octavian in 30 BCE.

The Roman empire, particularly during the principate, was a potent force in the ancient Mediterranean world, bringing it into contact with the Parthians in the East and with German cultural groups along its European borderlands. As Rome expanded into Britain, the Levant, and Mesopotamia, it was expedient to rule through client-kings in a form of indirect rule. However, due to revolts such as those in Judea by the Jews (particularly the Zealots) and in Britain by the Icenii in the first century CE, Roman authority was established through the direct incorporation of these regions as Roman provinces subject to direct political and military authority. Relations with Parthia were also characterized by the establishment of formal diplomatic recognition of this Persian kingdom as an equal through the exchange of hostages during times of peace. While wars did characterize this relationship, the inability of either power to force the other to complete capitulation forced this mutual recognition. However, as Rome's military and political power declined in the third and fourth centuries CE, Rome was forced to develop a series of alliances with neighboring Germanic tribal states

along its periphery for mutual defense by allowing Germanic settlement in Roman lands, for Germanic mercenaries, known as *foederati*, were crucial to Roman defense. In the midst of a massive migration of Germanic peoples coming from central Eurasia and exerting pressure on Roman borderlands, it was pivotal for Rome to establish such relationships to counter its weakening military. While some of these Germanic peoples became thoroughly Romanized and adopted Christianity, by the fifth century the Roman empire in the West was no more, having gradually evolved into a series of Germanic successor states. In the East, the Byzantine empire survived for another millennium but through most of its existence as primarily a Greek state based in Anatolia and the Greek peninsula.

The Punic Wars

As the Roman republic solidified its control over the Italian peninsula and began its expansion with the development of colonies in Greek regions in the third century BCE, it entered into proximity with the neighboring regional power of Carthage. Carthage had developed into a major power centered in North Africa and had been established as a Phoenician colony in previous centuries. Initially, Rome and Carthage were allies against their common regional enemies, namely the Etruscans and Greeks in southern Italy. However, as they both developed ambitions in the greater western Mediterranean region, they eventually came into conflict. Through three major wars, Rome and Carthage fought for the control of various Mediterranean regions, namely Sicily, Spain, and North Africa. Ultimately, Rome would

THE PUNIC WARS, 264–146 BCE

destroy Carthage in 146 BCE and emerge as the master of the western Mediterranean world.

Intervention in the internal affairs of Sicily brought both Rome and Carthage into direct conflict in what is known as the First Punic War (264–241 BCE). A Roman alliance with the Greek city of Syracuse, which was engaged in conflict with Greek mercenaries known as the Mammerines after the seizure of the city of Messana, brought Rome into Sicily. This Roman intervention led to greater influence throughout most of the large island. In spite of their friendly relations, Rome could not allow Carthaginian influence in Sicily due to its strategic location in the

central Mediterranean. While the Romans were able to trounce Carthaginian forces decisively in Sicily, they were unable to control the sea, as they lacked adequate naval forces vis-à-vis Carthage. However, the adoption of a drawbridge (known as a *corvus*) that allowed Roman troops to board Carthaginian vessels from their own ships led to Roman naval supremacy. By 241 BCE Rome and Carthage sued for peace with Carthage, agreeing to withdraw from Sicily and to pay Rome a large indemnity. Subsequently, Sicily and Sardinia became Roman territories.

The Second Punic War (218–201 BCE) began as a result of Roman and Carthaginian claims in

➤ WAR ELEPHANTS

As part of his brilliant strategy to engage the Romans in battle in their own homeland, Hannibal brought war elephants along for his Italian campaign in the early stages of the Second Punic War (218–201 BCE). War elephants had also been used by the Persians in their first confrontations against Alexander the Great (331 BCE) and later by the Greek Pyrrhus of Epirus in his struggle against Rome in southern Italy (280 BCE). Other military forces in India, Egypt, and North Africa were also keen on the use of elephants as draft animals for battle in this period. Elephants were also useful in battle, given that they were used in cavalry and their skins were thick enough to fend off attacks by archers and infantry.

—Abraham O. Mendoza

Spain. The town of Saguntum, which Rome claimed as a protectorate, was attacked by Carthaginian general Hannibal in 218 BCE. Hannibal believed that the town was a threat to Carthaginian interests. The Romans argued that an informal agreement banned Carthaginian forces south of the Ebro River, where Saguntum was located. Therefore, this action was seen as an act of war by the Romans and immediately led to the outbreak of war. Hannibal attacked Italy directly by moving his troops through the Alps, thereby bypassing Rome's naval forces in the Mediterranean entirely. En route Hannibal acquired as allies the Gauls, whom the Romans had recently defeated, and was able to engage Roman forces successfully in northern Italy.

Under the dictator Quintus Fabius, Roman forces never openly engaged Hannibal's forces in major battles, instead deploying small raids against the Carthaginian Army. This strategy, known to posterity as Fabian tactics, displeased the Roman public and led to a more aggressive Roman engagement of Carthaginian forces. However, in 216 BCE Roman forces were annihilated by Hannibal's Army at the Battle of Cannae, in which an estimated 70,000 Roman troops were lost. This major defeat also led to the loss of many Roman allies. Hannibal remained in Italy for nearly two decades fighting Roman armies but cut off completely from Africa. The Roman gen-

eral Scipio destroyed the Carthaginian forces coming from Spain to assist Hannibal's Italian Army. Scipio subsequently invaded Carthage's African territories, leading to Hannibal's return. Scipio ultimately defeated Hannibal's Army at the Battle of Zama in 202 BCE, thereby becoming known as Scipio Africanus for conquering Africa.

Following this defeat, Carthage was forced to cede all possessions outside of Africa to Rome and lost its independence in terms of foreign policy. Carthage also had to pay a large yearly tribute to Rome as part of a peace treaty formally ending hostilities. In spite of Carthaginian compliance with these terms, Roman hostility remained throughout the first half of the second century BCE. Cato the Elder supposedly famously stated that "*Carthago delenda est*" ("Carthage must be destroyed"), illustrating how Roman politicians and the public argued that Roman security could not be assured unless Carthage was eliminated. In 151 BCE Roman ally Numidia staged a crisis to provoke Carthage into war and thus allow for Roman intervention. The Third Punic War (151–146 BCE) led to the destruction of Carthage, with its population taken as slaves and its fields razed with salt in 146 BCE. All remaining Carthaginian North African provinces were absorbed by Rome. At this point, Rome was the hegemon of the western Mediterranean littoral.

Jewish Revolts against Roman Rule

As Roman political and military authority increased in Palestine at the expense of local Jewish sovereignty during the first century CE, the resultant Jewish resistance in Judea eventually led to full-scale rebellion. The first Jewish-Roman war, known as the Great Revolt, occurred from 66 to 73 CE in the Roman province of Iudaea (Judea), which included Judea, the remaining core of ancient Israel. The war ended with the disper-

sal of the majority of the Jews (known as the beginning of the Jewish Diaspora) throughout the Roman empire and the destruction of the Second Temple of Jerusalem in 73 CE. The Kitos War, which occurred from 115 to 117 CE, was constituted by various Jewish Diaspora communities in the eastern Mediterranean rebelling against Roman rule, some under Parthian auspices. The third and last major Jewish revolt, known as the Bar Kokhba Revolt, occurred from 132 to 135 on the part of the remaining Jews of Judea as a last-ditch effort to reestablish a Jewish state in Palestine through the ouster of the Romans. Smaller-scale revolts followed in later centuries but were never of the same magnitude.

The Great Revolt began in 66 CE, partly as a result of anger toward Roman disrespect of Jewish religious observances but more as a consequence of long-term Roman infringement on the political autonomy and religious identity of Judea. According to Jewish-Roman historian Josephus, the revolt began after the Roman authorities in Jerusalem ignored Jewish complaints regarding Greek sacrifices in front of a Jewish temple. In reaction, Eliezer bin Hanaina led an attack on the Roman troops stationed in Jerusalem that ultimately ended in a Jewish victory. The Jewish client-kings, who were affiliated with the Romans, subsequently fled the city. Roman reinforcement troops sent from Syria were defeated by Jewish forces at the Battle of Beth Horon. Roman legions under the command of Vespasian were sent by Emperor Nero to pacify Palestine, resulting in the defeat of Jewish resisters in northern Judea.

As the Roman forces neared Jerusalem, killing and enslaving huge numbers of Jews along the way, many Jewish refugees joined the rebellion to preserve their lives from the Roman onslaught. The Zealots and the Sicarii, who were the core factions of the Jewish rebels, also began their own campaign of retribution against Jews allied with or thinking of surrendering to the Romans, thereby igniting a civil war between pro-Roman and anti-Roman factions in Judea. Nonetheless, superior Roman numbers in terms of troops ultimately destroyed Jewish forces with the fall of Jerusalem in 70 CE after a protracted siege of the city by Roman forces. The Second Temple was destroyed by Roman forces,

➤ THE SICARII

In the midst of the civil war in Judea during the Great Revolt against Roman rule from 66 to 73 CE, a faction of Jewish rebels was responsible for the assassinations of pro-Roman Jewish aristocrats. Known as the Sicarii (meaning “daggers”), this subfaction of the greater Zealot movement murdered Roman officials and Jewish sympathizers, who were typically part of the Herodian establishment in Judea, and relied on public stabbings as their trademark. The Sicarii were also responsible for murdering anyone advocating surrender or compliance with Roman authority. Modern scholarship suggests that the Sicarii are an example of what might be termed a terrorist group during antiquity, given that these assassinations were purposely used to give Roman officials and greater Jewish society an example of what happens to collaborators or those who would surrender.

—Abraham O. Mendoza

and large numbers of Jews were exiled or sold into slavery, ending Jewish autonomy under Roman rule. However, remaining Jewish resistance, particularly the Jewish stronghold of Masada, famous for the mass suicide of the defenders, held out until 73 CE.

With the dispersal of the population of Judea, various Jewish diasporic communities developed throughout the Roman empire and in neighboring Parthia. The Kitos War (Rebellion of the Exiled), which constituted a series of Jewish rebellions among various Diasporic communities, began in 115 in reaction to Roman rule. While Roman forces were in the East fighting against Parthia, revolts broke out in Cyrenaica (Libya), Egypt, Cyprus, Judea, and Mesopotamia. Many Jews fought in tandem with the Parthians, preferring their patronage over Roman rule. Ultimately, all these revolts were quashed by Roman forces under the command of Emperor Hadrian in 177 CE. Mass executions and the exile of Jewish survivors was the fate for those captured by the Romans.

The third and final of the major Jewish revolts against Roman authority was the Bar Kokhba Revolt, which occurred from 132 to 135 CE. Emperor Hadrian's promise to rebuild the

city of Jerusalem came with the condition to rebuild it as a Roman city with requisite Roman temples. A new temple, to be built on the ruins of the Second Temple, for the Roman god Jupiter, infuriated the remaining Jews of Judea. Furthermore, Jerusalem was to be refounded as the city of Aelia Capitolina. Hadrian further exacerbated an already tense situation by banning circumcision throughout the empire. Simon bar Kokhba, proclaimed as a Jewish messiah, led Jewish forces against the Roman garrison and was successful in its ouster. This led to a two-year interim whereby an independent Jewish state in Judea existed, given the vacuum of Roman authority. Hadrian sent Roman troops from across the empire to quash this final revolt, which lasted three years. Subsequently, Hadrian attempted to destroy any remnants of Judaism in Judea, which he saw as the root cause of these revolts. The city was reestablished as Aelia Capitolina, with remaining Jews further scattered, sold into slavery, or killed, all on a far larger scale than in punitive acts during or after prior revolts. The core of the remnant Jewish community in Palestine made Galilee its cultural and religious center, while Jewish Diasporic communities thrived elsewhere in eastern Europe, Mesopotamia, and the Mediterranean littoral in later centuries.

Parthian Imperialism

The Parthians, a confederation of tribes, probably of Scythian origin, inhabiting the area between the Hari Rud River and the Caspian Sea (with a center near modern Ashkhabad), united under a king named Arsaces and rebelled against Greek rule around 238 BCE. Arsacid kings would hold various parts of Iran for some 400 years,

but they constitute the most obscure period in all of Iran's history. No Parthian historical records, if they bothered to keep any, have survived, and the dynasty that replaced them had little interest in recording their accomplishments. Consequently, most information about them comes from classical sources, which give a distorted view in that they deal almost exclusively with the wars between the Parthians and the Greeks and Romans.

Parthian rule was mostly confined to eastern Iran until the decline of the Seleucids, under increasing pressure from the Romans, following the death of Antiochus IV Epiphanes. About 155 BCE, an Arsacid king, Mithridates I, moved into western Iran and, in 141, captured the most important city in Mesopotamia, Seleucia on the Tigris. A crushing defeat of the Roman Army led by Crassus at the Battle of Carrhae in 53 BCE confirmed the position of the Parthians as a major power in southwest Asia and the chief rival of Rome. Roman armies had great difficulty dealing with the Parthian use of light and heavy cavalry as well as their tactics of feigned retreat and massive volleys of arrows launched from horseback. Marc Antony continued to skirmish with the Parthians; Augustus negotiated a peace and the return of the legionary standards captured at Carrhae. Subsequent campaigns against the Parthians took place under Nero (55–63), Trajan (115–117), Marcus Aurelius (163–165), and Septimius Severus (194–198). Much less is known about Parthian relations with their neighbors to the east, but contacts with the Han Chinese and the Kushans seem to have been extensive and generally amicable.

Politically and culturally, the Parthian empire was remarkably decentralized and diverse. Discrete areas were under the direct rule of the king, but most of the territory was controlled on his behalf by aristocratic warrior families, vassal kings, relatives, and local governors. According to traditional accounts, there were, as in the Achaemenid period, seven of the great feudal families (vazorgan). They held large provinces and maintained their own armies of freemen (azadan), which provided service to the Arsacid monarch as necessary. Among the most famous of these families were the Suren of Sistan, the Mehran of the central Elburz, and the Karen of Media.

FORMATION AND DECLINE OF THE PARTHIAN EMPIRE

Classical authors emphasize the pride Parthian rulers took in being regarded as philhellenes, and they do seem to have been quite comfortable with Greek culture. Up to the middle of the first century CE, they used Greek and Greek characters for their inscriptions and coinage; they did, however, have their own language and script, and it eventually appeared on coins, ostraca, and other material. Insofar as there was a Parthian literature, it was largely if not completely oral. Parthian bards and minstrels were responsible for preserving the cycles of stories about epic heroes so important in the east Iranian tradition. In much later centuries, these were written down in the Iranian national epic immortalized by the poet Ferdowsi and in popular romances such as the story of the star-crossed lovers *Vis and Ramin*.

➤ PARTHIAN TOLERATION

The Parthians certainly tolerated various religions: the mystery cults, Christianity, and Buddhism all had adherents in the Parthian empire. The Parthians themselves may have blended elements of Hellenistic religion with Iranian ones. In general, however, they must have followed some form of Zoroastrianism since they maintained fire temples and practiced exposure of the dead; they are also credited in later tradition with having started a compilation of the Avesta.

The Origins of the Sassanids

In the early third century CE, the Parthian empire, beset by both internal problems and endemic warfare with Rome to the west and Kushans to the east, allowed the Sassanids to

► SASSANID EMPIRE—CROSSROADS OF LATE ANTIQUITY

Much as the Parthians before them, the Sassanids continued to maintain its position as the conduit of international trade that existed between the Roman empire to the west and China and India to the east. The Sassanid empire maintained significant commercial relationships with all these states and ensured the stability of the Silk Roads within its territorial domain. Furthermore, merchants carried their native religions (i.e., Christianity, Zoroastrianism, Buddhism) along these trade routes. As the crossroads of late antiquity, the Sassanids held a considerable amount of influence on cultural and economic diffusion during the period of its existence.

—*Abraham O. Mendoza*

assume the mantle of power in the Persian realms. The Sassanids, based in Persepolis, were a family of hereditary Zoroastrian high priests who led a rebellion against Parthian rule in 220 CE. Under the leadership of Ardashir, the Sassanids rapidly expanded their control of the southern Iranian plateau and subsequently acquired Babylonia and Media as Parthian power disintegrated. By 227 Parthian rule was essentially removed, with the Sassanids effectively assuming the levers of power.

Sassanid ascendancy was met by Roman opposition, given that Rome had a vested interest in preventing the existence of an aggressive Persian state. This led Rome to subsidize and support Armenian intervention against the Sassanids under the leadership of Chosroes I. Chosroes secured support from Romans, Albanians, and Georgians and engaged Sassanid forces. However, Ardashir proved successful in destroying this Armenian-led coalition through a series of successful military engagements. By 228 the Armenians were left alone to confront the Sassanids as they lost Roman, Kushan, and Scythian support. However, Armenia was able to resist a successful incursion by Sassanid forces and thus maintain its sovereignty after reconciliation with the Romans.

In retaliation for Roman support for Armenian aggression, Ardashir's Sassanid forces seized

Roman Mesopotamia in 230. His forces were able to quickly overrun the province due to scant Roman resistance in the region and were soon on the border of Roman Syria. Roman diplomacy under Emperor Severus Alexander immediately quelled further aggression by the Sassanids. However, peace between the Romans and the Sassanids was not long lived, and within a year Severus Alexander was amassing Roman legions from across the empire to recover Mesopotamia. Roman forces were able to attack the Sassanid empire along three fronts in Mesopotamia but were unsuccessful in defeating Persian forces and recovering the province. Roman defeat left the Armenians on their own to face the Sassanids, who now viewed them as a dangerous ally of Rome within striking distance of the Persian heartland. Upon the death of Chosroes, the Armenian state was unable to resist Sassanid military incursions and was effectively annexed, thereby establishing a new boundary with Rome to the west.

Following the rapid expansion of Sassanid power and the removal of the Roman threat at least for the time being, Ardashir went to work in consolidating his territorial gains and establishing his authority throughout the provinces. The vast Parthian empire that the Sassanids now effectively controlled encompassed many of the lands of the former Achaemenian empire of Cyrus the Great. Under the Sassanids, Zoroastrianism was instituted as the state religion of the entire realm. Ardashir viewed Zoroastrianism as a means to create a more cohesive unity of the empire and to solidify state authority. Other religions in the empire would suffer marginalization and periods of persecution by Sassanid authorities. Nonetheless, the Jewish religion thrived in Babylonia under Sassanid auspices.

Through much of the remainder of the third century, the Sassanid empire continued to face external threats on its western and eastern borders. In the west, Roman and Sassanid forces continued to vie for control of the Levant, ensuring endemic warfare among them with intervals of peace. In the east, the Sassanids faced the Kushans and the Bactrians whom the Sassanids were able to defeat and force into accepting Sassanid hegemony. Nonetheless, the Sassanids continued to face Roman and later Byzantine military

power to the west for several centuries more, until finally succumbing to Arab Muslim armies in the mid-seventh century.

The Mauryan Empire

In 330 BCE, Alexander the Great, king of Macedonia, defeated and killed Darius III of Iran. Alexander and his army then headed east through Iran to northwestern India, which had been conquered by the Iranians almost 200 years earlier. Alexander reached Indian Punjab, but when his army threatened to mutiny, he withdrew. A man named Chandragupta Maurya, and his Brahmin advisor who is called Kautilya, Chanakya, or Vishnugupta, apparently took advantage of the disorder that followed the Macedonian withdrawal to seize territory in Punjab. From this base, they moved eastward, and, about 325 or 321 BCE, defeated the king of Magadha. Chandragupta founded the Mauryan dynasty of Magadha. In 305 BCE, he seems to have defeated Seleucus Nicator, a Greek general who had made himself king of Syria and Iran after Alexander's death, and added parts of Afghanistan to his dominions.

Chandragupta ruled Magadha until about 297 BCE, when his son Bindusara became king. Bindusara probably conquered territory in the vast Deccan plateau of peninsular India (the modern states of Maharashtra, Karnataka, and Andhra Pradesh). He died about 272 BCE. The next king was his son Aśoka, one of the greatest monarchs in the history of India. Thanks to the conquests of previous kings of Magadha, Aśoka ruled a huge empire, extending from Afghanistan to Karnataka, and from Gujarat to Kalinga on the Bay of Bengal, even if he did not (as is sometimes said) rule the whole subcontinent. Kalinga played a pivotal role in Aśoka's life, as

SOURCES ON MAURYA HISTORY

Besides Aśoka's inscriptions, we have two major sources of information about Mauryan India. One is the fragments of a book by Megasthenes, a Greek ambassador to Chandragupta's court. The other source is a Sanskrit book called *Arthashastra*, which is said to have been written by Chandragupta's adviser Kautilya. The existing version of *Arthashastra* was edited 500 years after Kautilya's time, but many scholars believe it contains passages by Kautilya, along with later additions. Kautilya supposedly wrote *Arthashastra* to show Chandragupta how to rule Magadha. The book contains information on Mauryan government, although it is unclear how much of it is what Kautilya (or later authors) wanted and how far it reflects the way things really were. In any case, *Arthashastra* describes a centralized administration, under the personal control of the king. It recommends that the king have secret agents all over the country, both to detect dissent and to keep in touch with the people. Whether this was actually done or not, we know that Aśoka ruled through a large body of paid bureaucrats.

—*John McLeod*

eight years after he became king, he subjugated the region in a bloody war. Aśoka claimed to have been transformed by remorse over the loss of life in Kalinga. Whether he really was or not, he apparently became a Buddhist and adopted a new ethical system in his administration.

Aśoka was the first known ruler in South Asia to set up inscriptions, texts carved in stone and publicly displayed. His inscriptions, which are found all over India, include a pillar at Sarnath, where Buddha is said to have preached his first sermon. Its capital bears sculpted lions, which have been adopted as a symbol of modern India. Thanks to his inscriptions, we know more about Aśoka than any previous Indian king. The inscriptions suggest that Aśoka was a devout Buddhist. But despite what has sometimes been said, Aśoka's personal Buddhist beliefs seem to have been distinct from the ethical policy that he adopted after the Kalinga war. He used the Prakrit word *dhamma* for this policy, which called on his people to make kindness to other living

things the guiding principle of their lives. He led the way by providing medical care for humans and animals, planting fruit trees along the sides of roads to give shade and food, and becoming a partial vegetarian. It is likely that the policy of dhamma agreed with Aśoka's own beliefs, but it was also politically useful: the king probably hoped it would bridge the many divisions (religious, linguistic, economic, cultural) among his subjects with an ideology that almost everyone could accept, all under his leadership.

The majority of the population of Mauryan India was rural. As they do today, peasants lived in villages near their fields. Their main food crops were wheat and barley in the north, rice in the Gangetic plain, and millet in dryer areas (such as the Deccan). From before the time of the Mauryas, the principal tax in India was the land revenue, later called the *lagaan*, which was collected at a rate of between one sixth and one third the value of the crop.

By the time of Chandragupta, cities existed in the old Aryan world of north India, and probably also in the Deccan. Elsewhere, the Mauryas may have established new cities, for by the end of the dynasty, urban settlements existed in all parts of India except the extreme south. Nevertheless, outside of the Gangetic plain, Mauryan cities fall into distinct clusters. These were apparently separated from one another by regions inhabited by Tribals, where the Mauryas may have only controlled the roads linking the urbanized areas.

Cities were centers for administration, manufacturing, and commerce. Mauryan India had an extensive trade with the Mediterranean world. Its significance is shown by the fact that Indians called all foreign merchants *Yavanas*, Greeks. Merchants had used writing for several centuries before the accession of Aśoka, and it was now employed by the government as well. The language of administration was Magadhi, the Prakrit spoken in Magadha. There is little evidence that Sanskrit was written before Mauryan times, but *Arthashastra* is in Sanskrit, and it is difficult to believe that it was handed down orally. This suggests that Brahmins like Kautilya now wrote in Sanskrit, most likely in the Brahmi script that was already used for Prakrits.

The greatest Mauryan city was the capital, Pataliputra, in the modern state of Bihar. In Pat-

aliputra, archaeologists have found a pillared hall, apparently built by Chandragupta, which is the oldest known stone building in India. In keeping with his Buddhist leanings, Aśoka built at Buddhist holy places. The Mauryan period seems to mark the beginning of Buddhist construction in permanent materials.

Aśoka died about 235 BCE. The Mauryan empire began to disintegrate almost immediately, showing that dhamma was insufficient to hold together so vast a territory. The decline has been connected with economic decay, poor communications, problems in managing the bureaucracy, or war. About 185 BCE, the last Mauryan king of Magadha was overthrown, but the Mauryas had played a key role in the development of South Asia. By bringing Gangetic civilization to more of India than ever before, they created lasting cultural and economic ties over much of the country, particularly among the urban areas. India was politically divided after the death of Aśoka, but cities and the Gangetic civilization (which now becomes Classical Indian civilization) continued to spread, and trade grew steadily.

The Qin and Han Chinese Empires

China during the Eastern Zhou period was chaotic and divided. Ultimately, a rival state named Qin (pronounced “cheen”) prevailed militarily over all other states and unified China under its rule in 221 BCE. The Qin then imposed its name

► THE MARTIAL EMPEROR

Wudi (who came to power in 147 BCE), the greatest Han emperor, was also surely one of the most important emperors in Chinese history. A strong-willed ruler with passionately held opinions, he aggressively pursued his program for increasing China's greatness. Internally, he wanted to break the power of the merchants who were amassing huge fortunes. Fearing that the merchants' enormous wealth might eventually lead to subversive political ambition, he forbade them to purchase land and took other steps to stop their participation in land speculation and landlordism. He established exclusive government rights to the production and distribution of essential commodities such as salt and iron. His official government monopolies over salt and iron enabled him to sell these commodities at artificially high prices, thus driving salt and iron merchants out of business and guaranteeing the

government a steady stream of tax revenue. Wudi also launched a very aggressive campaign against the Xiongnu who lived along China's northern borders in the steppes and constantly attacked China for material advantage. His warfare against them led to the expansion of China's borders and to the eventual submission of the Xiongnu, although not during his lifetime. Wudi also ruled during a time of great cultural efflorescence. He was the emperor who made Confucian thought China's official state ideology, and during his reign he sought to foster Confucian education for government employees. The great Chinese historian Sima Qian wrote the first comprehensive history of China during this time. Han power declined after the death of Wudi, and his successors were mostly mediocre men who lacked vision and the instinct to govern effectively.

—David Curtis Wright

on the rest of China, and it is from "Qin" that we get our term "China" in English and also the various pronunciations of "China" in many other European languages.

Several factors contributed to the Qin victory. Geography played an important role; the Qin was relatively isolated in western China from the rest of the states. The Qin was a rugged, semifrontier region located in the very fertile valley of the Wei River, a tributary of the Yellow River. The Qin's natural geography made it easy to defend but very difficult to capture, which also worked to the Qin's advantage. Because most of the great battles during the Eastern Zhou were fought in other areas of China, the Qin escaped with its economy and polity relatively unscathed.

The Qin government was also an aggressive recruiter of administrative and military talent. The Qin early on saw the value of Legalists and the political ideology they espoused and promoted, and the Qin more than any other state in China actively recruited them into government service. Legalist advisers helped the Qin transform itself from a feudal government to a highly centralized, unitary state. The Qin stripped feudal lords of their land and allowed common peasants to use it. This may seem like a positive

and progressive step for the Qin to take, but the Qin, of course, did not do it for completely altruistic reasons. Like the feudal governments it was dismantling, the Qin government financed itself largely through agricultural taxation. What distinguished the Qin from feudal governments was that the Qin wanted all of the tax revenue from agriculture and was unwilling to share a portion of it with any feudal hierarchy.

Legalist advisers reduced all formerly feudal regional and local governments to levels of the central government. The Qin largely abolished the system of hereditary nobility because it considered it a potential threat, and in its place it instituted an administrative system staffed by people who had proven their fitness for leadership by their tangible accomplishments. Commoners who proved themselves competent in civilian or military spheres were promoted and rewarded; incompetent aristocrats in military or civilian leadership were dismissed from their posts and deprived of their salaries. What mattered to the Qin was individual merit, not family background or bloodline. In other words, the Qin transformed itself from an aristocracy to a meritocracy. To protect this new centralized meritocracy from challenges from within, the Qin accepted the Legalists' advice and instituted

a system of mutual surveillance and responsibility on the local level. It also handsomely rewarded informers.

The Qin was undone and overthrown because of the very Legalist ideology that had helped establish it in the first place. In retrospect, it seems that the main contribution of Legalism and the Qin state that applied it was the unification of China and the creation of a structural model for future dynastic governments. Legalism as an ideology was later abandoned during the Han dynasty.

Two great rebel alliances emerged, and by 206 the Qin was deposed and its capital city sacked. China was well rid of a harsh dynasty and totalitarian government. By 210 BCE, the Qin's subjects had been pushed to the limits of their endurance. There followed a four-year civil war between the two rebel alliances, one under the leadership of Xiang Yu, an aristocrat from one of the powerful states before the Qin unification, and Liu Bang, a coarse and unrefined commoner who had risen to military leadership by dint of his native intelligence, resourcefulness, and widespread popular appeal. Liu Bang was originally under Xiang Yu's command but broke away from him because he disagreed with Xiang Yu's military tactics and found him to be unnecessarily cruel and vengeful toward the Qin. The two commanders eventually came into conflict, and in 202 BCE a dramatic and decisive clash, celebrated ever since in Chinese literature, ended with Liu Bang's triumph and Xiang Yu's suicide.

In 202 BCE Liu Bang became the founding emperor of the Han dynasty, a regime that endured until 220 CE with one brief interruption, which occurred during the life of Christ. Liu Bang was one of only two commoners in Chinese history ever to found a major dynasty. (Zhu Yuanzhang, the founder of the Ming dynasty in 1368 CE, was the only other.) He had the common touch and exuded the common man's sense of decency and fair play, and for this the Chinese have loved him ever since.

He is remembered for understanding the importance of relying on competent and educated men for advice and expertise in government and for ameliorating some of the harshest Qin ex-

cesses. As a commoner, Liu Bang had considerable instinctive sympathy for the ordinary peasant and took measures to relieve his plight. He reduced the agricultural tax rate from over one-half the crop to one-fifteenth and also reduced the number of capital offenses. General peace and prosperity characterized his reign and the reigns of his immediate successors, and the Chinese people were finally able to rest after centuries of turmoil and suffering. China's population exploded between 200 and 150 BCE, and the economy grew by leaps and bounds. A brief domestic revolt broke out in 154 BCE, but it was quickly quelled. These were quiet and content decades.

It is possible to give Liu Bang too much credit for the positive aspects of his reign. After all, he never faced the monumental task of unifying China; the Qin, for all of its totalitarian excesses, had accomplished that. He could well afford to reduce the tax rates because he never had to fund the enormous armies necessary for achieving national unity. Neither did he have to break the power of the feudal ruling class and invent an effective governmental structure and administrative framework; credit for those belongs, once again, to the Qin. The Han was built upon Qin foundations and took much of the credit, and very little of the blame, for what the Qin had accomplished. In retrospect it is quite apparent that the Qin's contributions to China were unity and imperial order. Once this had been accomplished, the dynasty had outlived its usefulness and was ready to be overthrown by a fundamentally different regime. While the Qin was Legalist in its ideology, the Han eventually proclaimed its Confucian orientation. The ideological difference showed up in the different policies pursued by the two dynasties.

Qin and Han External Relations

The foreign policies of both the Qin and Han dynasties centered on securing the northern frontier. The Qin aggressively pushed the border deep into the steppe, while the Han had to deal with the powerful pastoral nomadic Xiongnu empire and its successors. It did so through a variety of measures, including war, peace treaties, wall building, diplomatic alliances, and co-option. None of these measures had lasting success, but diplomacy and war eventually led to contact with western Asia and the Chinese takeover of the Tarim basin.

In 215 BCE the Qin general Meng Tian conquered all the territory south of the Yellow River, thereby displacing the Xiongnu people. The Qin then erected long walls north of the Yellow River to enclose the area. In response, a charismatic leader named Modun unified the Xiongnu into a state headed by a hereditary leader known as the Shanyu. In 198 BCE, to stop Xiongnu incursions, Emperor Gaozu (r. 206–194) personally led an army to the frontier. In short order, the Xiongnu soundly defeated and surrounded Gaozu and his army.

After this terrible calamity, the Han government sued for peace and signed a number of peace treaties, which are known as the Heqin (harmony through kinship) policy. In exchange for peace, the Han government recognized the Xiongnu state as a diplomatic equal; gave a Chinese princess in marriage to the Shanyu; furnished annual payments in silk, wine, and grain; and opened border markets. Nevertheless, this appeasement policy never truly ended Xiongnu raids.

Emperor Han Wudi (r. 140–87 BCE) decided to aggressively deal with the Xiongnu through war and diplomacy. Using large cavalry expeditions that struck deep into the steppe, he pushed the Xiongnu north of the Gobi Desert. In the conquered areas, he erected long walls and beacon towers to protect the Han's gains. At the same time, to deprive the enemy of the Tarim basin's resources, the Han government sent military expeditions to subdue and control that region's oasis cities.

This beacon tower in Dunhuang in Gansu province was erected during the Western Han to warn China of Xiongnu movements along the border. (Panorama Media Beijing Ltd.)

This western expansion also came as a result of the Chinese search for allies against the Xiongnu. In 139 BCE Emperor Wu sent Zhang Qian to the far northwest to enlist the help of the Yuezhi people. Although Zhang was unsuccessful in doing so, he returned with an extensive knowledge of central Asia's peoples and conditions. By 101 BCE the Han had militarily defeated the kingdom of Ferghana (in present-day Kirghizstan), which brought all the other Tarim basin oasis cities to heel. This victory secured Chinese control of the eastern end of the Silk Roads.

The Han also tried to turn the tide by letting surrendered pastoral nomads resettle within China's borders along the frontiers. They were allowed to keep their leaders and were encouraged to follow their traditional pastoral nomadic lifestyle. In exchange, they served in the Chinese military against other steppe people; this was called using barbarians to fight against barbarians. Unfortunately, due in large part to

exploitation by frontier officials, these resettled steppe people often rebelled, frequently in league with Chinese who lived in the frontier zone.

Chinese rulers also tried to entice steppe leaders into submission through the tributary system. Due to the pressure of the Chinese attacks and a succession crisis that caused civil war, in 51 BCE Huhanye, the Shanyu of the Southern Xiongnu, came to Chang'an to pay tribute to the Han emperor. Even though Huhanye became the throne's vassal, he was amply rewarded with gold, silk, cash, clothing, grain, and autonomy.

Fall of the Eastern Han

The fall of the Eastern Han in 220 CE was the result of several factors. The first was that toward the end of the dynasty the land of the nation had been monopolized by only a few large landowners, which inevitably led to the serious problem that millions of peasants lost their land and had to be either attached to the big landowners or become destitute and homeless. Peasants, the traditional smallholders, were the main source of tax and therefore the foundation of governmental finance. Toward the end of the Eastern Han, the situation became so desperate that the emperor had to collect money by selling ranks and official positions; meanwhile, a large homeless population that had once been taxpayers became a big threat to the security of the government.

Second, the continuous war against the Qiang people in the empire's western border

(in Liangzhou) not only worsened its financial condition but also intensified the social conflicts. Finally, the Liangzhou insurge developed into an allied rebellion against the central government by both the Qiang and the Han people living in that area. While the Qiang insurge dragged the Han government into a mire of war lasting more than three decades in its western border, the Yellow Ribbon Rebellion destroyed the empire from the inside. The violence, carried out mainly by the peasants who had lost their land and become destitute and homeless, swept most of the provinces in the central Plain area, the Yellow River drainage, and Yangtze Valley, which not only drained government finances but also paralyzed the imperial governance.

Third, since the reign of Emperor He, various factions had arisen among the literati, eunuchs, and the families of the empresses, who vied for dynastic power. From Emperor He to the last emperor of the Eastern Han, the emperors all dealt with a situation in which they had to rely on the families of the empresses at court because they were too young to exert imperial power when they were elevated to the throne. However, when the young emperors grew up and realized that they were under the control of their maternal relatives, they often attempted to make changes, usually with the help of the eunuchs who served the emperors with great loyalty. Consequently, imperial power was abused as one clique fought against another and was inevitably weakened during the battles between the eunuchs and the emperors' powerful maternal relatives.

At last, accompanying the increasing wealth and power was the greater independence of the local powerful families. The tensions between the royal family and local powerful families existed from the beginning of the Eastern Han dynasty (25 CE), but the first three kings were able to control the powerful families by marriage or other means, preventing them from achieving independence. Such a balance was gradually broken when the young emperors had to concentrate themselves on their struggles for the power that should have been in their own control. As a result, the same force that supported

the founding father to establish the Eastern Han dynasty buried the dynasty 200 years later. When Cao Cao, a member of the powerful Cao family, was able to smash other local warlords supported by local big families in northern China, he actually prepared the way for his son Cao Pi to usurp the Han royal power. On December 11, 220, Cao Pi was enthroned, and the Eastern Han dynasty faded out of history.

Nomadic Confederations and Conflicts on the Steppes

The Xiongnu, Yuezhi, and Sakas (Scythians) were nomadic peoples who lived in the steppe areas northwest of China during the latter half of the first millennium BCE. This area stretched from contemporary Mongolia into the western regions of China's Xinjiang Province, which further connected to central and western Eurasia and is generally referred to as the steppes. The steppe lands have provided migratory connections for all peoples living in Eurasia for millennia. Generally, civilizations are seen as separate entities with their own identities, but the history of the Xiongnu, Yuezhi, and Sakas (Scythians) gives us a window on how ethnic identities have changed depending on migratory and political conditions on the steppes. The Xiongnu lived in the steppe north of China during the second century BCE through the second century CE and were a strong nomadic confederation led by a single ruler—the Shanyu—who needed to trade with sedentary civilizations, such as China, for merchandise unavailable to their nomadic economy. This trade served dual

purposes by providing the steppe nomads with access to luxury goods, which were distributed to the nomadic elites while keeping border raiding down to a minimum.

Also during this time (second century BCE) China emerged as a united empire under the short-lived Qin dynasty, which was later succeeded by the Han dynasty, but regardless of which dynasty ruled the newly unified China, horses were needed for the Imperial Calvary as well as other trade items that came across the northwestern frontiers. The nature of relations between China and the northern steppe nomads was a perpetual problem of war or peace—raiding or trading—for the entirety of China's history until the Qing (Manchu) dynasty, which was the last dynasty to rule China (1644–1911). It is important to understand that China's long history has been one of interactions, sometimes peaceful, sometimes warring with their nomadic neighbors to the north. These interactions with Eurasia's steppes were not secondary to China's history but instead were quite the opposite; they were central to China's existence and development. From the preunified period to the dynastic era of a united China (second century BCE) the ruling dynasties had to contend with well-organized nomadic confederations on their northern borders. These nomadic confederations controlled territories known to us as the Silk Roads and served as a link between the eastern and western lands of Eurasia. In those early centuries the Silk Roads could have been called the horse or jade road, as those were the major commodities desired by the Qin and Han dynasties. The history of united China did not start as an isolated unit on the eastern extreme of Eurasia; it began with interactive relations between nomadic and sedentary societies and continued in connection with migrations and interactions from peoples living in the steppe borderlands.

First and foremost among the steppe's nomadic confederations during the second century BCE was the Xiongnu, which is preserved in the accords of China's historians from the period. Indeed, many of the names for the nomads are recorded by the literate sedentary civilizations (Chinese, Indian, and Greek), as the nomads of

this time did not leave any written records for posterity to interpret and directly understand the nature of nomadic life.

What scholars know about the steppe confederations is largely limited to Chinese sources. The very name “Xiongnu” originates on the Chinese side, as do surviving descriptions of nomadic lifestyles. Scholars do not have Xiongnu sources to illustrate their perspective, nor do we know how they referred to themselves, as the name “Xiongnu” is of Chinese origin. It was the sedentary Chinese civilization that defined and named many nomadic peoples’ identities for posterity. The Xiongnu were a confederation of many social groups, some of whom may not have shared a common language but nevertheless were united under the banner of one leader called the Shanyu. The Xiongnu were able to challenge and threaten the Chinese empire to get what they wanted, largely bolts of silk and other goods unavailable in the northern borderlands. Under the Qin and Han dynasties, China could not defeat the nomads and instead had to

develop methods to placate them. There had been a tradition of wall building among the individual Chinese states before they were forcefully united under the Qin emperor. However, once unification occurred in the second century BCE, the Qin emperor built a new wall system stretching across most of northern China. This tradition of wall building was passed to the succeeding Han dynasty, which assumed an aggressive posture attempting to defeat the Xiongnu once and for all. It was at this point in their relations with the northern nomads that the Han thought it advantageous to garner support among steppe rivals to defeat the Xiongnu. It is here where the Yuezhi emerge onto the historical stage as they began a journey that eventually changed where they lived and how they were identified.

The Yuezhi were another confederation of steppe nomads who lived south of the Xiongnu and traded with Chinese dynasties. The Yuezhi also fought the Xiongnu and lost, so they did what nomads historically have always done: the

Yuezhi retreated to lands south of the expanding Xiongnu Confederacy, eventually deciding to migrate west away from perpetual risk of conflict. At some point during the second century BCE the Yuezhi began migrating west toward central Asia; it was during this time that the Han dynasty sent an emissary to find and secure an alliance with the Yuezhi against the increasingly powerful Xiongnu Confederation. This proved difficult because the Chinese emissary first had to find the Yuezhi before engaging any negotiations for an alliance. As nomads, neither the Yuezhi nor Xiongnu had fixed locations for the Chinese diplomatic mission to easily locate, so the Chinese diplomats traveled in the general direction of areas where they knew the Yuezhi pastured their animals and hoped for the best. As luck would have it, the Han envoy Zhang Qian did not reach his objective, as he was captured by the Xiongnu and spent the next decade as their “guest.” After nearly 10 to 15 years Zhang Qian escaped, along with his new Xiongnu family, and found his way back to China. Eventually the Chinese made contact with the Yuezhi in the western lands and tried to persuade them to return as allies of the Han dynasty in their struggle against the Xiongnu. The Yuezhi declined the Chinese offer and thus ended attempts by the Han to forge a nomad-sedentary alliance to counter the growing threat of the Xiongnu Confederacy.

However, the story of the Yuezhi does not end here. It was a rather usual occurrence on the steppe for one nomadic group to push another group away, which in turn usually displaced other groups, a pattern of behavior on the steppe that fostered east-to-west migrations across Eurasia for thousands of years. What was unusual during this time was the attempt by the Han dynasty to forge an alliance with one nomadic society in the hopes of positioning it against the powerful Xiongnu. However, no alliance with the Yuezhi ever materialized. Instead, the Yuezhi embraced a familiar nomadic strategy by migrating to the western lands to escape conflict with the Xiongnu, which in turn created conditions for a remarkable transition for the Yuezhi. By the first century CE the Yuezhi had migrated from the steppes of northern

China into central Asia, eventually leaving their nomadic life. Some branches became the sedentary trading societies of the Tocharians, and others became the Kushans in the lands northwest of India. In short, the Yuezhi migrated and eventually settled in the areas of modern-day Uzbekistan, Kyrgyzstan, and Afghanistan. During the first century CE the former Yuezhi were known as the Kushan Kingdom, which was a major central Asian trading civilization that served as a nexus for Eurasian-wide commercial and cultural interactions. The transformation from pastoral nomads on the northwestern steppes of China in the second century BCE to a sedentary civilization that served as a hub of trade and cultural activities is a poignant example for understanding how identities change during the course of mass migrations.

In a similar migration pattern, it is believed that the Scythians, also known as the Sakas, made an earlier migration from the steppes north of China into the area of contemporary Afghanistan, Iran, and Ukraine. Many early accounts of the Sakas (Scythians) come from ancient historians and modern paleoanthropologists, but the Sakas vanished from the historical record as they eventually blended with the sedentary civilizations of central Eurasia. Therefore, nomadic peoples who once lived in the steppes north of China would in a matter of several centuries become sedentary Tocharian merchants and Kushan kings, no longer keeping their Yuezhi or Saka identities. In this way, identity, language, and lifestyle changed as a result of migrations and interactions between settled and nomadic peoples in the heartland of Eurasia.

■ Introduction: Captains and Common Soldiers

From 1000 BCE to 300 CE, the standing and social position of soldiers changed dramatically in many parts of the world. In the Near East prior to this, soldiering and military service were done as an obligation, like paying taxes, and the bulk of the obligation was felt by the poorer classes. Yet this does not seem to have been the case in much of the world from 1000 BCE to 300 CE, as the ability to be a soldier, in many cases, was seen as a marker of nobility or citizenship. In the Greek city-states, for example, the armies consisted of the citizens of those states, the individuals responsible for governing their cities, and the individuals with the most rights and powers. Many historians see democracy as a development that went hand in hand with military service in the Greek world. Similarly, the professional soldiers of the Roman empire were well respected, and as Roman rule expanded throughout Europe, veterans were settled in these new regions, becoming the most influential citizens in those new centers and the bearers of Roman culture in new lands. In India and China military service was related directly to class, in China associated with the aristocracy and in India with a new caste, the Kshatriyas. In Celtic Europe and in the Americas, the warrior was a figure of honor and respect

within the communities and held a privileged position within those societies.

However, it is not the common soldiers who lived from 1000 BCE to 300 CE who capture the imaginations of historians today so much as their ancient captains. This is the period of Alexander the Great of Macedon and Hannibal the Great of Carthage, renowned for their daring military exploits and especially the distances with which they led their armies. These figures were idolized and feared and, in Alexander's case, even deified. Their tactics are still studied by military scholars today.

—Kevin M. McGeough

Development of the Hoplite Structure

A shift in ancient Greek social and political organization resulted in the emergence of the hoplite military structure, which represented the land-owning classes with a stake in society, replacing the aristocratic military caste that preceded it. The Greek Dark Ages (1200–1800 BCE) had been characterized by horse-mounted warriors representing the wealthier strata of Greek society. The hoplite reform that emerged at the end of this period resulted in the inclusion of citizen-farmers of the evolving city-states, which while granting political representation also required military obligations for the defense of the state. The hoplite structure also created new tactical military strategies exemplified by the phalanx.

For 300 years, between approximately 650 and 350 BCE, the hoplite military structure dominated the Greek world. During this period, no other military tactic was able to engage the Greek phalanx effectively. The phalanx consisted of a close formation of heavily armed warriors, characterized by their round shields known as *hoplons*. They also carried a long spear, usually as long as the height of the soldier. In terms of armor, they would have a breastplate, which made them vulnerable at the neck and at the groin. It did not provide any protection for the back. Hoplites would also have greaves to protect their legs,

► THE SALPINX IN HOPLITE WARFARE

In the chaos of warfare in classical Greece, the lack of ability to hear and the limitations of headgear on sight made battle communications difficult. Bronze helmets severely limited the ability of hoplites to see and hear due to small openings for the eyes and none for the ears. The hoplites were only able to see directly in front of them with no peripheral vision. The *salpinx* was an instrument used in Greek battles to overcome these obstacles to communications in the midst of battles. This instrument, similar to the modern trumpet, was characterized by a narrow cylindrical tube with a bell and was composed mainly of bronze. It was utilized by making loud distinctive sounds that served as military calls.

—Abraham O. Mendoza

from their kneecaps to their ankles. A Corinthian helmet would cover most of their face but would allow limited eyesight for close combat. Leather padding would create a level of protection for the hoplite, but a strong enough impact could still cause considerable bodily harm.

The main difference between the hoplite phalanx and previous and subsequent military procedures in ancient Greek tactical formations is the efficient combination of military service with the civilian sense of duty to the nation-state. The inclusive and egalitarian nature of the phalanx placed friends, family, and locals fighting for the defense of the community and for *esprit de corps*. Rather than reliance on a caste of elites fighting in a small-scale engagement, the phalanx pitted citizen-soldiers from one polis (city-state) against another. The auxiliary forces in the form of archers and skirmishers were typically formed from the lower strata of the city-states and did not command much respect in the hoplite ranks.

Distinctive military traditions emerged as a result of the development of the hoplite organization. Among the most famous example is the city-state of Sparta, renowned for the military prowess and the lifelong commitment of its hoplites. Young boys would enter military training at the age of five and carry on in military life past middle age. The spirit of fighting for the honor and glory not only of the city-state but also for family honor was important for Spartans. The weight of the armor necessitated Spartans to maintain a proper physique, which resulted in intense physical preparedness in the form of gymnastics and an intense exercise regime. Strength and agility were necessary to be able to carry heavy armor while engaging in battle. Other Greek city-states maintained comparable rituals to those of the Spartans in regard to physical preparedness.

The Military Career of Alexander the Great

Alexander the Great of Macedon (356–323 BCE) became one of the greatest generals in world history as a result of his ability to raise and lead a vast composite army into Asia and North Africa, unifying the eastern Mediterranean and the Near Eastern worlds under the aegis of Greek civilization. The trajectory of his military career began as a subaltern commander under his father Philip II of Macedon in his efforts to conquer the Greek peninsula from Athenian and Spartan dominance. Upon his father's death in 336 BCE, Alexander assumed command of the Macedonian and Greek armies and continued eastward, conquering the Achaemenid Persian empire well into the central Asian borderlands of India. His military advances and tactical alliances in the Mediterranean and Near Eastern regions exemplified not only his daring but also his strategic genius and diplomatic nuance, all of which characterized Alexander's legacy in the expansion of the Hellenistic world of the fourth century BCE.

In the midst of Greek power struggles among Athens, Sparta, and Thebes in the mid-fourth century BCE, Macedon was emerging as a significant player in the region. Macedon was allied to Thebes and as such had a vested interest in the affairs of the Greek peninsula. Ultimately, Macedon defeated the Athenians and Thebans in the Battle of Chaeronea in 338 BCE, with young Alexander at the helm of the Macedonian cavalry. Macedonian hegemony in Greece was established by the League of Corinth, instituted to legitimize Greek autonomy under Macedonian tutelage. When his father Philip II was assassinated in 336 BCE, young Alexander rapidly succeeded as Macedonian king and as commander of the military forces of the realm. Initially, Alexander consolidated Macedonian rule within the newly acquired Greek domains. Furthermore, he also sought to secure the northern borders along Illyria and Thrace while continuing to quell Greek revolts against his rule.

Having consolidated his rule in the Balkan Peninsula, Alexander the Great decided to conquer the Achaemenid empire of the Near East, which had been his father's goal. In 334 BCE

➤ BACTRIA

The region of Bactria, which was in the borderlands of Persia and India along the Hindu Kush Mountains, was conquered by Alexander before his turn to India. After Alexander's death, the region developed a syncretic culture that typified its position as a borderland between the Hellenistic and Indian worlds. Bactria succeeded in throwing off the yoke of Seleucid rule in 255 BCE and securing control of vast portions of central Asia at the expense of both the Greeks and the Indians. While eventually succumbing to foreign rule by India, Bactrians did retain various Greek characteristics in their culture, mostly represented in coins and art that lasted for centuries, thereby illustrating the far-reaching influence of Hellenistic culture that Alexander had aspired to in his expansion east.

—Abraham O. Mendoza

Alexander led a force of 37,000 troops, an ethnically diverse army composed of Greeks and Macedonians, among others, into West and central Asia. He left a significantly large force under Antipater, one of his most trusted generals, to ensure stability at home. Later that year, Alexander met the Persian Army at the Battle of Granicus and soundly defeated them. By 333 BCE Alexander had smashed the Persian Army directly under the leadership of Darius III at the Battle of the Issos River. Subsequently, Alexander conquered Syria, Palestine, and Egypt. In Egypt, he was proclaimed pharaoh and thus divine, securing the support of the Egyptian elite as a legitimate ruler. He also founded the city of Alexandria, which later became an intellectual beacon of the Hellenistic and Roman worlds.

By 331 BCE Alexander was actively campaigning in Mesopotamia, defeating Persian forces at the Battle of Gaugamela and occupying the ancient capital of Babylon. When Darius was assassinated by a usurper, known as Bessos, Alexander proclaimed himself the rightful heir to the Persian throne to gain local legitimacy. By 329 BCE his forces promptly defeated the remaining Persian forces and ensured regional stability by allowing local control under Greek rule. In 327 he entered Sogdiana (modern Afghanistan) and married a native princess, Roxana, to secure diplo-

matic recognition as well as legitimacy of his rule. He advocated intermarriage between his military leaders and that of local elite women as a way to promote ethnic integration throughout his domains. While he was in fact able to secure victories along the periphery of India, his men mutinied due to the fact that they had been campaigning for years, and Alexander subsequently returned to Babylon to consolidate his gains. While he desired to create a multiethnic consolidated empire infused with Greek culture under Macedonian rule, his death in 323 BCE prevented this, as his domains quickly fragmented into multiple Hellenistic successor kingdoms under the rule of his myriad military leaders.

Cult of Alexander

The deification of Alexander the Great (356–323 BCE) is illustrative of his attempts to solidify his imperial conquests into a cohesive political unit under his rule. His recognition of the diverse elements of his massive conquests throughout the Mediterranean world and well into central Asia, in terms of ethnicities, religions, and geographical regions, made him privy to the belief systems of subject people and thus able to use them as a means of Hellenic hegemony. This concept was easily adaptable in regions such as Egypt, where people recognized their monarch, the pharaoh, as a deity. The Hellenistic ruler cult created by Alexander the Great, who in his short but significant reign was able to rule over much of the known Mediterranean world, brought about an important change in the concept of kingship, one that emphasized that kings were incarnations of gods. The cult of the ruler created by

Alexander would set a precedent taken up by later rulers in antiquity who claimed that the monarch was a god.

During his conquest of Egypt in 332 BCE Alexander had been addressed as pharaoh, which was a title reserved for Egypt's kings regarded as divinities. While in Egypt he visited the oracle of Amon in the city of Siwa. During this visit, the local priest of the oracle acknowledged Alexander as the son of Amon, regarded as the equivalent of the Greek Zeus and considered the chief god of Egypt. This recognition of Alexander as the son of a god gave him a great degree of credibility by the locals. There is some debate among historians as to whether he truly believed he was a god or saw this as an opportunity to rally political support among subjugated populations.

This supposed equivalency of Alexander with gods, conferring on him a status as a deity, did not go over well among some city-states back in Greece. His demands in 324 BCE to be considered a god were highly controversial and ultimately ineffective. The concept of divinity in Greece still rested upon the distinction of gods and mortals, which did not grant mortals any of the same qualities reserved for gods. While individuals were recognized with honors akin to gods, usually posthumously, they ultimately remained mortals.

Alexander proved to be more successful elsewhere during his campaigns in the East. The belief of his divinity accorded with local belief systems and strengthened his ability to advocate for political rule over lands far from Macedon and Greece. In the city of Alexandria, he created his own cult without the trappings of being related to existing deities. His supposed slaying of a giant snake and the resulting shrine added to his prestige as the namesake of the new city. In this instance, he was able to capitalize on this myth that surrounded him as the founder of the city. A foundation myth for ancient cities, such as that of Romulus and Remus in Rome, typically created deity status for political leaders in civic religions.

Alexander's Hellenistic successor kingdoms would attempt to create the same sort of relationship between the office of the king and that of the deity. The inclusion of statues of kings in temples, the recognition of the king as a civic god, or the growing adhesion of some priests to create the myth of the king were attempts by

➤ ALEXANDER THE GREAT AT THE TEMPLE OF AMON IN EGYPT

Alexander the Great is hailed as the son of Amon at the Temple of Amon at Siwa, Egypt, in 331 BCE. As the new ruler of Egypt, Alexander was considered a living deity or "pharaoh." (Ridpath, John Clark. Ridpath's History of the World, 1901)

When Alexander's army entered Egypt, he was greeted as a liberator, freeing Egypt from Persian rule. There, Alexander adopted the ideology of Egyptian kingship and came to be understood as a living deity, as the pharaoh traditionally was. After being deified, Alexander used this as a tactic to solidify his political rule over subject peoples. This idea was also adopted by his successors in the Hellenistic kingdoms.

—Abraham O. Mendoza

Hellenistic monarchs to further legitimize their political rule. The development of the mystery religions during the Hellenistic period, with their focus on the individual, did much to buttress the development of the cult around the god-king. The savior gods of these sects could be easily related to the current Hellenistic king in power. In later centuries, Roman emperors and medieval kings would utilize similar tactics to legitimize their rule by claiming to be gods or holding the office of king through divine right.

Hannibal the Great

Carthaginian general and political leader Hannibal (248–183 BCE) is perhaps more famous for crossing the Alps with war elephants than for sustaining his armies in the heartland of his Roman enemies for more than a decade during the Second Punic War (218–201 BCE), even while lacking supplies and reinforcements from Carthage. Much is known of his exploits due to the works of Greek historian Polybius (203–120 BCE) and Roman historian Livy (59 BCE–17 CE), who both chronicled Hannibal's military expeditions and cultivated his myth. Hannibal's military prowess led to the defeat of the Roman legions in the Battle of Lake Trasimene (217 BCE) and the even more famous Battle of Cannae (216 BCE), which were two major blows to the powerful Roman republic in terms of strategic and manpower losses. While his military career is marked by legendary successes, strategic decisions by Roman generals and his inability to secure logistical support from home

doomed any progress made on his overall strategy to annihilate Roman power on the Italian peninsula.

Hannibal was born in 248 BCE in the midst of the First Punic War and came of age as his father, General Hamilcar Barca, began Carthaginian expansion into the Iberian Peninsula. Upon his father's death, Hannibal was made into a military officer serving under his brother-in-law Hasdrubal. Hannibal served in Iberia, where he gained valuable military experience in the Carthaginian conquest of the Iberian peoples. Hasdrubal sought a conciliatory approach in his Iberian policy, even arranging a treaty with Rome promising not to expand north of the Ebro River. However, when Hasdrubal was assassinated in 221 BCE, Hannibal was made military commander of Carthaginian forces in Spain, and he embarked on a more aggressive expansionist foreign policy vis-à-vis Iberia and Rome. Roman apprehension of Carthaginian expansion led them to make the city of Saguntum (modern Spanish city of Sagunto), south of the Ebro River, a Roman protectorate. Hannibal viewed Roman designs on Saguntum as a violation of Hasdrubal's treaty and subsequently sacked it in 219 BCE. Roman outrage and Carthaginian support for this action led to the Second Punic War.

The Second Punic War was characterized primarily by Hannibal's invasion of the Italian peninsula, not from the Mediterranean as would be expected but instead by a land invasion from Spain through the Pyrenees and Alps and down to the Po Valley in Italy. Moreover, Hannibal's armies were composed not only of Carthaginians but also of Numidians, Libyans, Iberians, and Gauls, which made it a truly multiethnic military force. According to ancient historians Polybius and Livy, the treacherous terrain and weather of the Alps led to the death of vast numbers of Hannibal's soldiers and pack animals, among them many of his famous war elephants. Along the way, he also encountered resistance by Iberian and Gallic peoples, some of whom ultimately joined forces with Carthage against the common enemy of Rome. Entering northern Italy, Hannibal also succeeded in securing an alliance with Italian peoples wary of Roman hegemony.

Hannibal's military leadership led to a series of major victories against the Romans during the

➤ SCIPIO AFRICANUS—THE ROMAN HANNIBAL

Scipio Africanus (236–183 BCE) was a Roman general and politician during the Second Punic War and was known for his defeat of Hannibal at the Battle of Zama. Scipio is portrayed in Roman history as the antithesis to Hannibal, as his ultimate foil. Amid the series of defeats that Rome had suffered at the hands of Hannibal's Carthaginian forces in Italy, Scipio attacked the Carthaginian North Africa homeland, forcing Carthage to recall Hannibal. At the Battle of Zama in 202 BCE Scipio crushed Hannibal's forces, thereby ensuring the defeat of Carthage and ending the Second Punic War. Subsequently, Scipio was given the name Africanus in honor of his victory in North Africa. He was mythologized as a near-mythical Roman hero who defeated the alleged invincible Hannibal.

—Abraham O. Mendoza

nearly 15 years he spent in Italy. The Battle of Trebia (218 BCE) allowed him to deal the first blow to Roman forces in Italy and secure the alliance of local disaffected Gauls. At the Battle of Lake Trasimene (217 BCE), Hannibal forced the bulk of the Roman Army into a major battle, resulting in a significant defeat for Rome and the loss of many of its Italian allies. Subsequently, the Romans avoided a pitched battle with the Carthaginian forces, advocating delay tactics (known as the Fabian strategy, named after the military commander Fabius Maximus). However, this tactic was seen as cowardly by the Roman leadership and the populace, who advocated a more aggressive strategy. This resulted in the ruinous Battle of Cannae (216 BCE) in which Roman forces were annihilated by inferior Carthaginian numbers by Hannibal's tactical genius. An estimated range of 50,000 to 70,000 Roman soldiers were either killed or captured, which was catastrophic in terms of its impact on Roman manpower. However, Hannibal failed to follow up on his victory. He neither destroyed the remnants of Roman forces nor sacked Rome due to his lack of reinforcement and supply. After that, Rome resumed a Fabian strategy in terms of confronting Hannibal's forces in Italy, who were already cut off from their supply base in Spain and North Africa and had to live off the land or through the auspices of their Italian allies. The Romans also pursued a scorched earth policy, burning crops and preventing the Carthaginians from securing food from the Italian countryside. While Hannibal did win minor victories in Italy, he was never again able to secure a major victory against Rome and thus lingered in the Roman countryside fighting a war of attrition without any hope of North African or Spanish logistical support.

After 15 years of wandering around Italy, Hannibal was recalled to North Africa to defend his homeland from a Roman invasion in 203 BCE. Attempts to secure a peace treaty by both powers proved illusory, and fighting continued. At the Battle of Zama (202 BCE) in North Africa, Hannibal's forces were crushed by the Romans, thereby ending his invincibility myth and ensuring Roman victory.

After the Second Punic War, Hannibal remained a powerful figure in Carthaginian poli-

tics regardless of his declining popularity as a soldier. However, Rome eventually demanded his surrender, forcing him into exile first to Tyre and then to the court of Antiochus III of Syria. In Syria, Hannibal served as a military adviser for the Seleucids, again plotting against Rome yet ultimately defeated again by Roman forces in 190 BCE. Hearing that Antiochus might hand him over to Rome, Hannibal again sought exile, this time in Bithynia. Unwilling to fall into Roman hands, he committed suicide by consuming poison in 183 BCE upon hearing that his Bithynian hosts were handing him over to Rome.

Roman Military Careers after the Reforms of Augustus

The Roman emperor Augustus (r. 31 BCE–14 CE) had extensive experience dealing with the men in the military, dating back to 44 BCE. He knew how to entice them and how to keep them happy, and he knew what displeased them. He had experienced enough mutinies to understand their causes. With this knowledge, he was able to implement wide-ranging reforms to the army. By 13 BCE, Augustus had created Rome's first professional army. No longer would temporary armies be created to deal with temporary threats. Each of the 28 legions had 5,500 men plus cavalry reinforced by a similar number of auxiliary units. Altogether, there would be a permanent standing force of about 300,000 men. These men would serve for defined periods of time. Originally, the term called for 16 years of

➤ PRAETORIAN GUARD

The Praetorian Guard represented another important element in Augustus's efforts to control the army. Since 44 BCE, he had made use of elite units, not only the Praetorian Guard but also foreign cavalry, such as his German bodyguards. He knew how important these units were to maintaining control of his camp and protecting him against attack. It should be no surprise that he would keep these units once in control of the empire. The Praetorian Guard was raised to 9,000 men and stationed around central Italy. Guardsmen would be paid double the salary of the average soldier (1,800 sesterces rather than 900), would have shorter tours of duty (16 years active service followed by four years in reserve, rather than 20 and 5), and would be given nearly twice the retirement bonus (20,000

to 12,000 sesterces) and/or more land. The purpose of the imperial guards was the same as that of the republican guards: to protect the emperor and to help him control the other soldiers. Stationed in Italy, they would be entirely separate from the rest of the legions. This meant they would be unaffected by any mutinous movements in the frontier legions and then could be used by Augustus against rebellious troops. Despite their small numbers, these separate, loyal, elite units could be used to overawe regular legionnaires and to support a besieged general. The guards also allowed Augustus to control Rome and potential rivals in the capital. In short, they provided him with the necessary power to run the empire.

—Stefan G. Chrissanthos

active service followed by four years in reserve. Those periods were extended in 6 CE to 20 and 5. The key to this system of enticing volunteers and keeping soldiers happy while performing a difficult job was, of course, money. During the republic, problems with money, including irregular pay, unfair or infrequent distribution of plunder, and dissatisfaction with discharge bonuses of cash and land, often led to mutiny.

Thanks in large part to the wealth of Egypt, Augustus was able to make significant economic improvements to military service. He provided pay of 900 sesterces, the same amount distributed by Caesar, which was itself a doubling of the previous stipend provided by the state. This pay would be distributed regularly and would not be subject to the whim of a general or the senatorial government. This was important because republican soldiers often did not receive pay in a timely fashion. Though the pay was not extravagant, the key to the system was the retirement benefits. Augustus provided either a cash bonus or land or both to men who had served their time. It seems that after 13 BCE, men received, instead of land, 12,000 sesterces, or about 12 years' pay. Estimates vary, but possibly as many as 200,000 men received benefits during the first three decades of Augustus's reign. These included mass discharges in 30–28 and 14 BCE. To cover all these expenditures, Au-

gustus established the *aerarium militare* (military treasury) in 6 CE. To help fund this treasury, Augustus donated his own money and later imposed sales and inheritance taxes.

These economic reforms, at least for much of Augustus's reign, helped keep the soldiers happy (or happy enough), removing one important cause of rebellion. The soldiers knew that if they remained loyal, the emperor and the state would provide for them. The soldiers now became defenders of the status quo. At least for the time being, mutinous officers could not use money as an incentive to spark a rebellion. At the same time the Augustan system was attempting to keep the men happy, it also encouraged divisions among the rank and file to prevent rebellion. The new, professional nature of the military led to a definite hierarchy among the regular soldiers.

Keeping the average soldier happy was only the first step. The second step involved the centurions. Thanks to his civil war experiences, Augustus realized the importance of the centurion in the chain of command. He had to do everything he could to bind these men closer to the state and to himself and at the same time worked to separate them in certain ways from the average soldier. Men became centurions on the basis of their military and leadership qualities, and certainly also of their loyalty to the regime. They inspired

great respect among the men, unlike higher officers, who were often political appointees. As such, the centurions were crucial in a commander's control of the camp and were the backbone of the army, vital for its continued discipline. They could act as an early warning system; since they were close to the men, they would know if any problems developed. Without their support, it would be nearly impossible for a commander to regain control and punish his men.

During the republic, the centurions did not always remain loyal to their commanders. Instead, they shared many of the grievances of the men and therefore often took a leadership role in these rebellions or remained neutral and allowed a mutiny to spread without acting to quell it or reporting it to superiors. Augustus's system, in contrast, dramatically increased the status and wealth of the centurions through increased pay and retirement bonuses; it also increased their opportunities to rise up within the army and offered greater opportunities after discharge. Centurions' pay was raised to between 5 times (for an ordinary centurion) and 20 times (for the *primus pilus*) the average soldier's pay.

More money meant more separation between the centurion and the men, despite their similar origins. They also now had the opportunity to rise into the Praetorian Guard, which enjoyed better conditions of service in the capital and higher pay. They could rise through the ranks to become military tribunes or even camp prefects. The *primus pilus* was now granted equestrian status at discharge. This represented a huge opportunity for social mobility. No longer would a centurion join a mutiny and risk his future; he simply had too much to lose. The centurions were now in a privileged position and were therefore willing to defend Augustus's government, which guaranteed their newfound wealth and status.

A chasm opened up between the centurions and their former comrades. Though he did rise from the ranks, a centurion would no longer feel the same strong kinship with the men. Conversely, the soldiers no longer believed that their centurions shared their views or grievances. Instead, many soldiers now disliked their centurions, not least because of their role as the camp disciplinarians. Augustus's reforms, which included increased pay and discharge bonuses and

numerous opportunities for social advancement, had successfully created a gulf between the men and the centurions, separating the centurions from the ranks from which they sprang while binding them to the princeps.

Augustus's reforms were also designed to control his generals and officers. By 14 CE, there were nine military provinces in which legions were stationed. Because of Augustus's greater imperium, all were subordinate and ultimately responsible to him, and none governed in his own right on his own independent authority. They were rarely allowed to remain in one place for any length of time. Instead, they were moved from province to province at the discretion of the princeps. The obvious purpose of this policy was to discourage the development of loyalty among a governor, his soldiers, and the provincials. Last, but definitely not least, these men were chosen not only for their competence but also for their reliability and their close relationships, sometimes very close, with Augustus and other members of the royal family.

The distribution and dispersion of legions and the proliferation of commanders and officers served Augustus's purposes. There were so many commanders and so many subordinate officers that each could provide a check on the others; mutiny would be very difficult because numerous officers in numerous different camps would have to join an uprising to mount a credible threat, and with so many people involved in different locales, the chances of detection would be much greater. Commanding officers were no longer in a position to acquire the wealth and military glory independent of Augustus that could be used to challenge his authority or sap the loyalty of the men to him.

Development of the Warrior Caste—Kshatriyas, in India

The Kshatriya varna or warrior division of ancient Indian society was the source of many rajas or Indian kings and led to the emergence of the world's largest classical empire in India. Classical Indian and Mediterranean sources indicate that the Kshatriyas emerged with the blending of Indus (Harrapan) civilization and migrating Aryan tribes by 1000 BCE. Later classical Indian literature indicates just how pervasive and powerful the warrior class became as identity makers of India involved in king making, militarism, and the formation of regional *jatis*, or castes.

South Asia's first known civilization, the Harrapan, existed in the Indus River drainages between 2500 and 1500 BCE. By 1900 BCE Harrapan civilization was in decline, possibly due to environmental changes. Their script remains undeciphered, so the presence of a military class is unknown. The resulting power vacuum was filled over the next few centuries by migrating cattle and horse tribes from Asia, referred to as Aryans (nobles). Over 40 Aryan tribes recorded their deeds in oral verses eventually written down in Sanskrit in the first millennium BCE as the Vedic epics. Aryan chariot warriors armed with bows helped priestly leaders spread nomadic cattle culture into agricul-

tural India proper, with its large population. These two groups emerged as the Brahmins and Kshatriyas. The Aryan tribes fought among each other and overran the indigenous Dasas, as evidenced in the Vedic epics and the *Mahabharata*, eventually spreading influence into southern India and the island of Sri Lanka, as written in the *Ramayana*. These epics all indicate conflict and cooperation between the civilizations that resulted in a four-division society across northern India by 500 BCE. Both varnas and color castes needed each other to gain and maintain power among the large populations of agricultural societies of India. Both held power over the Vaishya (merchant) and Shudra (labor) varnas as well as untouchables outside any division. It was in this system that the Kshatriya Siddhuarta Guatama (Buddha) developed the movement leading to Buddhism. Kshatriyas eventually cut across Hindu and Buddhist civilizations by incorporating invading warrior groups, local populations, and lower varna members with martial skills. The challenge to Kshatriya power from the priestly and merchant varnas led to a subculture of Kshatriyas so successful that most kings of India were drawn from it and not from the other castes.

Later classical works from India and from visitors of the Greco-Roman world indicate that Kshatriyas were associated specifically with elite weapons and fighting units, had their own special marriage and training laws, held most command positions, and became the source for most Indian rajas. Mahapadma, born of a Shudra mother, formed the Nanda dynasty at Pataliputra at the time Alexander was invading northwestern India in the fourth century BCE. Kshatriya Chandragupta Maurya, following the ideas of Brahmin Kautalya, formed the Mauryan empire from a takeover of Nanda and Greek territories. India's first empire and the world's largest classical military force and capital city at Pataliputra had all emerged with direct impetus from the Kshatriya warrior caste. By 100 BCE this varna proved so adaptable to internal and external threats that it remained the primary defender and absorber of power changes in India for the next millennium.

—Christopher Howell

➤ PROBLEMS OF CLASSICAL WRITTEN SOURCES

The history of India is difficult to find from written sources. Most sources no longer exist, are undecipherable, or survive as filtered fragments copied by later writers. Though the Harappan civilization (2500–1500 BCE) had a written system, it remains undeciphered. The Aryan tribes only wrote down oral hymns hundreds of years afterward, and few of those initial writings on perishable materials survive. Only a few stone carvings and metal tablets remain even from the Mauryan empire. Classical Greco-Roman and Chinese sources have the same problems and survive only as fragments of lost works (Megasthenes, as an example) referenced by other Classical and post-Classical writers.

The Celtic Cult of the Warrior

Organized violence was a constant feature of Celtic societies. Because most people were engaged in farming or herding, the trained fighting men constituted a social elite that not only protected the people, farmland, and herds but also came to play a central role in Celtic culture. The importance of the warrior is evident not only from the care and skill lavished upon his weapons and armor but also from literary evidence, both Celtic and classical. Warriors were expected to live lives that were extraordinary for their daring and bravery, especially in battle. Their finely honed skills were reinforced by their belief in divine protection, symbolized by the nearly circular metal torque they wore around their necks and that can be seen in artistic depictions. Though the evidence is scant, it seems clear that within their communities the warriors had most of their needs met by the willing labor of the lower classes. In return, the heroes were expected to treat their social inferiors well and not arrogantly.

The warrior on the battlefield comes alive in the rather late Irish legends like the *Tain Bo Cualnge* and the pages of Greek and Roman observers from the third century BCE to the third century CE. He has long, perhaps elaborately braided hair and probably wears little more than trousers. A long iron slashing sword hangs from a chain at his belt, and he wields a number of spears and a shield of wood and leather or bronze. He may fight from horseback or a chariot or war cart from which he might descend to fight or from which he may hurl his spears while a driver maneuvers. They did not fight in formations like the Greeks or Romans and seemed to have little in the way of battlefield organization or even lead-

FROM THE IRISH EPIC *TÁIN BÓ CUALNGE*

"Ferdiad came with them [to fight the hero Cu-chullain] for the sake of his own honor . . . forasmuch as he deemed it better to fall by the shafts of valor and bravery and skill, than to fall by the shafts of satire, abuse and reproach. And when Ferdiad was come into the camp . . . he was honored and waited on, and choice, well-flavored strong liquor was poured out for him till he became drunken and merry. . . . Great rewards were promised him if he would make the fight and combat . . . [namely] a chariot worth four times seven bondmaids, and the apparel of two men and ten men, of cloth of every color, and the equivalent of the Plain of Murthemne of the rich Plain of Ai . . . free of tribute . . . without duress for his son, or for his grandson, or for his great-grandson, till the end of time and existence."

Sacrificed Captives among the Peoples of the Americas

The activity of sacrificing captives in the ancient Americas during 1000–300 BCE can be inferred from archaeological evidence. The Western Hemisphere peoples' (Americas) emphasis on

Stone sculpture of a figure emerging from a niche holding a baby or a jaguar-like god from the Olmec settlement of La Venta in present-day Mexico. Half-human and half-jaguar beings were often depicted in Olmec art. It is believed the Olmec equated shamans with jaguars. (Ruben Charles)

sacrificing human captives is related to religious-cosmological beliefs in universal life cycles. Specifically, gods had sacrificed to create humans, and reciprocity was called for to keep the universal cycles in balance. Both agricultural and nomadic societies from the period 1000 BCE to 300 CE have left evidence in the form of human remains, artifacts, and images suggesting human war-captive sacrifice, usually of rival elite groups and warriors. In peacetime, internal cultural sacrifices of families including children took place, often associated with catastrophic events such as droughts and evidenced in sacrificial burials at sacred locations such as caves or wells. However, it is the wartime sacrifice of captives, often associated with early monumental architecture, that is best documented. This was a practice that had parallels in most major early civilizations around the globe.

In North America the moundbuilding cultures such as the Adena and Hopewell (500 BCE–700 CE) may have sacrificed small groups at effigy mounds such as the Great Serpent Mound, where headless burials are located near stone knives found at the mouth of the mound. A number of North American monumental archi-

tecture sites such as Poverty Point in Louisiana and early Hohokam and Pueblo sites in the U.S. Southwest have human bone fragments associated with them, but interpretation remains ambiguous, highlighting the difficulties of identifying human captive sacrifice in the archaeological record.

In Middle America (Mesoamerica) the Olmec culture (1500–300 BCE) may have sacrificed children with certain jaguar traits based on imagery and burial evidence. The Zapotec culture and its city-state of Monte Alban (500 BCE–900 CE) show evidence of human captive sacrifice on architectural reliefs known as *danzantes* (dancers). Early Maya culture sites (500 BCE–300 CE) also contain such evidence and human sacrifices of elite war captives. In peacetime, families, including children, were sacrificed during high stress events such as starvation episodes, but their status as captives is unclear. Later Classic Maya city-states (300 CE–1000 CE) also contain evidence of both wartime and peacetime sacrifices. Maya evidence of human sacrifice in the Mesoamerican Classic period is prolific and is found on ceramic vase imagery, in murals at sites such as Bonampak, in stone sculptures, in burials, and in Mayan glyphs. The giant city-state of Teotihuacan (0–650 CE) in central Mexico has captive sacrifice events associated with architectural constructions including some in which hundreds of captives were sacrificed.

In South America the Casma Valley and the Sechin Alto complex (2000–500 BCE) provide early iconographic and burial evidence of large-scale human sacrifice associated with monumental architecture. Moche culture (100 BCE–700 CE) of the coastal Andean region has evidence of human war captive sacrifice on three-dimensional ceramics, architectural reliefs, sacrificial knives, and burials. War captives from adjacent regions were captured and sacrificed en masse in a religious ritual at earth-brick pyramid sites.

■ Introduction: Practicing Peace

Although it may seem like a modern conception, antiwar sentiments are probably as old as warfare itself. From 1000 BCE to 300 CE, calls for peaceful action and critiques of warfare appeared in the Classical literature of Greece and Rome, in early Christian writings, and in the practices of new South and East Asian religions and belief systems. The reasons for desiring peace and criticizing war vary, but all condemn the destructive power of war. Undoubtedly antiwar sentiments were prevalent in other places and expressed in other ways. These are merely the types of expressions that have been preserved in a manner that historians have access to. The following entries explore some of the different ways in which peace was practiced from 1000 BCE to 300 CE.

—Kevin M. McGeough

Antiwar Thought in Classical Athens

The Greek city-states too often found that what divided them was more important than what united them, and as a result war was a constant feature of life. The Peloponnesian War, fought by Athens and Sparta from 431 to 404 BCE, was particularly brutal, however, and reasonable citizens began questioning the wisdom of continuing it. One factor was that the war was being promoted by Athenian democrats, whereas their oligarchic or aristocratic political opponents were more sympathetic to Sparta. A further issue was that as the war dragged on, atrocities against civilians became more common. In one especially vicious incident in 415 BCE, the Athenians captured the island of Melos, which had been neutral, slaughtered all the men, and enslaved the women and children.

Several of Aristophanes' comedies reflect the uneasiness that many Athenians felt about the war. The *Acharnians* (425 BCE) depicts the efforts of Dikaïopolis, an Athenian citizen whose farm has been damaged by the invading Spartans and who had fought for his city-state, to make a private, separate peace with the Spartans. This

was, some may have argued, a selfish decision, but others would have agreed that it was a rational response to an irrational world. Even more escapist is Aristophanes' comedy *Peace* (421 BCE) in which an Athenian named Trygaeos climbs on a giant dung beetle in order to fly off and rescue the goddess Peace. Similarly, in the *Birds* (414 BCE) a pair of Athenians leave their native city in order to establish an alternative city-state among the birds. The play is more utopian than explicitly antiwar, but it reflects the discontent that Athenians felt in those years.

Most important is Aristophanes' *Lysistrata* (411 BCE). It is not disgruntled Athenian men but a woman, Lysistrata, who organizes opposition to the war. Her technique for bringing it to an end is, in the world of this comedy, effective. The women of Greece (she has collaborated with women in Sparta and Thebes) will refuse to have sexual relations with their husbands until the war is over. At the same time, the women seize and blockade the Acropolis, where the Athenian state treasury was located. They succeed and bring about the end of the Peloponnesian War. It was impossible for women to participate in Athenian politics with the directness that Lysistrata did, yet with many men away at war and with widowed women becoming more conspicuous over the years, women were probably playing a larger role in public life than they had before the war.

The darker side of the war was on display in Euripides' works. The plots of many of his tragedies were drawn from the myth of the Trojan War, and it came to be an analogue to the Peloponnesian War. The *Trojan Women* (415 BCE) was about the mistreatment of captured Trojan women after Troy had fallen, and it is difficult to read it without thinking of the enslavement of the Melians during the previous year. The play does not explicitly call for an end to the Peloponnesian War, but the vivid dramatization of the cost of war must have caused many Athenians to reconsider the course of the war. Euripides' *Hecuba* (ca. 424 BCE), about the postdefeat fate of the widow of Troy's king Priam, would have had a similar sobering effect.

—Kenneth Rothwell

► LYSISTRATA: ANCIENT PEACE ACTIVIST

In this speech, Aristophanes's character of Lysistrata chastises the Athenians and the Spartans, who had been fighting one another in the Peloponnesian War for 20 years, for failing to resolve their differences. She reminds them that they had been allies. In circa 463 BC the Athenians, under the general Kimon, sent an infantry force to Sparta to assist it in the wake of a slave revolt. The Spartans had intervened in 510 BC to overthrow the Athenian tyrant Hippias, paving the way for democracy.

I'm female, yes, but still I've got a brain.
I'm not so badly off for judgment, either.
My father and some other elders, too,
have given me a first-rate education.
In no uncertain terms, I must reproach you,
both sides, and rightly. Don't you share a cup
at common altars, for common gods, like brothers,
at the Olympic games, Thermopyli and Delphi?
I needn't list the many, many others.
The world is full of foreigners you could fight,
but it's Greek men and cities you destroy!
And that's the first reproach I have for you. . . .

Now, Spartans, my next reproach is aimed at you.
You must remember, not so long ago,
you sent a man to Athens begging us,

on bended knee and whiter than a ghost,
to send an army? All your slaves were up
in arms when that big earthquake hit you.
We sent you help, four thousand infantry,
a force that saved your entire country for you.
And now you pay the Athenians back by ravaging
their country, after all they did for yours? . . .

Do you Athenians think I'll let you off?
You must remember, not so long ago,
when you wore rags, oppressed by tyranny,
and Spartans routed the army of occupation,
destroying the tyrant's men and all his allies,
and drove them out on a single glorious day,
and set you free, and then replaced your rags
with clothes befitting democratic people? . . .

Considering all these mutual benefactions,
why prosecute the war and make more trouble?
Why not make peace? What keeps you still apart?

—Kenneth Rothwell

Early Christian Antiwar Responses

Early Christian antiwar responses were inspired by the doctrines of Christianity as outlined in the New Testament. The Gospels contain the teachings of Jesus of Nazareth, whose message was one of peace and loving one's neighbors and enemies. Among Jesus's many sayings concerning peace, the most direct are from Matthew

5:44 and Luke 6:27. Both encourage Christians to love their enemies. The apostle Paul continued this message of peace in his letters, and many other early Christian figures, including Tertullian, Origen, and the military martyrs, which include Maximilian and Marcellus, opposed Christian involvement in war.

Origen (ca. 185–253 CE) of Alexandria, an important early Christian thinker, wrote at length about Christian attitudes toward war. Origen's primary work concerning war, *Contra Celsum* (*Against Celsus*, 248 CE), addressed the attacks of Celsus, a pagan author, who had questioned the allegiance of Christians to the emperor because of their refusal to participate in the army and defend the Roman empire.

Origen claimed that the doctrines of Christianity did not allow Christians to join the mili-

Origen, a father of early Christianity, was both a biblical scholar and a theologian. (Art Resource, NY)

tary, learn the art of war, or even defend themselves against their enemies. Furthermore, Origen argued that Christians should be given the same treatment as pagan priests who were exempted from military service because both pagan priests and Christians demonstrated their allegiance and provided assistance to the emperor through their prayers.

Although Origen did not allow for direct Christian involvement in war, he did not condemn war entirely. In fact, he claimed that Christians helped righteous emperors win wars through their prayers. While Origen did not condemn the wars of the Roman empire, he did hope that eventually war would cease when the entire empire was converted to Christianity. According to Origen's vision, if the entire Roman empire were Christian, Romans would no longer need to fight because God would protect the empire.

Jains and Ahimsa

Ahimsa is a Sanskrit word often translated as “nonviolence.” But a far more adequate translation of this word would be “the absence of the desire to do harm.” Contemporary Jain monks and nuns frequently describe ahimsa as “nonviolence in thought, word, and deed.” Ahimsa, in other words, is a state of existence characterized by the absence of any harmful thought, feeling, or action toward any living being. Contemporary Jains will also explain that far from being a state of indifference, ahimsa is not only the absence of the desire to do harm but is also a positive state of benevolence toward all beings.

All of the major Indic traditions—Hindu, Buddhist, and Jain—affirm the centrality of ahimsa as a virtue. The importance of ahimsa is proclaimed in Hindu texts such as the *Mahabharata*, and the first of the Buddhist Five Precepts is a vow to avoid deliberately harming any living thing.

But ahimsa is arguably even more central to Jainism than to either the Hindu or the Buddhist traditions. Jainism has exerted a strong influence on both of these traditions such that Jain practices, such as vegetarianism, have found wide acceptance among both Hindus and Buddhists to the present day. Even if these claims are somewhat debatable, it is definitely the case that Jains take the practice of ahimsa to lengths unparalleled in at least the mainstream practices of Hinduism and Buddhism.

Ahimsa is the central ethical principle of Jainism. It is foundational to the Jain way of life and is the operating principle behind a wide array of Jain practices, both lay and ascetic. For the layperson, ahimsa is a relatively straightforward matter of avoiding, as in Buddhism and Hinduism, deliberate harm to any living being. Jain laypeople are expected to follow a strict vegetarian diet and to avoid trades that would necessitate acts of violence or close involvement with violence. For this reason, Jains have tended

to gravitate toward business professions, generally avoiding careers that involve the actual manufacture of goods due to the harm to living beings that such manufacture entails.

For Jain monks and nuns, the expectations are even greater. A Jain monk or nun is expected to not only avoid deliberate harm to any living being but also to take great care to avoid even the accidental destruction of life involved in, for example, treading upon an insect in the dark. The strictures of ahimsa give rise to a host of rules that regulate the movements of Jain monks and nuns. Jain ascetics cannot, for example, travel at night. They must walk barefoot. Many wear a *muhpatti*, or mouth covering, that prevents the accidental ingestion of insects and microorganisms in the course of talking and breathing. Travel in modern conveyances, such as planes, trains, and automobiles, is forbidden due to the harm to small life forms inevitably involved in the process of internal combustion.

The difficulty of observing the Jain monastic rules has made Jain ascetics greatly respected across sectarian boundaries in India and is one reason that the Jain value of ahimsa has proven influential upon other traditions, such as Hinduism. Though practiced by few, the total ahimsa espoused by the Jains is seen as a noble, if difficult, ethical ideal in all of the Indic traditions.

Buddhist Rejection of Violence

Early Buddhists shared with Jainism and many orthodox Brahmanical sects the belief in the doctrine of *ahimsa* (“nonviolence”). Like other ancient Indian ascetics and voluntary renunciators (*śramanas*), Buddhist monks denounced the violence required to perform the traditional sacrificial rituals of the home and the state, and they rejected the violence inherent within the

law enforcement responsibilities of the ruling class. Nonviolence was cultivated primarily for the spiritual benefits accruing to a mind suffused with compassion as opposed to the dangers brought on by a mind disrupted by violent or hateful thoughts. One of Buddhism’s basic doctrinal goals is to articulate the causes of suffering for living beings so that suffering might be eliminated, and violence is of course counted among the major causes of suffering. In addition, Buddhist scriptures describe how violence and conflict arise as a causal result of negative states of mind (selfishness leads to stinginess, which leads to guarding possessions, which in turn leads to taking up weapons).

The Buddha’s rejection of violence did not prevent him from dispensing advice even to the most dangerous and intractable of kings. It is instructive to consider his polite exchanges with Ajatasattu, a king who was a convert to Buddhism, but can hardly be said to have genuinely restrained his violent impulses.

Buddhist scriptures record Ajatasattu as having been incited by the Buddha’s nemesis, Devadatta, to kill his father and usurp the throne. Furthermore, after assisting Devadatta’s many failed attempts on the Buddha’s life, Ajatasattu eventually meets with the Buddha in person, hears a sermon, confesses his wrongdoings, and accepts the Buddha as his teacher. Later, shortly before the Buddha’s passing, Ajatasattu is planning an attack on the Vajjian tribal confederacy, and believing the Buddha to be omniscient, he sends a representative to ask the Buddha’s advice. The Buddha’s reply is not, as one might have expected, a discourse on the immorality of offensive war but rather a declaration that the Vajjian tribes cannot be conquered as long as they are secure in their mutual support and moral behavior, behavior taught to them by the Buddha himself. The explicit message is that there is strength in righteousness, but the implication is that the tribes can be conquered if they can be divided. Ajatasattu’s representative sows dissension among the Vajjians, which eventually allows Ajatasattu to prevail.

Two other famous early kings are legendary for having converted to Buddhism in the name of nonviolence. A popular Pali text, *The Questions of King Milinda*, describes a series of de-

➤ EXCERPT FROM “THE FRUITS OF THE HOMELESS LIFE”

The Buddha’s teaching “The Fruits of the Homeless Life” tells of king Ajatasattu’s rather cynical and skeptical request that the Buddha describe some genuine benefits of renunciation that can be seen in the here and now if there are any. The Buddha replies with a variety of clear and positive answers, and the king is converted.

“At this King Ajatasattu exclaimed: ‘Excellent, Lord, excellent! it is as if someone were to set up what had been knocked down, or to point out the way to one who had got lost, or to bring an oil-lamp into a dark place, so that those with eyes could see what was there. Just so the Blessed Lord has expounded the Dhamma in various ways. And I, Lord, go for refuge to the Blessed Lord, to the Dhamma, and to the Sangha. May the

Blessed Lord accept me from this day forth as a lay-follower as long as life shall last! Transgression overcame me, Lord, foolish, erring and wicked as I was, in that I for the sake of the throne deprived my father, that good man and just king, of his life. May the Blessed Lord accept my confession of my evil deed that I may restrain myself in the future!”

bates between the Indo-Greek Bactrian king Menander and the brilliant Buddhist monk Nagasena. At the end of the story, Milinda is said to have accepted conversion to Buddhism and even to have renounced the throne and become a monk. Also legendary is the great Mauryan king Aśoka’s conversion to Buddhism after experiencing great regret at the slaughter he caused during his Kalinga military campaign.

Confucian Contempt for War

In Early China the search for harmony was the natural answer to the political crisis that culminated in the so-called Warring States period

(481–221 BCE). The decline of the house of Zhou and the fragmentation of the political power brought great changes to Chinese society. Although war and disorder created economic and social dimensions tension, these problems stimulated great intellectual discussions. It is in this specific context that early Confucians proposed concrete solutions in order to both end wars between states and guarantee sustainable peace. For this reason the quest for equilibrium and harmony (*zhong he*) is one of the pivots of the Confucian tradition.

The Confucian contempt for war has to be considered as one of the central themes in the development of political ideas. Basically, in ancient China Confucians articulated their debates on the assumption that conflicts arise because the way (*dao*) was lost. Education had to be fundamental for those who held power and authority. From a Confucian point of view, war was the evidence of the improper methods of the ruler. The combination of learning and practice and the closeness of a good teacher were necessary in order to ensure the self-cultivation of the ruler and, by consequence, both the preservation of social harmony and the prevention of conflicts. Pacifying the world was the goal toward which the self-cultivation of the sage ruler was directed.

► CONFUCIUS ON WAR

Confucius said: “To lead an uninstructed people to war is to throw them away” (*Analects*, XIII.30).

“The things in reference to which the Master exercised the greatest caution were: fasting, war and sickness” (*Analects*, VII, 12).

James Legge, *The Chinese Classics*, Vol. 1 (Oxford, UK: Clarendon, 1893), 198 and 275.

The ideal order that existed in remote antiquity was the utopia that Confucians referred to, and harmony was the highest good. To prevent war and to guarantee a stable government, Confucians proposed an ideal orderly society whose foundations were based on the importance of ritual (*li*), music (*yue*), filial piety (*xiao*), benevolence (*ren*), and the sense of justice (*yi*), that is, related to another *yi* fitting. If the ruler's conduct had followed all these practices, people's attitudes would have become naturally harmonious, and the state would have been at peace. In this way, everybody could fulfill their role in the society and family (considered as a microcosm of the so-

ciopolitical order) without being unhappy; on the contrary, people could fully realize themselves. The hierarchy of roles was based on five relations that had to be respected: ruler-minister, father-son, elder brother-younger brother, husband-wife, and friend-friend. The sense of ritual would foster social virtues such as filial devotion, brotherliness, righteousness, and loyalty. All public life as well as private life could then be stable.

Together with the sage ruler, the vital role of scholars—as perpetuators of the cultural heritage—was fundamental. They were supposed to transmit ethical principles and the proper moral values to the ruler in order to show him the right techniques by which to govern the state and to avoid political and social conflicts. In preimperial China, if a scholar was not satisfied with the work and behavior of the ruler, he could leave him and look for another ruler interested in his teaching. In this way, the Confucian contempt for war was part of the fundamental education for the ruler searching for a good government.

■ Introduction: Changes in Warfare

The designation of Iron Age for the period that begins in the Near East around 1200 BCE and in Europe around 800 BCE is a relatively arbitrary marker of cultural change, coinciding with the widespread appearance of iron technology in these regions. Scholars have made much out of the appearance of iron, suggesting that this provided a distinct military advantage to those who had it over those who only had access to bronze, since iron weapons can be much stronger than bronze ones. In fact, the sit-

uation is more complex than this, as the strength of iron can vary dramatically.

The technological advance of iron is just one example of the many technological and tactical advances that occurred in warfare between 1000 BCE and 300 CE throughout the world. Improved fortifications, warships, crossbows, and composite bows gave distinct advantages in combat. New tactical strategies changed the ways in which battles were fought as the weaknesses were in one type of tactic exploited and a

new type of tactic came to be used (until its weaknesses were exposed). The following entries explore the major changes in warfare that occurred from 1000 BCE to 300 CE.

—Kevin M. McGeough

New Types of Defensive Architecture in Asia

In Asia proper new types of defensive architecture emerged in the classical world in response to changing military technology and methods of warfare. The large walls and fortified cities of the classical world were the end result. Warfare in the last millennium BCE was altered by the change from bronze to iron, the change from chariot to horse and elephant, and by new siege technologies that exposed Bronze Age architecture. The Assyrians of the Near East, the Warring States in China, the Macedonians of Europe, and the Mauryan empire of India were the first to integrate all of these changes into new military systems and methods of warfare. Bronze Age kingdoms with single-site defensive architecture and chariot-based armies became obsolete. Integrated systems of defensive walls and cities were developed as part of new grand strategies aimed at building empires and unifying regions. Siege engines, rams, sappers, elephants, and infantry all became specialists in constructing and destructing defensive architecture of the period.

Populations in the classical world grew until most classical empires had around 50 million people by 2,000 years ago. This coupled with the emergence of iron and the horse transformed defensive architecture. To survive and thrive, old kingdoms grew into competing states and empires in India and China. Even nomadic peripheries were impacted by these growing populations, and in turn they raided the great civilizations, prompting massive defensive walls or co-option as hired mercenaries. Kingdoms like Maghada in India and Qin in China needed complex military systems and methods of warfare to survive. Grand strategy was developed, as seen in *The Art of War* by Sun Tzu in China and the *Arthashastra* by Kautilya in India. Defensive architecture was only one part of this approach.

> ONE GREAT WALL OR MANY?

When the first Chinese emperor unified the warring states he did so with a grand strategy that included outlasting other states economically. He then turned the energies of China to rebuilding the infrastructure, including the wall systems. Long walls had been built for defense throughout the first millennium BCE and became prolific in the Warring States period. The emperor had them repaired, connected, and lengthened into the interior along the emerging Silk Road trade routes. Thus, the 10,000-li (3,100 mile or 5,000 kilometer) long wall was born. Much later it was refurbished in stone by the Ming dynasty, the wall we see today on postcards.

—Christopher Howell

Defensive architecture in China was transformed in the Warring States period (480–221 BCE). The competition to unify northern China and pacify the horse nomads resulted in massive defensive architecture programs by the warring states. Cities were turned into stone and rammed-earth forts, and entire travel routes were blocked by long walls. Ultimately the Qin state alone was left standing by 221 BCE and was unified under the first Chinese emperor, Qin Shi Huangdi. He completed road systems and unified long walls into the ten “li” great or long walls that stretched for over 12,800 li (4,000 miles or 6,400 kilometers) into the interior. The walls were modified many times and protected both the Silk Roads trade routes and a new unified China.

In India, enormous fortifications surrounded the capital city of Pataliputra, which was the center of the Mauryan empire (323–185 BCE), developed under Chandragupta Maurya. It was protected by a huge earth and timber wall with 64 towers that stretched for almost ten miles (16 kilometers) and was surrounded by a 300-foot-wide (90-meter-wide) moat. The wall was later strengthened with stone.

Both India and China had enormous walled cities and long walls that were used as part of a larger grand strategy to unify each region. However, the enormous cost in civilization resources kept the life span of each empire short.

Mediterranean Warships

The standard warship of the ancient Mediterranean was the galley, a relatively long and narrow ship powered by oars, although they carried sails when not in battle. Until the first millennium BCE, the object of a sea fight was to capture a ship in hand-to-hand battle between the crews. Ninth-century BCE pictorial evidence reveals a shift toward using ships themselves as weapons by fitting waterline rams at the bow.

By the fifth century BCE, Greek warships were generally described by the number of rowers they carried, the most common being tria-

Roman warship with catapult mounted on the front, eighteenth-century engraving. (Jupiterimages)

conters (thirties) and penteconters (fifties). With all the rowers on the same level, a penteconter would measure about 98 feet (30 meters) long, making for a large, slow vessel. To overcome this, two-banked ships (biremes) were developed; these carried the same number of oarsmen on two levels in a hull roughly half as long. With stronger, more compact hulls, ships could better support rams as well as a raised deck for fighters. The first true biremes are depicted on eighth-century BCE reliefs at Nineveh, in Iraq, showing the king of Tyre fleeing an Assyrian fleet.

Developed in the seventh century BCE, the trireme carried a third bank of oarsmen. Unlike triaconters and penteconters, which could be single- or double-banked, triremes had a more or less fixed number of oarsmen arrayed in a standard configuration: 54 oarsmen on the lowest and middle banks (called thalamians and zygiants, respectively) and 62 thranites on the upper bank, for a total of 170. Triremes also carried a helmsman, people to keep rhythm with flutes and drums, lookouts and boatswains, and a contingent of warriors. The number of the latter varied depending on available manpower and the fleet's preferred tactics. At the Battle of Salamis in 480 BCE, Athenian ships carried about 10 marines, while the Persians carried 30.

The trireme remained the warship par excellence for seven centuries, but in the fourth century BCE central Mediterranean navies began to put more than one rower to an oar. Such ships were designated by the numbers of oarsmen in a single vertical file of rowers—fours (quadriremes), fives (quinqueremes), eights, twelves, and so on—regardless of whether there were one, two, or three banks of oars. A five might have three banks of oars with one man at the thalamian oar, two zeugites, and two thranites, or it might be a single-banked vessel with seven men per oar. (Early modern European galleys had a maximum of eight rowers per oar, so an ancient 24 was probably a vessel with three banks of oars with eight men to an oar.)

In addition to soldiers—Roman quinqueremes carried 300 rowers and 120 marines—larger ships could mount catapults. The oldest form of long-range shipboard artillery, catapults could shoot arrows or grapnels, pots of vipers and scorpions, or fire pots. Ramming remained an important as-

► THE HELLENISTIC NAVAL ARMS RACE

A major factor in the strategic calculus of Alexander the Great's Hellenistic successors was control of the timber trade in Macedonia, Asia Minor, Cyprus, and Lebanon. Because access to forests was essential for shipbuilding and maritime trade and for the naval forces required to protect the trade and access to the wood, the naval contest of the third century BCE fed on itself. The appetite for wood was further whetted by the development of ever-larger ships, including twin-hulled vessels of the Ptolemys' Egyptian navy described as "thirties" and a "forty." The historian Athenaeus's description of the latter is fantastic but credible: 50 feet (15 meters) wide and 400 feet (122 meters) long with room for 4,000 oarsmen, 2,850 marines, and 400 officers and crew of various sorts. It is

thought that this vessel actually comprised two "twenties"—that is, with 20 oarsmen in a single file working oars in the thranite, zeugite, and thalamian positions—joined by a raised platform that spanned the hulls and supported the marines. Twin-hulled ships were not complete rarities, and some were credited with speed and effectiveness. But the most extreme of these creations were intended to magnify the power of the rulers who built them rather than for any practical purpose. "Hardly differing from buildings that are fixed in the ground," wrote Plutarch of Ptolemy IV's forty, "it moved unsteadily and with difficulty, to make appearance for display, not use," a showboat in the truest sense of the word.

—Lincoln P. Paine

pect of naval warfare, but taking enemy ships by boarding was also a standard tactic, as it would be until the coming of steam-powered warships in the nineteenth century.

By the 260s BCE, the strongest Mediterranean naval power was Carthage, which ruled vast tracts of North Africa, southern Spain, the Balearics, Sardinia and Corsica, and western Sicily. Carthage and Rome first came to blows over control of Sicily. After a three-year stalemate on land (during which time they relied on allies to ferry supplies to Sicily), the Romans decided to build their own fleet. Acknowledging the Carthaginians' superior ship-handling ability, the Romans focused on winning by capturing ships and developed a combination of grapnel and boarding ramp called a *corvus* (crow) to fasten their ships to the enemy's and facilitate boarding. The *corvus* proved effective in battle, but when not in use it would have made ships top-heavy. *Corvi* may have been partially responsible for the loss of 280 ships and 35,000 men in a storm in 255 BCE, and this in turn may explain why they are not mentioned after that.

Smaller vessels were used for scouting and patrolling. In the fourth and third centuries BCE, the Rhodians patrolled the Aegean with the *trierarchy*, which is thought to have resembled a trireme but with only two and a half banks of oarsmen: 120 rowers rather than 170. The Ro-

mans also used *liburnians* and *lembi*, which originated as Adriatic pirate vessels and were well suited for scouting and raiding expeditions. The river fleets posted on the Rhine and Danube rivers, which more or less defined imperial Rome's northern border between the North Sea and the Black Sea, featured slender open vessels called *lusoriae*.

Greek Warfare—Hoplite Fighting Forms

Hoplites were Greek heavy infantrymen during the period of the city-states (roughly 700–300 BCE). The name "hoplite" derives from the word *hopla* (sing., *hoplon*), meaning items of armor

➤ HOPLITE ARMS AND EQUIPMENT

Hoplites wore a corselet (covering the chest and back), greaves (covering the lower legs), and a helmet with cheekplates into battle. These pieces of armor plating were made entirely of bronze and were approximately half an inch (1.3 cm) thick, which provided substantial protection against enemy swords, spears, and missiles. Each hoplite also carried thick concave shields (called an *aspis*), wooden with a bronze veneer, that were 3 feet (1 meter) in diameter and weighed 15–20 pounds (6–9 kilograms). These shields were held on the left arm, which meant that each hoplite relied on the soldier to his right to protect his unshielded right side. They carried a wooden spear (*doru*), 7–10 feet (2–3 meters) in length, as well as an iron short sword made for thrusting (called a *xiphos*) because their spears frequently broke in battle.

—Andrew Byers

or military equipment, because hoplites wore heavy armor and helmets and carried large wooden shields, spears, and iron short swords. The total weight of hoplites' arms and equipment was between 50 and 70 pounds (20–30 kilograms). Hoplites were citizen-militia rather than permanent professional soldiers and were primarily drawn from the middle class, who could afford to purchase and maintain the required equipment.

Because hoplites were militia and were unpaid, military campaigns were generally short and were conducted in the summer months. The enormous weight of the hoplites' equipment meant that hoplite battles were often quick and were intended to be decisive. Hoplites would usually meet their enemies on a level field. Both forces would then mass into phalanxes, lock shields together, and charge straight at enemy formations. These direct charges were usually brutal matches, with the first few ranks of hoplites extending their spears through the interlocked shields, with each row of hoplites using their shields to push against the backs of the men in front of them. If cavalry forces were present, they would generally guard the flanks of the hoplites. Lighter infantry forces and missile troops were often not present at all during hoplite battles.

The goal of hoplite warfare was to break or encircle the enemy's line. If that failed to happen, the battle often degenerated into a shoving match, with men in the rear trying to push the front lines through those of the enemy (this tactic was called the *othismos*). Because of the intensity of hoplite shock combat and the weight of their equipment, battles rarely lasted longer than an hour. Battles were usually decided by one side breaking, with survivors generally being allowed to flee the field without being pursued. Casualties were typically light, but the dead and injured were often disproportionately the most influential citizens, who led their hoplite forces from the front. This also meant that wars could be decided by a single battle if key enemy leaders could be captured or killed. Captives were then ransomed back to the defeated side.

Hoplite warfare's rise and fall was connected with the rise and fall of the Greek city-state system (the polis structure). During the Greeks' wars with the Persians, hoplites were forced to adapt to changing conditions of warfare, carry less armor, and become more mobile. By the time of the Peloponnesian War (431–404 BCE), hoplite warfare was already in decline, with greater reliance on naval combat and siege warfare, all of which caused a greater emphasis on attrition warfare and increased casualties in battle. Philip II of Macedonia's forces defeated the last major hoplite force at the Battle of Chaeronea in 338 BCE, after which Athens and its allies were forced to join the Hellenistic empire. This led to the adoption of the more versatile combined arms tactics of the Macedonians. The Greek style of hoplite warfare did, however, leave a lasting legacy around the Mediterranean region. The Roman legions—dominant in Western military history for centuries—were derived from hoplites.

Greek Phalanx

The phalanx was an ancient Greek battle formation composed of heavily armored hoplites that fought in columns closely packed together in a mass, usually eight ranks deep. Typically armed with a large circular shield known as a *hoplon*, a large spear, an obtrusive helmet, and additional bronze body armor, hoplites would engage in tight formation, vulnerable to attacks by archers or spear attacks. The hoplites themselves were composed of citizen-farmers of the various city-states, which had gradually been included in the military after the hoplite reform at the end of the Greek Dark Ages (1200–1800 BCE). The phalanx became a prevalent battle tactic among the quarrels of the Greek city-states during the Classical period as a result of its comparative efficiency as a form of warfare in comparison with previous hand-to-hand engagements of aristocratic cavalry.

Phalanx tactics involved engaging the opposing phalanx with skirmishers, archers, and spear attacks to deplete their numbers in the vulnerable areas of their bodies not covered in armor. The roundness of the shields typically provided enough exposed areas for penetration: around the neck and the top of the shoulder in addition to parts of the legs not covered with bronze greaves. The back was typically not covered by armor, leaving anyone in retreat

➤ HOPLITE BATTLE EXPERIENCE IN VERSE

"With a sudden rush he turns to flight the rugged battalions of the enemy, and sustains the beating waves of assault.

And he who so falls among the champions and loses his sweet life, so blessing with honor his city, his father, and all his people,

With wounds in his chest, where the spear that he was facing has transfixed

That massive guard of his shield, and gone through his breastplate as well." (Tyrtaios 12.21–26)

—Andrew Byers

➤ THE DEFEAT OF THE SPARTAN PHALANX

Sparta, long known for its martial prowess, was defeated at the Battle of Leuctra in 371 BCE by the Theban general Epaminondas, who devised an innovative phalanx tactic. Epaminondas thinned out the center and right portions of his force in order to field a massive phalanx 50 ranks deep on his left, what was traditionally the weakest flank of a phalanx formation. This oblique phalanx, as it has come to be called, allowed the Thebans to turn the Spartan right flank, striking a decisive blow and routing the Spartan king and his elite bodyguard (the *agema*). Sparta's defeat in battle had far-reaching political effects, with the Greek balance of power permanently altered, Sparta becoming a second-rate power, and Thebes being freed from Spartan

domination and achieving a preeminent position in Greek politics. The battle was witnessed by a young Philip of Macedon, father of Alexander the Great.

THE PHALANX OUTSIDE GREECE

Classical Greek heavy infantry known as hoplites customarily fought in a rectangular column—known as a phalanx—designed for shock encounters against enemy forces similarly armed and organized. The earliest known evidence of a phalanxlike formation is a depiction on a Sumerian stele dated around 2450 BCE; similar formations are known to have been used by Egyptians as well. The relationship of the Greek phalanx to these Sumerian and Egyptian predecessors is unclear, but it is likely that the Greek phalanx was introduced around the seventh century BCE in the city of Argos, which adopted the *aspis* shield, thereby making the formation possible. The word “phalanx” (pl., phalanxes or phalanges) is derived from the Greek word for “finger” (*phalangeros*). The phalanx was a formation in which hoplites would line up and lock their shields together, and the first three ranks of hoplites would extend their spears over the first rank of shields, thereby creating a wall of tightly packed spears and shields. The Greeks did not invent the concept of the phalanx, since ancient Sumerians and Egyptians are also known to have fought in phalanxlike formations, but the Greeks refined the concept into neat ranks and lines.

The phalanx was nearly indestructible from the front, but it was slow moving—due to the hoplites’ heavy equipment—and had difficulty in protecting

its flanks and rear. Enemy archers or slingers could also stay at a safe distance from the phalanx, peppering it with missile fire. The phalanx was weakest when fighting enemies possessing significant numbers of lighter, more flexible forces. Eventually the Greeks embraced the use of skirmishers, sea battles, and siege warfare, which spelled an end to the almost choreographed set-piece battles of phalanx warfare. The phalanx and similar formations did not die out completely, however, for many centuries. The phalanx inspired the Roman legions as well as the Anglo-Saxon shieldwall, the Swiss pike square, and the Spanish *tercio* of the sixteenth and seventeenth centuries, which combined the sturdiness of the phalanx with the greater flexibility and firepower of muskets.

completely vulnerable to enemy fire (in the form of arrows and spears). After an initial opening strike, the phalanxes would engage in a full frontal attack. Before such an attack, much drinking and morale boosting would take place among the troops, led by their commanders. As representatives of their polis (city-states), they would typically let out battle cries praising their city or the god or goddess representative of their city and offering animal sacrifices to such deities. The allies of each respective city-state would usually be on either flank, with the center reserved for the city’s own hoplites.

In actual battle, the phalanxes would typically attempt to flank each other when they met in tight formations on the battlefield. However, the front ranks would typically be the ones to engage in combat directly, typically hand to hand,

after the run and push. Armed with a spear with a butt-spike on the backside, hoplites would attempt to smash through their enemies and render them completely vulnerable. Also armed with a short slashing sword, hoplites at close range could stab their opponents in the heat of battle. Any attempts to retreat or surrender on the part of an individual hoplite were discouraged due to the fact that they had no armor on their backs. In addition, due to a sense of honor and esprit de corps, hoplites typically would not surrender and would fight to the death.

Much of the historical evidence regarding the Greek phalanx comes in the form of archaeological remains and in ballads composed by various eyewitness poets or those recounting the events in common poems passed on through oral traditions. While many of these engage-

ments were among the feuding Greek city-states, typically in warm weather, which was the usual campaigning season, the Greek phalanx was also used as a battle formation against foreign troops. An example would be the Battle of Marathon in 490 BCE that pitted Athens against the invading Persians.

The Roman Legion

The Roman legion was a critical component for the success of the Roman empire and its growth from city to Mediterranean power. The legion was a well-trained and well-equipped fighting force that allowed the Romans to defeat many rival empires such as the Carthaginians and Greeks. During the Imperial period the legion was so feared that revolting cities would often surrender their leaders rather than have to fight such formidable opponents.

The legion's composition varied as Rome grew from a small republic to a vast Mediterranean empire. The legion of the early republic could hold as many as 6,000 soldiers but normally contained about 4,200. The soldiers provided their own equipment and were divided into four classes: *velites*, *bastati*, *principes*, and *triarii*. Each legion was divided into 30 maniples for greater maneuverability during battle. The maniples were further subdivided into centuries, which were each led by a centurion. The maniples were flexible, and each class of soldier carried different equipment and filled a different function. Under Marius, the 30 maniples were replaced by ten cohorts, and all soldiers carried the same equipment.

Originally the legion consisted of temporary fighting units composed of landowning Roman

> MARIUS AND HIS MULES

Marius and his mules is a phrase used by Plutarch to describe the troops of Marius because each soldier carried his own bulky equipment in order to limit the number of baggage trains necessary to support the legion. The Senate allowed Marius, newly elected consul in 107 BCE, to draft an army to campaign against Jugurtha, king of Numidia. Due to the increasing need for more soldiers, drafting an army was difficult and unpopular. Marius's popularity as a *novus homo* (new man) threatened the power of the Senate, which hoped that allowing Marius to raise an army would substantially diminish his popularity. However, Marius did not follow the standard procedures for drafting an army and allowed landless citizens, *capite censi*, to volunteer for legionary service. This maneuver actually increased his popularity with the poor. Marius then led his well-trained volunteer mules to North Africa and captured Jugurtha, which Metellus had previously failed to accomplish.

—Kevin Scull

citizens obligated to fight for one campaigning season, from March to October. However, by the middle of the republic, Rome had conquered distant lands that required permanent military garrisons and frontier legions in order to protect them. Roman citizens were now required to serve in the army for 6 continuous years (16 maximum), and landowning citizens were forced to leave their fields to be tended by family and friends. In addition to lengthier commitments, more soldiers were needed, and it was becoming difficult to enlist soldiers who met the minimum standards of property ownership.

This difficulty in recruiting soldiers prompted Marius to take drastic steps during his consulship in 107 BCE. Among the many reforms of the Roman Army credited to Marius, the most important was his decision to enlist and equip voluntary, landless Roman citizens (*capite censi*) in his legion. This important reform alleviated the problems of the farmer-soldier, made it easier to maintain a permanent army, and provided opportunities for Romans to pursue a career in the military. However, this innovation is often blamed for

the civil wars that followed, as powerful generals such as Sulla, Pompey, and Julius Caesar all recruited massive volunteer armies and used them to gain power.

Augustus's further reforms continued the army's transition to a permanent professional fighting unit. Under Augustus, the army was entirely composed of volunteers who committed to serve for 15 years (later expanded to 20) and were paid a yearly wage, and upon retirement those who survived were given a large monetary payment for their service. In the second and third centuries Italians became less eager to join the military and were replaced by men from Rome's many provinces seeking a military career. This change completed the transition of the Roman legion from a temporary army composed of Roman citizens to a permanent professional force of voluntary provincials seeking a military career.

Military Engineering in Greece and Rome

Military engineering has a long history in the ancient Mediterranean, with Greco-Roman practices stretching back to the Bronze Age and evolving through late antiquity. Citadels were often defended by cyclopean walls, so-called because of the mythical strength and size supposedly needed for their construction. In some cases such as at Mycenae and Tiryns, such defenses were repaired and reused by the later inhabitants following the fall (ca. 1200 BCE) of the Mycenaean palace culture.

Despite the centrality of the siege of Troy in the *Iliad*, the nature of Greek warfare and society precluded sophisticated offensive siegecraft until the early fourth century BCE. Fairly simple

curtain walls incorporating natural strong points such as a city's acropolis (e.g., Athens, Corinth, etc.) provided protection against most direct assaults and thus became regular urban fixtures. Such circuits could be fairly far flung, and Long Walls such as those running from Athens to its port, Piraeus, presented operational and strategic challenges to opponents.

In the fifth century the Greeks' internecine conflicts resulted in a general increase in the use of siege warfare driven by the funds of the Athenian empire and Persian gold as well as the desperate nature of the Peloponnesian War (431–404). However, the main Greek offensive siege technique did not progress beyond circumvallation by construction of blockade walls until the war's aftermath. Fortification in an offensive role also became more common with the construction of works (*epiteichismos*) within enemy territory to aid in devastation and subversion such as the Athenian fort at Pylos and the Spartan fortification of Decelea.

The Syracusan tyrant Dionysius I ushered in a new era by demonstrating a wide range of siege techniques in his wars with the other inhabitants of Sicily. In addition to incorporating much from his Carthaginian opponents, he is generally credited with the invention of the rudimentary arrow-firing catapult in 399 BCE. His techniques spread to the rest of the Greek world by midcentury. In addition to rams, towers, escalades, and tunneling, the sponsorship of Philip II and the developments of the wars of Alexander and his successors soon added more powerful torsion catapults (attested at the siege of Perinthus in 340 BCE) and stone-throwing artillery (attested at the siege of Halicarnassus in 334 BCE). The defensive response included accommodations for defensive artillery, the more scientific siting and design of fortifications to take better advantage of terrain and enfilade, outworks to hinder the advance of engines, and postern gates to allow sallies by defenders mounting an active defense.

Alexander's siege of Tyre in 332, though costly, demonstrated the effectiveness of these new techniques and included a massive mole, shipborne artillery, and rams. Hellenistic siegecraft would go on to reach its most grandiose apogee during the career of Demetrius Poliorcetes (the Besieger) who, despite his enormous

siege tower, the *belepolis* (city-taker), was unsuccessful in his spectacular attempt to take Rhodes in 305–304.

Republican Roman fortification and siege techniques should be seen in the context of developments occurring in the Greek Mediterranean. By the third century BCE and Rome's expansion out of Italy proper, the Romans seem to have at least begun assimilating the Hellenistic arsenal of artillery, assault techniques, and equipment, bringing their typical determination in war to the prosecution of sieges. Claudius Marcellus's 213–212 BCE siege of Syracuse in the Second Punic War brought the Romans face-to-face with some of the most sophisticated city defenses of the Greek world, ingeniously designed and deployed by Archimedes. Only sheer persistence and exploitation of internal divisions eventually allowed the Romans to overcome the superiority of the Syracusan fortification and engines.

While the Roman-fortified marching camp is most famously described by Polybius (6.27–34) in the second century BCE, Greek castramentation and fieldworks consisting of earthworks and palisades are attested as early as the *Iliad* and continued in use through the Hellenistic period. Roman practice, as discussed by Polybius and confirmed by physical remains, was more formal and called for a precisely surveyed and planned square camp surrounded by a rampart and internally organized on a grid plan.

The art of military road building was not unknown among the Greeks, as Herodotus mentions some responsibility on the part of the Spartan kings for the maintenance of roads. Moreover, there does seem to have been a road network that formed part of the defense system of Athens' land frontier. Additionally, there are traces of well-constructed routes leading across the frontiers into neighboring territory for a presumably offensive purpose. The Romans would pursue these practices on a much larger scale, constructing formidable routes into their theaters of conflict. The famous Via Appia, begun in 312 BCE and originally running from Rome to Capua, was undoubtedly instrumental in the final stages of the Samnite Wars and the conquest of southern Italy. Later additions through the Imperial period would eventually spread a network across the empire. On the march, bridges were

➤ COMPARISON OF THE GREEK AND ROMAN CAMPS

Greeks, in choosing a place for a camp, thought primarily of security from the natural strength of the position, first because they were averse to the toil of digging a foss and second, because they thought that no artificial defenses were comparable to those afforded by the nature of the ground. Accordingly, they not only had to vary the whole configuration of the camp to suit the nature of the ground but also had to change the arrangement of details in all kinds of irregular ways so that neither soldier nor company had a fixed place in it. The Romans, on the other hand, preferred to undergo the fatigue of digging and of the other labors of circumvallation for the sake of the facility in arrangement and to secure a plan of encampment that would be one and the same and familiar to all.

—Joseph Frechette

built on piles of masonry or timber or, alternatively, laid out across pontoon boats.

By the Imperial period the Romans had mastered all the now traditional elements of siegecraft, with each legion having its own surveyors, engineers, and workmen as well as artillery and siege trains that included, by the late first century CE, the small, powerful, all-metal framed *carroballista*. In the realm of fortifications, the Romans could and did make greater and more sophisticated use of concrete. The tumult of the third century CE would see a resurgence in the relevance of urban fortification. While western barbarians were not generally capable of assaulting sophisticated fortifications, the Sassanian Persians were, as testified by the number of cities captured by Shapur I in the 250s and 260s. Of these, Dura Europus is of particular note, as its excavations have uncovered dramatic evidence of its final siege.

Greek and Roman Arms and Armor

Following the collapse of the Mycenaean palace culture but sometime before 1000 BCE, the use of iron began to be adopted by the Greeks from the Near East for use in weapons and equipment. The designs of the Bronze Age cut-and-thrust swords were initially simply reproduced in the new material, although gradually they became shorter and stouter in the ninth and eighth centuries. Grave-finds of multiple spearheads become common from 900 BCE onward and sug-

► THE HOPLITE PANOPLY

During 650–350 BCE, hoplite military tactics allowed the Greek armies to outperform the armies of other regions. Whether or not the adoption of hoplite equipment occurred suddenly or as a result of a gradual process is a point of some debate, as is the exact nature of the tactics it must have dictated. However, the double-grip of the shield is noteworthy because it was wholly innovative and, unlike its single-grip predecessors, implies a particular suitability for the close-order fighting of developed phalanx warfare in which each soldier had shelter behind the shield of the man to his right. The chronology for the adoption of such tactics suggests that they might have played a significant element in the formative period of the Greek polis as a political institution. Since the hoplite phalanx structure is egalitarian and required a soldier to depend on his comrades-at-arms, it is thought that this egalitarianism may have been instrumental in the development of democracy.

—Joseph Frechette

gest that in the Greek Dark Ages multiple spears would be carried and thrown as javelins. There is no evidence for the use of metal body armor in the Dark Ages until the end of the eighth century, although perishable materials such as leather or linen may have been used.

The typical weapons of hoplites (heavily armed Greek soldiers) began appearing in the late eighth through the mid-seventh centuries, eventually spreading through the Greek world into Italy. This panoply of helmets, bronze breastplates, greaves, thrusting spears, short swords, and double-grip shields, although somewhat lightened over time, saw service down through the fourth century BCE. Light-armed troops demonstrated their value on several occasions during the Peloponnesian War and its aftermath, but it is difficult to trace the evolution of such items as the bow, sling, javelin, and wicker shield because they were mainly constructed of perishable materials.

The Macedonian phalanx that finally superseded that of the classical Greeks in the late fourth century differed markedly in armament. Notably, the metal cuirass (metal breastplate) seems to have been dispensed with as a standard piece of infantry equipment. Instead, Philip and Alexander's infantrymen wore greaves, helmets, and a smaller shield that seems to have been slung around the neck, leaving both hands free to wield their main offensive weapon, the *sarissa*, a pike of 18–21 feet (5.5–6.5 meters). The relative lightness of the infantry contrasts with the Macedonian cavalry, which was equipped heavily enough with various types of cuirasses, helmets, slashing swords, and stout spears that it could operate as the striking arm of Alexander's army. In the third century the Macedonian cavalry panoply would become even heavier with the addition of a large shield.

Although the soldiers of the early Roman republic were likely armed with the hoplite panoply, by the time of Rome's expansion beyond Italy their equipment had evolved considerably often, incorporating the weapons of their opponents. Among the heavy infantry, the thrusting spear gave way to the heavy javelin, or *pilum*, along with the Spanish sword, the *gladius hispaniensis*, while the large round shield was replaced by the oblong *scutum*. Armor consisted

Hoplites in combat. Red figure pelike-type vase attributed to the Greek vase painter Smikros, sixth century BCE. (Réunion des Musées Nationaux/Art Resource, NY)

of small breastplates or mail coats and hemispherical helmets.

In the Roman Imperial period, chain mail continued in use along with scale armor, while the famous *lorica segmentata* formed from iron bands held together by internal straps was used through the second century CE, and the legionary scutum evolved into the curved rectangular-shaped shield prominently displayed on various monuments. Various other types were used by auxiliaries.

More dramatic changes begin to become visible in the third century. Although the long sword, or *spatha*, was originally adapted from Celtic types for use by Roman cavalry, it eventually came into more general use. Perhaps more significantly, finds of scale armor horse trappings on the eastern frontier dating to 250 CE indicate the presence of heavy cavalry, which would play a more significant role on the battlefields of late antiquity and the Middle Ages.

Development of Iron Arms and Armor

Iron arms and armor led to a revolution in warfare during the early first millennium before the Common Era. Although iron had been known and used by men for centuries, it was not used in great quantities before this period because of the difficulties in working and refining most deposits. Gradually, iron replaced bronze in weapons and armor after 1000 BCE. When it did, it helped “democratize” warfare by making warfare more affordable and enabling states to field larger armies.

Iron was known to men by 2500 BCE. At first, it was considered a rare and valuable material because of its scarcity and the difficulty in working it. The first examples of iron objects were made from meteoric iron, which includes large amounts of nickel. Later, smiths found that beads of iron, which were a residue from smelting copper, could be hammered into a larger mass. This wrought iron was shaped into ornaments and objects that were reserved for royal or religious uses. Unlike copper or bronze objects, iron ornaments lacked pleasing colors and easily rusted. Their dark colors were somber and associated with death and war. Copper, especially when mixed with tin to form bronze, was much easier to work. The melting temperature was lower than iron, allowing smiths to develop techniques to cast copper and bronze products.

For warfare, bronze weapons and armor were harder and lighter than early iron ones. They offered many advantages, which calls into question why iron arms and armor replaced them. Early craftsmen were not able to control the amount of carbon in their iron, often resulting in iron that was brittle and unsuited for warfare. One reason may be the relative scarcity of

➤ SARGON II

Sargon II was one of the most militaristic rulers of a militaristic society. During his 16-year reign, the Assyrian Army carried out at least ten major wars or suppression campaigns. Sargon's victims included the kingdom of Israel and its capital of Samaria as well as Egypt, Elam, and Babylonia. Cyprus accepted Assyrian rule during this time, as did other states throughout the Middle East. Sargon's best-known campaign was against Urartu, beginning in 714 BCE. The terrain over which the Assyrians marched was difficult, but the highly organized and disciplined army was able to cope with it. Sargon defeated Rusa, king of Urartu, and his allies in a winter battle in late 714. As he marched on the Urartu capital of Tuspar, Sargon destroyed the cities and villages along the way. The Assyrians slaughtered the inhabitants in a calculated attempt to destroy the enemy's morale. Rusa fled without a fight, and the Assyrians destroyed Tuspar. Sargon later recorded in his description of the campaign that the despairing Rusa took his own life with his iron sword like a pig.

—Tim J. Watts

copper and tin deposits and their relative expense. As sources were depleted in some areas or when peoples were cut off from their supplies, such as those found in Syria, they tended to explore other options. The Hittites, for example, are widely regarded as the first group to use iron arms and armor on a large scale. Located in modern Asia Minor, their supplies of tin and copper came from as far away as Bohemia and Syria. When hostile powers controlled these trade routes, the Hittites were motivated to use other materials.

By around 1500 BCE, the Hittites had discovered techniques of heating and reheating iron in a charcoal fire to produce an iron that was harder than bronze and kept its sharpness longer. The process of mining iron and smelting it was expensive and time consuming. Only a limited number of weapons were made. The secret to forging iron weapons was closely guarded by the Hittites, and their use of iron weapons is often credited as the reason for Hittite successes.

After the Hittite empire broke up around 1200 BCE, however, the process became more widely known throughout the Middle East. As the ability to make iron weapons from widespread deposits of iron ore became more common around 800 BCE, iron arms and armor became cheaper.

The first people to use iron weapons on a large scale were the Assyrians. Iron daggers were issued to elite troops by 880 BCE, and by the eighth century BCE the term “iron dagger” became synonymous with warfare and bloodshed. At first, iron weapons remained exceptional. In the lists of tribute and spoils from different Assyrian conquests at this time, iron joins gold, silver, and bronze as a rare and valuable prize. As late as the sixth century BCE, contemporary Babylonian documents reveal that many spearheads were made from metals other than iron.

The Assyrians were surrounded by hostile states, and they responded aggressively. To carry out their policy of expansion and repression, the Assyrians required a large well-trained army. Most of their army consisted of heavy infantrymen. Under Sargon II, who ruled from 721 to 705 BCE, the infantry was completely equipped with iron arms and armor. The creation, storage, and distribution of these iron weapons to soldiers who needed them were major logistical accomplishments.

Assyrian infantrymen were armed with long spears with iron heads and a straight iron sword. They wore knee-length iron mail armor and carried small iron shields. A conical iron helmet, lined with wool, protected their heads. High leather boots, reinforced with iron plates, protected their legs. Archers and cavalrymen were also equipped with iron weapons and armor. Between 890 and 650 BCE, the iron-equipped Assyrians were the most important army in the region.

The Invention of Crossbows

Crossbows are a further variation on the basic concept of the bow and arrow. Although there have been a variety of designs of this type of device, in general a bow is attached to a stick (called a stock), and the string is cocked and released by some sort of mechanism. The projectiles fired from them are usually referred to as bolts in ancient contexts. Crossbows provide a number of improvements to simple bow and arrow technology depending on the particular design, but usually they lower the amount of force required to draw the string (and thus fire the projectile) and can increase the speed at which projectiles can be fired.

The writer Heron of Alexandria describes a fourth-century BCE innovation called a *gastrophetes*, which means “belly-bow.” This type of crossbow was called this because the user would rest one end of the device against his belly. By pushing down with much force, the user could fire with much more power than by simply drawing a bow. The *gastrophetes* was large and consisted of a stock made of two cases, an upper and a lower (the lower was the part of the stock attached to the bow). The Greeks also utilized a larger-sized version of this device called an *oxybeles*, which was essentially a bow attached to a stand and used primarily as a siege weapon. The development of torsion spring technology (springs that are twisted) allowed for the development of a better form of the *oxybeles* called the *ballista* that fired lighter projectiles faster and farther. The Romans adopted this technology and advanced it; their *ballistae* were more accurate and could fire farther.

Another ancient Greek device that represented experimentation in ballistic technology was the *helepolis*, a moving siege tower that fired *ballistae* from different levels. Its name means “taker of cities,” and that well reflects its function. The wheeled *helepolis* was pushed during combat, while two sets of stairs in the interior allowed people to travel between the different stories within the tower. The bottom of the tower fired large *ballistae* with catapults, intended to destroy fortifications. The upper level

THE COMPOSITE BOW

The composite bow is a bow made of more than one material; usually the differing materials are joined together with some tension, and this allows for a smaller bow that fires faster and farther than a simple bow. The earliest composite bows so far recovered were found in Egypt in King Tutankhamen’s tomb, and likely they have been in use since chariots were first used in combat (as arrows would have been shot from moving chariots). From 1000 BCE to 300 CE, the use of the composite bow became much more common, and various styles developed, being used specially by the Chinese and Parthians. Many of the innovations in these types of bow may have come from the dwellers of the Eurasian steppes, who certainly introduced some of these technologies to Europe. Various changes in composite bow form and style seem to be first attested on the steppe regions, and Roman writers credit these nomadic groups with various advances.

—Kevin M. McGeough

fired *ballistae* that were much smaller, intended to kill human opponents.

Crossbows may have been invented earlier in East Asia, although the first documentation of them in China is roughly contemporaneous with that of the Greeks. Mohist writers (the followers of Mozi writing as early as the fourth century BCE) write about giant crossbows used as catapults in the sixth century BCE. There is little supporting evidence for the crossbow’s use as early as that time, but certainly by the time the Mohists were writing, this type of weapon was common. *The Art of War* by Sun Tzu also mentions crossbows, attesting to their use. Bronze and iron artifacts that may be ancient crossbow bolts have been found dating to the Warring States period (403–221 BCE), and certainly by 200 BCE the crossbow was a staple weapon in Chinese warfare.

The repeating crossbow was a particularly effective weapon developed in ancient China. Ancient Chinese historians credited its invention to Zhuge Liang (181–234 CE), but it was likely invented much earlier. This particular type of

crossbow allowed all of the main actions of firing a crossbow to be performed one-handed and more quickly than with a regular crossbow.

Roman Forts

The building of forts was an important part of Roman military discipline: legions on campaign in hostile territory were expected to build fortified camps at the end of a day's march to ensure their safety. The ancient historian Polybius has provided us with perhaps the best description of these marching camps. According to his account, such forts were rectangular in shape and were protected by both a ditch and a wall of wooden stakes. The tents within the camp were set up according to a regular pattern, which re-

flected the subdivisions of the Roman Army. This preset arrangement in turn helped ensure that Roman troops could erect their camps in as little time as possible. It has been suggested that the regularized layout of Roman forts may ultimately hearken back to the colonies, similarly built to a regular plan, that the Romans established as early as the fourth century BCE during the course of their expansion in Italy. A number of marching camps from the republican period have been excavated, although contrary to Polybius's account some of them are polygonal rather than strictly rectangular in shape, showing that the Romans could alter the standard fort plan when they saw fit.

In general, however, Roman forts of the late republic and early empire continued to be rectangular in shape and standardized in the layout of interior buildings. The two most important buildings, located at the center of a typical fort, were the *praetorium* and *principia*. The praetorium was the residence of the fort's commander, while the principia housed the standards and military shrine of the troops occupying the fort as well as administrative offices.

Roman forts of this period did not always take advantage of local topography like later medieval castles. The former were not meant to withstand long sieges by an enemy army but instead were intended to act as staging posts for Roman troops before they marched out and drove off the en-

➤ HADRIAN'S WALL

Unlike his expansionist predecessor Trajan, the emperor Hadrian consolidated the territory that Rome already held. In line with this policy, construction on Hadrian's Wall, much of which is still extant, was begun in the early 120s CE. In its final form, Hadrian's Wall consisted of a line of fortifications extending some 80 Roman miles (about 75 miles or 120 kilometers) between the Tyne and Solway rivers in northern England. The fortifications were made up of a stone wall some 13 feet (4 meters) in height, with watchtowers and fortlets incorporated into the wall at regular intervals. A ditch with earthworks, some 118 feet (36 meters) wide in total, was situated north of the wall.

—Christopher Epplett

Hadrian's Wall, England. (Corel)

emy. Over time, however, the Romans did make their forts defensible by, among other things, building them in stone instead of wood and by building larger projecting towers, with a wider field of vision, into the fort walls. Both of these developments began in the second century CE as the Romans sought to consolidate the territory they had conquered up to that point. Other examples of this consolidation include the elaborate fortified zones that the Romans built on the frontiers, most notably the Limes in Germany and Hadrian's Wall in England.

In the later empire as the frontiers increasingly came under military threat, the design of Roman forts changed significantly. Forts of this period were built to be much more defensible and were designed to be able to withstand sieges until reinforcements could arrive. Late imperial Roman forts, unlike their predecessors, often were built on high points of land or other defensible topographical features and were often irregular in shape so as to take advantage of such features as much as possible.

Trophy Head Cult

Trophy head cults are associated with Stone Age societies across the world. However, the practice was not limited to a few individual shrunken heads that captured the spirit and power of an enemy or ancestor. Crossover evidence of human sacrifices, war captives, ancestor veneration, and modified craniums indicates that trophy head cults were not uncommon before the modern era. The practice was most widespread along the Pacific Rim and reached its height in the pre-Columbian Americas.

SKULL RACKS IN MESOAMERICA

Skull racks represent the largest scale evidence of trophy-head taking. The practice was common throughout Mesoamerica, based on archaeological finds. Even the Mixtec codices or bark books feature skull racks in their portrayals of cities and civic centers. Most racks were associated with war captives and the sacking of cities. The practice has some similarities with Bronze Age warfare displays of the dead in other parts of the world. Mediterranean and Asian practices of displaying dead bodies on poles was often done one at a time, thus indicating the efficiency and development of the practice in Mesoamerica.

—Christopher Howell

Indonesian and Australasian indigenous societies practiced the cult into the twentieth century, and Stone Age Papua New Guinea groups may still do so. Africa and central Asia had some war trophy cults too. In southwestern North America rock art depicts trophy heads, while moundbuilding societies of eastern North America also employed the practice, probably in warfare. Amazonian and circum-Caribbean peoples have evidence of trophy cults as well.

However, in the Andes and Mesoamerica trophy head cults reached their greatest extent. In the Andes by the last millennium BCE evidence of the cults is found in iconography at Cerro Sechin, with sacrificed captives having heads and other body parts removed. The sacred site of Chavín displayed trophy heads in its temple area, the first known instance of trophy heads in association with a civilization's most sacred architecture. By the first millennium CE the Nazca culture regularly portrayed trophy heads on ceramics and textiles while also mummifying them. One study of 150 Nazca trophy heads found that 93 percent were adult and 7 percent were children. Men became much more common than women as time went on. Cerro Carapo alone yielded 48 male trophy heads. The Moche on the northern coast of Peru ritualized human sacrifice and head taking on their pottery and in their temple pyramids. They developed a special crescent-shaped copper knife, or *tumi*, for the rituals, although obsidian knives were the common choice for most North

American indigenous trophy head cults. The Wari, Tiwanaku, and Inca civilizations continued this tradition of taking trophy heads. Trophy heads in the Andes were often displayed in roped groups and were hung by holes drilled in the cranium, based on iconography and skeletal evidence.

In Mesoamerica the practice reached its greatest scale. Although early Olmec, Maya, and Teotihuacan cultures have evidence of the cult, it was warlike nomads from the north who institutionalized it into their warfare systems. These Chichimec peoples developed the skull rack, or *Tzompantli*, to display sacrificed war-captive trophies. A pole was run through a series of heads, and the poles were stacked up in skull racks that could number in the hundreds or even thousands of trophy heads. The practice reached its height in later Toltec and Aztec times. Even the few bark books left indicate that skull racks had become an integral part of civic architecture by that time.

Replacement of the Atlatl by Bow and Arrow in North America

The earliest known atlatl from North America comes from Lake Winnemucca, Nevada, located in the Great basin, and dates to the early Holo-

cene (10,250–8,000 years before the present). Others have been recovered from rock shelters and caves throughout the Great basin, the Southwest, and Baja California and as far east as the Ozarks in Arkansas and Missouri.

Operationally, the atlatl was composed of two parts: a handle and a dart. The handle was either carved or possessed one or two loops through which the hand or two fingers were inserted. Articulation with the dart occurred at the end opposite of the handle and was effected by a “male” or a “female” member or a combination of both. The “male” type dart handle contained a projecting part that was inserted into a concavity in the dart. The “female” type, on the other hand, possessed an indentation at its contact point with the dart. Consisting of these two parts, the atlatl was used by indigenous North Americans from the Late Pleistocene through the Middle Holocene, when it was slowly replaced by the bow and arrow.

When exactly the bow and arrow replaced the atlatl is unclear. In many parts of North America there was a significant temporal overlap between these two technologies. Based on arrowheads found in the Southwest, the Great basin, and the Ozark region, the first bow and arrows began to appear around 5950–3950 years before the present. For example, a decrease in projectile point size around 4,000 years before the present is commonly regarded as marking the replacement of the atlatl by the bow and arrow across the Great basin. On the other hand, replacement of the atlatl with the bow and arrow in the Plateau region appears to have happened several hundred years later. As indicated by a decrease in the overall width, and especially neck size, of the projectile points found along the Columbia River, the shift from atlatl to bow and arrow was complete approximately 2,000 years before the present. However, in parts of the eastern Woodlands, evidence indicates that the bow and arrow was not universally adopted until around 1,400 years before the present. Across all regions, however, adoption of the bow and arrow appears to have varied largely in response to social, historical, and environmental conditions.

WARFARE IN THE SOUTHEAST

During the Late Woodland period (ca. 500–1000 CE) in the region now referred to as the Southeast in the United States, evidence indicates that relatively large-scale forms of intergroup warfare took place. This period was characterized by population increases, growths in settlement size, and the saturation of the landscape with scattered family groups and small communities. As a result of these factors, prehistoric peoples of the Southeast during this period constructed palisaded villages as a defensive measure to the increasing

intergroup warfare. Furthermore, several small triangular arrow points have been found embedded in human skeletal remains from the period, indicating that peoples of the region were in regular conflict with other groups. Because these arrow points were manufactured from nonlocal chert, it has been concluded that warfare took place on an interregional scale and was not confined to just a few communities in one region.

Introduction: The Arts and War

The celebration of warfare, the accomplishments of the state's military, and the heroic deeds of individuals have long inspired the creation of art. In many cases this art is state sponsored, that is, leaders commission the creation of this art for their own political purposes, as was the case in Rome and Assyria. In other instances, the art is inspired by the individual artist's own interests, such as Sun Tzu's desire to write a manual on warfare, a desire that led to the creation of one of the world's great literary masterpieces. Sometimes what is now considered ancient art was not intended as such initially, as is the case with the Chinese terra-cotta warriors, clearly masterpieces of sculpture, yet the ancient sculptors never intended these life-size statues to be viewed by humans. What follows are some examples of the different ways in which the theme of war was explored by artists from 1000 BCE to 300 CE.

—Kevin M. McGeough

Sun Tzu and *The Art of War*

As the progenitor of East Asian military texts, *The Art of War* was purportedly written in the late sixth century BCE by Sun Tzu, also known as Sun Wu. From military strategy to modern business practices, from the formation of Chinese empire in the third century BCE to the establishment of the People's Republic of China in 1949, *The Art of War* remains one of the most influential treatises in political and military thought in East Asia to the present day.

The life of Sun Tzu is shrouded in obscurity. There is no mention of him in sixth-century records; an early Han period history compiled by Sima Quan (145–85 BCE) states that he was a contemporary of Confucius and was originally from the state of Qi but gained notoriety as a renowned general serving the state of Wu. If this is accurate, Sun Tzu wrote his treatise at the height of the Hundred Schools of Thought (722–221

➤ IMPACT OF *THE ART OF WAR*

Perhaps no other military treatise in the world has been applied to so many nonmilitary issues as has *The Art of War*. Throughout Chinese history, this treatise was a model for some Daoist movements that sought solutions to conflict embedded in everyday life. Even certain Daoist sexual practices that instructed men on how to “conquer” women by acquiring their Yin essence without transferring the men’s Yang essence are couched in the terminology of *The Art of War*.

The application of Sun Tzu’s wisdom to nonmilitary subjects continues to this day, most notably in the dog-eat-dog world of business. Inspired by postwar Japanese business tactics, many Western corporate executives adopted *The Art of War*, formulating in turn the “Art of Business.” Book after book promoting the tenets of Sun Tzu has been published since the 1980s interpreting the vocabulary of war for the average, ambitious Western businessperson. The “enemy” became business competitors, “territory” was reinterpreted as “the market,” and “planning” became “market analysis” in the lingo of the warriors of the capitalist world.

Sun Tzu, however, is not just limited to Asian history and business. Football coaches attribute their teams’ victories to its counsel. Self-help gurus proclaim its value as a guidebook for self-improvement. Political analysts proffer *The Art of War* solutions to government gridlock. Sun Tzu inspires strategies for improved Internet security. Even in Hollywood, *The Art of War* finds a place on the shelf of Tony Soprano. Wherever competition and conflict affect human society, individuals have been inspired by the words of Sun Tzu for over 2,000 years.

—David G. Nelson

BCE) when, amid the conflict of warring feudal kingdoms, Chinese culture experienced a proliferation of philosophical traditions such as Confucianism, Legalism, Daoism, and Yin-Yang. Whether or not Sun Tzu was a historical or merely legendary military figure, by the fourth century BCE the Sun family held a reputation as military strategists. Sun Bin (380–316 BCE) of Qi was a highly regarded military adviser and an author of his own military treatise that reflects the influence of *The Art of War*.

The origins of *The Art of War*, therefore, are uncertain. The earliest extant versions, written on bamboo strips tied together by silk thread, only date back to the third century BCE. The work in its current form is divided into 13 chapters, but these divisions do not always present a coherent theme. This seeming disorder combined with a succinct, sometimes overly simple writing style, similar to many other early Chinese texts such as *The Book of Changes* or the *Dao de Jing*, leaves the passages open to interpretation and readily applicable to nonmilitary pursuits. The influence of Daoism, Legalism, and Yin-Yang are apparent throughout the work, giving evidence to the treatise’s assembly, if not its creation, during the intellectual milieu of the Hundred Schools of Thought.

The Art of War presents overarching principles of military strategy, seldom delving into specific instructions for military organization, troop movements, or battlefield tactics. Underlying all of Sun Tzu’s writing is the concept of *shi*, or potential energy/advantage. Victory, the text proclaims, comes through the understanding and use of the *shi* in any given set of circumstances that a military force may face. In all of this, Sun Tzu reminds the reader that the successful general adheres to a sort of economy of energy, avoiding the wasteful use or destruction of resources, even those of the enemy. *The Art of War*, then, is a guide to attaining victory through the least-destructive means and proffers four basic principles that have guided military strategists for more than 2,000 years, namely adaptation, planning, deception, and leadership.

Adaptation refers to the use of *shi*. Like the Daoist sage, a superb general is aware of the natural ebb and flow of a given situation and has the ability to select the most economical means of attaining victory or, if need be, to avoid conflict altogether if the *shi* indicates imminent defeat. In order to understand the *shi*, the general must know both his own and the enemy’s strengths and weaknesses, the overall morale of the men in both camps, and the climate and the topography of the land. *The Art of War* returns several times to the subject of geography, providing an in-depth analysis of the kinds of land in which an army may find itself and the kind of offensive or defensive action to which the ter-

rain is best suited. All of these factors determine the shi, and the victorious general then accordingly adapts in order to align the shi with campaign objectives. Because every situation is unique, Sun Tzu excluded specific formulas for victory. Relying upon previously successful strategies will not necessarily lead to victory because it is impossible for the variables of any two similar situations to be identical.

The Art of War proclaims that planning and preparation are the key to victory, that the battle is merely an epilogue. After determining the shi of the circumstances at hand, one makes the appropriate preparations. The victorious general is one who has assessed his own battle readiness, improved the country's strength through alliances, and gathered intelligence on the enemy. *The Art of War* emphasizes the role of espionage for this reason; spies are a vital source of information about the adversary and hostile terrain and are to be carefully cultivated. Through proper planning and preparation—a show of force and strength—war may not even be necessary, thus adhering to the Daoist ideal that a true warrior will never have need to go to war.

Perhaps the most famous line of *The Art of War* is “The Way of War is a Way of Deception” (Minford, 6). After assessing conditions, the able general does everything in his power to redirect the shi to work in his favor. Trickery and espionage play an important role in the development of strategy. For example, Sun Tzu counsels against attacking a well-fortified enemy; instead, a wise commander encourages the defenders to take the offensive, thus negating their strength of defense. It is through deception that the skilled commander convinces the enemy that the weaknesses and strengths of the opposing armies are greater or lesser than they are in reality. By doing so, the enemy is convinced to act precipitously. Sun Tzu hints at several methods of achieving this deception on the battlefield, such as simulating disorder in the ranks or feinting at secondary targets to disguise the real object of attack. In addition, *The Art of War* promotes the use of spies to confuse the enemy and sow the seeds of discontent. Even enemy spies can be useful by turning them into double agents, thereby feeding false information to the enemy and fostering doubt or overconfidence in

order to encourage the enemy to make a move not in their best interests.

Ultimately, however, the character and ability of the commander determines victory or defeat. For Sun Tzu, a great general must be able to multitask. The general must be a tireless and astute observer of ground conditions and be shrewd enough to interpret gathered intelligence. He must be able to recognize or create key opportunities and exploit them immediately. Finally, he must have complete authority over his forces and be able to inspire loyalty and discipline among his subordinates. It is in this way that the general, adhering to the ideals of *The Art of War*, embodies the various strands of Chinese thought. He is the embodiment of Daoist harmony through an intuitive understanding of the universe. At the same time, he is grounded by Legalist principles of discipline that reinforce his authority and is tempered by an almost Confucian sense of moral leadership though a basic concern for the morale and well-being of his troops and a hesitancy to utilize destructive means. This combination of ideals makes Sun Tzu's precepts appealing and approachable to a broad spectrum of East Asian society, making *The Art of War* influential throughout the millennia not only in China but also in Japan, Korea, Vietnam, and more recently the Western world.

The Chinese Terra-Cotta Warriors

Terra-cotta figurines of humans or animals, made of baked or hardened clay, were a common form of artistic expression by ancient people. Terra-cotta has been unearthed across much

Terra-cotta warrior from the mausoleum of China's first emperor, Qin Shi Huang. (Lihui/Dreamstime)

of China and can be found across a wide range of historical periods. A highly significant discovery was of the terra-cotta warriors unearthed in the 1970s near Xian, China. These terra-cotta warriors were manufactured and interned more than 2,000 years ago as part of the elaborate burial site of the First Emperor of China, King Zheng of Qin, who died in 210 BCE. The artifacts discovered at this site remain unsurpassed in terms of the number, scale, variety, and level of technological sophistication as well as how much they reveal to us about the past. The Chinese terra-cotta warriors have been exhibited all over the world since their discovery, making them a symbol of the past glory of China along with other historic icons such as the Great Wall and Grand Canal.

Xian, located in the northwest of China in the basin of the Yellow River, is an area known

as the cradle of Chinese culture. With its strategic location and rich resources, it served as the base of the capital for the powerful Qin, Han, and Tang dynasties. By the nineteenth century, however, the region's glory faded as the desert crept in. In the 1970s, locals launched a large-scale well-drilling movement in this now-barren land. One of the drilling teams, while working near the ancient burial site of the First Emperor, stumbled into a terra-cotta statue, and thus began the unveiling of a unique historical site.

The digging has continued since this first accidental discovery. There are three pits, occupying an area as large as about 5 acres (56 square kilometers). The best preserved and best restored is Pit Number Two, which most visitors see. In this pit alone, about 8,000 warriors, 600 horses, and 100 chariots are housed by a large well-designed hall, all positioned in various battle formations. The warriors stand about 6 feet (180 centimeters) tall, larger than life-size. Many of the warriors wear armor made of leather or metal plates. Some of the warriors are standing, while others are kneeling on one leg, apparently prepared for battle. All of the warriors are equipped with actual weapons; while the wooden staffs of a spear tend to be rotted or entirely vanished, many metal swords remain intact, some still razor-sharp. The consistency in these weapons reveals that the state must have maintained arsenals that mass-produced weapons to specified standards.

Many parts of the terra-cotta warriors are apparently mass-produced, too. Their hands come in two forms, for example, either open or holding onto something. But each one of these warriors bears unique facial features, so much so that the scholars speculate that the makers modeled the terra-cotta after actual soldiers. Some warriors have beards, whereas others do not. Since their size is slightly larger than the average adult, it is assumed that the physically fit royal guards served as the models for the sculptors.

The Chinese terra-cotta warriors tell us a great deal about the dramatic social and political changes that occurred during the Qin dynastic period. The statues indicate that all of the warriors bound their hair together to make a notch on the top of the head, apparently a common practice in the military at that time, similar to

short hair for today's soldiers. This presents a sharp contrast to earlier practices related to hair. During an earlier period, the Western Zhou political order, founded in the eleventh century BCE, enforced elaborate rituals. Central to this political order was extended kinship groups that permeated the whole of society. Consistent with this attitude, body hair was considered one's inheritance from forefathers and was treasured; keeping one's hair long was a sign of filial piety. Gentlemen's hair tended to grow long and was left spread on the back. This custom might have worked during peacetime but likely was a nuisance on the battlefield. The Qin soldiers adopted a new hairstyle, perhaps better adapted to their social role.

Anyone who has seen the Xian terra-cotta warriors may well remember the confident and inspired expressions on the soldiers' faces. Indeed, the Qin soldiers were known for their high morale, earning a reputation as "troops of wolves and tigers" among their contemporary rivals. Such high morale stemmed from reforms initiated in the 330s BCE that continued through the next century. As a result of the reform, anyone, regardless of his family background, was promoted according to military achievement. Assigning roles based on merit was a new concept at that time, for most other warring states still held onto the old norms that only the noble of birth could move up the social ladder. It is no wonder that it was the Qin state that eliminated all other states and unified China.

The grandeur of the terra-cotta warriors also reflects the awe-provoking state power of the Qin. Located on the edge of the then-Chinese world, the Qin had long been a marginal polity, insignificant to the intrigues of the warring states. In his reforms, however, the Qin prime minister, Shang Yang, followed the principles of Legalist thinking that emphasize royal power, often at the expense of the hereditary nobility. For example, the state recognized and legalized private land ownership and thus levied taxes directly from the peasantry. This allowed the state to tap into a much larger pool of resources rather than relying on the smaller resources of the nobility; consequently, the state grew more powerful and took control of many aspects of social life. The standardization in the

manufacturing of military equipments as well as of the mass production of the terra-cotta warriors is only one manifestation of this strong state power.

The creation of the Chinese terra-cotta warriors owed much to one single person, Yin Zheng, who presided over the unification war in the late third century BCE. After the unification in 221 BCE, King Yin Zheng believed that his achievement surpassed any other rulers in the past and that the title "king" could no longer reflect his great accomplishment. He therefore adopted for himself a new title, *huangdi*, or "emperor." He thus became the First Emperor of China, while his son, in this design, would be the second, with the imperial line intended to last forever. Yin Zheng began to build his mausoleum long before his death. Believing that he might continue his powerful rule in the afterlife, he devoted a large share of the state resources to the building of this mausoleum. His imperial line did not last long, however, and his dream of carrying on his power in the afterlife was a vanity as well, but his intent and effort left behind among other things an invaluable treasure in his stern guardians, the terra-cotta warriors.

Assyrian Battle Reliefs

The Assyrians of northern Iraq dominated the ancient Near Eastern world from the ninth through the seventh centuries BCE. This period is called the Neo-Assyrian period, when the kingdom was at the height of its power and its charismatic rulers built palaces in the cities of Nimrud, Nineveh, and Khorsabad. Monumental relief sculptures on the palace walls celebrated the king in his various roles of office, illustrating royal feasts, religious ceremonies, building

► STELE INSCRIPTION OF KING TIGLATH-PILESER (737 BCE)

“[Foreign] lands larger [than] the territory of Assyria I captured.

Countless people unto its people I added;
I continuously herded them in safe pastures.
I [am] Tiglath-Pileser, king of Assyria,
who from East to West, personally conquered all
the lands.”

projects, hunting expeditions, and military campaigns. The fierce battle sequences documented the aggressive territorial expansion of Assyria and are rich with historic details that provide information on military equipment and techniques as well as the architectural and environmental features of enemy lands.

The late palace reliefs evolved with the growing complexity of the state, focusing on the king's role of heroic warrior. Battle narratives became more prevalent and more intricate in the palaces of Sennacherib (704–681) and Ashurbanipal (ca. 668–627) at Nineveh, whose reigns were incidentally plagued by rebellions. The sculptors began to release the narrative sequences from traditional registers, creating sweeping intricate landscapes. A famous example was Ashurbanipal's *Battle of Til-Tuba*, where the artist crafted a battleground of ordered chaos: the viewer was guided through the melee by following the doomed flight of the Elamite king, culminating in the gruesome display of his head in Ashurbanipal's arbor.

Although an Assyrian victory was always assured, the sequences were action-oriented and compelling, unfolding the siege from its initial assault to victorious conclusion. By portraying the invincibility of the Assyrian war machine and the harsh consequences of rebellion, the narratives discouraged potentially disloyal visi-

tors and palace officials. In Assyrian royal ideology, war was justified as a divine ordinance: a worthy monarch expanded the land of the state god Ashur and his peoples, bringing foreigners into the god's "flock." A fascinating yet disconcerting aspect of the Nineveh narratives was the prevalence of foreign captives and the care taken to represent them. The Assyrian artists documented the progression of deported families from their ravaged homelands, illustrating fathers carrying children on their shoulders and mothers with babies at their breasts. One special rendering captures a Chaldean woman stooping to give water to her thirsty child. A few scenes even depicted captives guarded in Assyrian camps, eating and making lively conversation with one another. Their faces were standardized and seemingly impassive, but the clever use of body posture and gesture conveyed actions and emotions.

The late battle narratives juxtaposed rebel warriors being tortured or killed with deportees who were relatively well treated and often illustrated with startling sensitivity. Like any good story, there is a thematic tension between triumph and tragedy, drawing the audience into the action. This perceptible tension may, however, have been more than a narrative device: scholars observe the existential anxiety that pervaded Mesopotamian art throughout the millennia, reflecting the belief that man's purpose was to placate a capricious pantheon of gods. The reigning monarch was the human mediator of their desires; the seeming ironies within palace propaganda may therefore have reflected the king's struggle to visually harmonize his practical and theological responsibilities as well as his dual role of invincible conqueror and moral shepherd.

The Greek Celebration of Victory over the Persians

In 479 BCE King Xerxes of Persia attempted to conquer Greece with an enormous army. Many of the Greek city-states formed an alliance and, against the odds, successfully repelled the invaders. While Greece had never been a politically unified region, the Greeks did have a sense of their collective identity through a common language, religion, and culture and a sense of pride in that identity. Their defeat of the Persians gave the Greeks an idea that their victory was due to divine favor. According to the Greek point of view, their civilization was part of an ongoing righteous struggle against the forces of tyranny. Their victory represented the greatness of Greece, civilization's triumph over barbarism, and divine punishment of the impious. These themes were expressed in the artistic programs on monuments of the fifth century BCE using mythological allegory.

The Temple of Zeus at Olympia, begun around 470 BCE, carried a sculptural program consisting of two decorated pediments at each end of the temple, six sculpted panels behind the columns of each porch, and the colossal cult statue of the god. The themes of this sculptural program were a tribute to the greatness of the Greeks. The east pediment showed the story of the founding of the Olympic Games. Games such as these were shared by all Greeks, a symbol of their unified front. The west pediment displayed an allegory of the savage versus the civilized, a battle between the savage centaurs (half-horse creatures) and the Greek warriors who were defending their women. The panels, or metopes, showed the labors of Hercules, the national hero and ancestor of the Greeks. The story of his labors recounted how he won glory defeating not only the monsters he fought but also the tyranny of the king whom he was serving. On the throne of the statue of Zeus inside the temple was a depiction of the Niobids who were killed because their impious mother had claimed to be greater than a mother of gods. Although a connection to the Greek victory over the Persians is not made explicit, implicitly the Greek viewer would be reminded of the Persian threat to Greece through these allegorical references.

THE PARTHENON METOPES

The four sides of the Parthenon contain sculptured panels, unified by a theme of civilization triumphing over barbarism. On the east side of the building was depicted the battle of the Olympian gods against their divine predecessors, the Giants. The gods had won this battle and the right to rule the universe. On the north side was shown the Trojan War, a tale of a unified Greece defeating a powerful kingdom of the east. On the west side were panels of the Greeks fighting the semianimal centaurs. The south side showed a battle between the Greeks and the legendary women warriors, the Amazons.

—Angela Murock Hussein

The decorative program of the buildings of the Athenian Acropolis was a celebration of Athens and its essential role in the defeat of the Persians. This was a significant place to celebrate the victory because the Acropolis had been sacked and occupied during the Persian invasion. Beside the entrance to the Acropolis was the small Temple of Athena Nike, a shrine to victory, specifically that of Athens over Persia. The Parthenon, an impressive temple to Athena, displayed decorated pediments, sculpted metopes on all four sides of the structure, a sculpted frieze around the inner building, and a large statue of Athena inside. The myths pictured in the metopes were all stories of warfare in which the forces of civilization defeated the forces of barbarism, more allegorical references to the war with Persia. Three of these same stories appeared again in elements of the cult statue of Athena inside the building. The pediments and the frieze on the temple's exterior glorified Athena and her city.

Roman Battle Reliefs and Arches

The Romans celebrated their successful military campaigns in a variety of visual formats, but two genres of military commemoration that are well preserved today are historical reliefs and arches. One of the earliest Roman historical reliefs now extant depicts a battle from the monument of L. Aemilius Paulus at the sanctuary of Apollo at Delphi, Greece. This depicts the Battle of Pydna (168 BCE) between the Romans and the Macedonian king Perseus. The theme of pitched battle continued to be a popular one on Roman reliefs for many centuries, with some of the most famous examples including the second-century CE Column of Marcus Aurelius and the fourth-century CE Arch of Constantine, both in Rome.

Some of the most famous martial reliefs in the Roman tradition are, however, depictions not of battles themselves but of events preceding or following the battles. Examples include the reliefs that depict triumphal processions

(victory parades) such as those on the Arch of Titus, which commemorates the capture of Jerusalem in 70 CE. Another example is the ribbon of scenes spiraling up the Column of Trajan (second century CE) that depict camp building, *adlocutio* (speechmaking), sacrifice, and other scenes related to Trajan's two Dacian Wars. The fact that these scenes far outnumber the few actual battle scenes on the column may have been intended to demonstrate that Trajan, whose background was military, also had the necessary civilian skills to make a good emperor.

Roman commemorative arches are sometimes known as triumphal arches because many of them are associated with generals who were granted a triumphal procession after a successful military campaign. The first commemorative arches were constructed in Rome by Lucius Stertinius in 196 BCE in the Forum Boarium and in the Circus Maximus to celebrate Stertinius's victories in Further Spain. Shortly thereafter, in 190 BCE, the victorious general of the Second Punic War, Scipio Africanus, built an arch on the Capitoline Hill.

These earliest commemorative arches served as bases for statues and statue groups. None of the arches from the second and first centuries BCE is now extant, but evidence suggests that they probably had a single passageway. The first arch to break from this pattern may have been the so-called Parthian Arch, built to celebrate the Parthians' peaceful return of the Roman military standards that were lost in battle in 53 BCE. This arch was built in the Roman Forum in 19 BCE, and both excavations and numismatic (coin) evidence suggest that it had three passageways. The coins also depict a four-horse chariot (*quadriga*) above the central arch.

Extant arches that still stand in Rome today include the Arch of Titus, the Arch of Septimius Severus, and the Arch of Constantine, the latter of which commemorates, among other things, the Battle of the Milvian Bridge in 312 CE, a key moment in Constantine's rise to power.

Ceramic Images of Moche Warriors

The Moche culture of Peru (100–800 CE) is noted for its particularly elaborate ceramic arts. Historians use the designs on these ceramics to reconstruct ancient Moche culture. One particularly noteworthy aspect of Moche life that can be reconstructed through the study of this pottery is warfare. Moche ceramics are replete with images of warriors, both modeled and painted. These figures are identifiable by their head-dresses, warrior garb, and implements. When modeled in three-dimensional form, they often appear kneeling and holding a club and shield. In the popular fine-line paintings, which occur on the bodies of numerous stirrup spout ceramics, the warriors perform a series of actions, termed the “Warrior Narrative.”

Warriors in Moche iconography commonly wear a conical-shaped helmet. Its displacement during combat signifies the defeat of the warrior. The warriors also regularly sport a back-flap, a trapezoidal metal sheet attached to the belt behind the body. The warriors commonly carry a shield—circular or square and too small to offer full-body protection—and a club, occasionally with a star or cone-shaped mace at the end. These objects have been found archaeologically in Moche contexts. There is further evidence of their use upon actual human sacrificial victims, based on osteological remains and objects recovered from the site of Huaca de la Luna in the Moche Valley, Peru. Other weaponry known from archaeological and visual contexts include spear throwers, spears, darts, and lances. Noting the verisimilitude of Moche iconography with material objects, it is significant that illustrated warriors fight largely with clubs and shields.

In the fine-line paintings on Moche ceramics, the warriors appear to progress through a series of actions (the Warrior Narrative). While

➤ MOCHE FINE-LINE PAINTING OF A WARRIOR AND EVENTUAL SACRIFICIAL VICTIM

The above image comprises half of a fine-line painted scene on a Moche stirrup spout bottle from a private collection. It depicts a nude victim with a rope around his neck and tattoos on his body. His conical helmet and club are carried by the victor behind him, who retains his apparel, helmet, club, and shield. The victor escorts the defeated captive through his grasp on the rope.

—Kimberly Jones

Moche Archive, University of California, Los Angeles. Drawing by Donna McClelland.

many bottles show only one aspect of the narrative, those that show more than one allow for a sequencing of events. In the opening scenes, Moche warriors are seen running in a row carrying their weapons. By the following scene, they are engaged in one-to-one combat, fighting with clubs. The victors often grab the hair of the defeated or apply a harsh blow to the chin. The defeated opponent, who often bleeds from the nose, is then stripped of his weapons and garments, which are tied in a bundle taken by the victor. The naked prisoners, with ropes tied around their necks, are paraded through a site plaza. The narrative concludes with prisoners having their throats cut and their blood

collected, to serve to a high class of individuals in the Moche ritual system.

Significantly, Moche warriors never engage in large-scale battles or fight identifiable non-Moche individuals. The warriors are uniformly Moche in dress and nature. Therefore, current scholarly consensus maintains that the Warrior Narrative scenes depict ritual battles and their resultant sacrifices, a sociopolitical system established by the height of Moche society, from around 400–700 CE. The representation of anthropomorphized animal and plant warriors in Moche iconography, such as deer and bean warriors, supports the interpretation of a ritual and symbolic nature of the various warrior scenes. Nevertheless, the presence of ritual warfare and its representation does not negate the possible role of warfare in a larger political arena of Moche conquest and control. The full nature of Moche warfare and the role of Moche warriors

may be clarified through ongoing research and debate in Moche studies.

Thought and Religion

At some point in the first millennium before the Common Era, Siddhartha Gautama (the Buddha) was born, became “awakened,” and died. Scholars debate much regarding the life of the Buddha, but all agree that his teachings arose out of a period of Indian history in which wandering philosophers, known as *shramanas*, sought answers about the meaning and purpose of life. Siddhartha found his answers after first giving up a highly privileged existence and second after giving up a highly ascetic lifestyle. For the Buddha, a life based on moderation (the Middle Path) and contemplation was the path to awakening. His teachings formed the basis of the spiritual/philosophical practice that came to be known as Buddhism, which spread throughout Asia in the period from 1000 BCE to 300 CE and remains today one of the major world religions.

One of the truly remarkable aspects of Era 3 is the flourishing of religious and philosophical thought that occurred throughout Asia, Africa, and Europe at this time. During this period, Judaism emerged as a distinct religion (as opposed to an ethnic/political identity), and the religions of Zoroastrianism, Christianity, Buddhism, Confucianism, Jainism, and Brahminical Hinduism, among others, emerged. Religious traditions that have not lasted to this day but remained influential also emerged; for example, this is the period in which the Greek myths as they are known today appeared. This was the time in which philosophy emerged as a distinct sphere of intellectual activity and the foundations for modern philosophical thought were established.

Based on the observation that these major revolutions in philosophical and religious thinking occurred in China, India, the Near East, and Europe at around the same time, Karl Jaspers described the period from 800 BCE to 200 CE as “the axial age” in his 1949 work *The Origin and Goal of History*. The name “axial” refers to the pivotal role that this period was thought by Jaspers to have played in world history, establishing norms of philosophical and intellectual meaning that were to have long-lasting impact. What Jaspers found particularly interesting was the similarity in thinking that occurred seemingly simultaneously in Greece, the Near East, India, and China and the similarities in the sociological context in which that thinking developed. Most similar among Axial Age thought was the newfound desire to attempt to understand the meaning of human life. In all of these regions, in Jaspers’s view, new groups of intellectual elites arose to grapple with these problems. Regardless of whether or not one agrees with Jaspers’s thesis about the similarities in revolutionary ideas in Greece, the Near East, Indian, and China at this time, it is without question that the period from 1000 BCE to 300 CE saw some of the most important developments in human thought.

Philosophy emerged as a systematic intellectual endeavor in sixth-century Hellenic Anatolia, an area known as Ionia where Thales attempted to understand how a world that constantly changes kept from falling apart. These abstract speculations may not have appealed to the majority of Greeks, but the idea of articulating reasoned opinions about the nature of the world did, and rhetoric (the art of speaking) and dialectic (the art of persuasive logical analysis) became skills taught by professional teachers called Sophists. However, it was in fifth-century Athens that the true giants of Hellenic philosophy emerged: Socrates, Plato, and Aristotle. Socrates believed that truth exists and that it can be discovered through reason. Socrates' follower Plato developed methods to explore philosophical questions and established the Academy in 386 BCE to train philosophers and statesmen. Aristotle, a student of Plato, broke away from his master. Aristotle and his students attempted to gather, order, and explain the world through observation and logic.

Numerous other philosophers and philosophies developed in the later Hellenistic period. Epicurus (ca. 341–ca. 270 BCE) and his followers (Epicureans) argued that the absence of pain was the greatest pleasure that one could achieve and argued that humans should attempt to live happy lives by leading simple lives. The Cynics argued for a different approach to life, rejecting any type of convention in order to pursue virtue. The Stoics also sought virtue and believed that control of one's emotions and behaviors would help lead to moral excellence. Platonic philosophy continued to inspire thinkers, and modern scholars refer to these later scholars who built on the works of Plato as Neoplatonists. This school of thought had a tremendous impact on Christian thinkers.

Despite the fact that most modern philosophers see the origins of their discipline in the Greek world, philosophy developed concurrently and possibly in tandem with thinkers in India and East Asia. It is difficult (and perhaps meaningless) to separate philosophy from religion in Asia between 1000 BCE and 300 CE. The religions of Confucianism, Jainism, and Daoism, all of which are still practiced today, originated in this period and offered complex philosophical systems to help understand the world. Hinduism, better thought of as a family of religious beliefs and practices rather than a single religion, continued to develop alongside these traditions.

Similar philosophical concepts found across Eurasia may have been shared, although scholars are often divided as to where these ideas originated. For example, the concept of transmigration of souls, in which the dead forget their past memories and move on to a new existence, can be found in both India and Greece after 1000 BCE. The earliest references to this idea can be found in the Indian *Bhagavad Gita*, and it later appears in Greek Pythagorean thinking. South Asian thought may very well have influenced Greek thought, although the exact nature of this transmission of ideas is unclear.

The spread of Gnosticism is another situation in which it is clear that many diverse traditions were blended together. Gnosticism itself was a diverse series of belief systems and movements that, generally speaking, understood the Hebrew Bible in light of Christian teachings and Greek philosophical and mystery traditions. Beliefs and practices varied

considerably, but in general, Gnostics believed that the human soul is divine but is trapped in a material world created by an imperfect god (usually understood as the god of the biblical Patriarchs), referred to by Gnostics as the demiurge. A superior divinity, often called the Godhead or Pleroma, although the nature of this divinity is not consistent through Gnostic teachings, exists above the material world. Some have suggested that Gnostic notions were inspired by the Upanishadic tradition (in India), which teaches that the individual *atman*, or soul, is a spark of Brahman, the Universal Soul, and release from suffering (*abimsa*) comes with knowledge of that cosmic divinity within oneself. Whether or not there was a direct connection (the origins of Gnosticism are debated by scholars), this was certainly a religious system that was seen as relevant outside of the Greco-Roman world. Mani (ca. 216–276 CE) was greatly influenced by Gnosticism, and his teachings became foundational for Manichaeism in Persia. Gnostic ideas were also transmitted along the Silk Roads; some Gnostic texts have been found in Turfan (in what is now China).

As with Gnosticism, Greek mythology was influential well beyond the Greek world. The stories of the gods and goddesses of the Greeks continue to capture the imagination of people today, long after the religious values associated with these stories have vanished. Western art continues to be imbued with images derived from these Greek stories. While myth and mythology have relatively general meanings (and very different meanings depending on the context), Greek mythology is typically taken to be the stories of the gods and heroes of the ancient Greeks; often these stories were told as a means of understanding natural phenomena, understanding the origins of humans and the world, and understanding the basis of ritual and cultic practices. Unlike Judaism, Christianity, and Islam, there was no prescribed canon of religious texts and beliefs. Although much mythological material was written down by Greek authors, none of these writings were considered authoritative in the way that the Bible came to be understood.

For other religious traditions, religious writings became or started to become authoritative after 1000 BCE. Many of the sacred scriptures produced between 1000 BCE and 300 CE are still used in worship communities today. Compilation of the Jewish and Christian Bibles began at this time, the literature of Hinduism was written down, and the seminal texts of Confucianism and Daoism appeared. Texts started to become fixed, that is to say, the religious traditions established certain works as holy and different from other types of writing. Thus, Christian writers could compose commentaries on the Bible, but these had a different sacral quality than the books of the New Testament.

Sacred scriptures were not the only innovations of this era. This was when monotheism (the belief that there is only one god) first appeared, a religious concept that would eventually come to dominate the religious

Beliefs and practices varied considerably, but in general, Gnostics believed that the human soul is divine but is trapped in a material world created by an imperfect god (usually understood as the god of the biblical Patriarchs), referred to by Gnostics as the demiurge.

traditions of much of the world. Prior to 1000 BCE, there is evidence for *henotheism* or *monolatry*, the belief that one god is significantly better than other gods and that it is best not to worship the other deities. However, it is really sometime after 1000 BCE (although scholars disagree about the details of this development) that the people of the kingdom of Judah began to believe that there was actually only one god. This became a central belief of Rabbinical Judaism and Christianity, which emerged out of the belief and worship system that certainly was evident in post-Exilic Jerusalem, that is, after the sixth century BCE.

Another elemental religious concept that emerged in late Hellenistic times and found expression in the so-called Mystery Religions, especially the cults of Isis, Serapis, and Mithras, Mahayana Buddhism, Bhakti (the cults of Shiva and Vishnu in Tamil India and across the waters of the Bay of Bengal), Christianity, and Manichaeism, among others, was that of a universal savior deity. This savior was a deity who took on himself or herself the sins and cares of all believers and offered devotees some sort of release from the burdens of suffering and often, also, offered protection in this world. Thus were born world religions in many respects, since these were deities that, at least from the perspective of their faith communities, held universal appeal. This idea of a savior was so widespread that a number of Hellenistic rulers claimed the title, such as the mid-second-century BCE convert to Buddhism, Menander I Soter (Savior).

Fundamental to the emergence of this notion of a savior was the phenomenon of personal piety in which believers felt that they had a personal relationship with the deity. This had existed to some extent in Egypt and Mesopotamia and among the Israelites prior to 1000 BCE. Believers would offer prayers or sacrifices directly to deities in return for the favor of that deity (as opposed to other traditions whereby these offerings would be made through a cultic or political intermediary). However, the notion of a personal relationship with a deity became more central to the Mystery Religions of Greece and Rome and in Christianity and Judaism. Prior to 1000 BCE, temple worship had mostly been limited to cultic specialists, and in many ways temples were better thought of as the houses of the deities rather than places for humans to worship. The movement toward personal piety did not just occur in the Greco-Roman world. In India and Southeast Asia, individual worshippers, Hindus, and Mahayana Buddhists would enter temples or shrines in order to encounter the divine directly. Between 1000 BCE and 300 CE, temples, churches, shrines, and synagogues emerged as places where believers could enter to participate as members of a worship community.

Another new phenomenon that emerged in this era was monasticism, from the Greek *monas*, a solitary thing or person. Monasticism first emerged in India and then spread to East Asia and the Greco-Roman world. The core concept underpinning monasticism is that it is beneficial for worshippers to remove themselves from the profane everyday world and devote themselves solely to the worship of their deity. Monastic communities emerged in which participants solely focused on religious practices and the cultivation of theological understanding. By the end of this period, around 300 CE, these monastic communities had become very influential in matters of ritual and theology throughout

Eurasia and parts of North Africa. Later some of these monasteries, especially in India, would also become centers of secular learning.

With these notions of personal piety, the notion of a universal value to the relationship with the deity emerged. Christians, Buddhists, Manichaeans, and Saivites began to believe that their religious teachings were applicable to all people. Thus, missionaries spread universal religious messages in an effort to save all of humanity, not just those humans with whom they felt an ethnic or political connection. This approach to religion appears on a massive state-sponsored scale in Aśoka's Maurya empire but comes to be a hallmark of political enterprises in later periods. Likewise, the spread of religions throughout the Afro-Eurasian ecumene is readily apparent by 300 CE.

■ Introduction: Development of Philosophy in Greece

The development of philosophy in Greece was one of the most significant intellectual developments in human history. The philosophical practices of the ancient Greeks have shaped our thinking about our world (and how we think about thinking about our world) and have profoundly influenced Western thought. Even today, Plato is the most-quoted philosopher of the European tradition; the intellectual ponderings of the ancient Greeks have had relevance far beyond the Hellenic world.

This Greek philosophical system lies at the foundation of the modern European discipline of philosophy. Generally, Greek philosophy is subdivided into two broad historical frameworks. The first stage of Greek philosophy began with Thales of Miletus (ca. 600 BCE), and he and those who followed him are normally referred to as the pre-Socratics. These thinkers, best thought of now as natural philosophers, looked to the natural world and tried to understand its origins and workings. They explicitly rejected mythology (as well as the writings of Hesiod and Homer) as legitimate explanations for the natural world and looked to find explanations within the natural world itself. This was a profound break from the types of scientific inquiry that had come before and established the separation between philosophy and theology that has remained fundamental in the West up to the present.

The second stage of Greek philosophical inquiry comes with Socrates of Athens (469–399 BCE). His works, which are preserved in the works of his student Plato (427–348 BCE), profoundly altered Greek philosophy. Socrates turned the examination of the world inward and pioneered the use of inductive reasoning to gain understanding in hopes of finding universal truths. His student Plato constructed an entire philosophical system on these universal truths (referred to as Platonic ideals), which, especially in the metaphysical arena, profoundly influenced Western thinking. Here, for example, is the intellectual basis of beliefs about the soul and body dualism that lie as fundamental in Western religious systems. Plato interacted with students in what must have been one of the most inspirational learning environments in world history, the Academy in Athens. One of Plato's students there, Aristotle (384–322 BCE), would come to be at least as influential and arguably more influential than Plato (their relationship was marked by significant disagreements). Aristotle provided the foundation for many intellectual pursuits in fields as varied as ethics, the natural sciences, law, and politics. Later philosophical schools developed out of these traditions, and it is usually possible to identify Platonic or Aristotelian tendencies in the writings of later thinkers.

It is not possible to detail all of the main features of Greek philosophy. The following entries provide a historical introduction to this ancient intellectual pursuit with guides to further reading on the subject.

—Kevin M. McGeough

The Questions of Ancient Greek Philosophy

Philosophy asks the most basic questions of life. These include questions about how to achieve knowledge, about the nature of reality, and about what ought to be done. There is an important sense in which every human society has answers to these questions. Explanations to basic questions are given in order to find meaning in the world. However, philosophy arises when traditional answers are questioned and solutions sought through analysis. When explanations fail to provide meaning, it is a common pattern that the antithesis will be given as an alternative explanation. The move to the antithesis raises new logical problems that if not successfully addressed result in the failure to find meaning and the rejection of the new explanation in favor of skepticism.

The development of philosophy in the West is traced to a shift from personal/supernatural explanations to naturalistic explanations that occurred in Greece around the sixth century BCE. Personal explanations, referring to the activities of gods or other personal beings, were commonly given as explanations for events: fertility or famine, health or plague, victory or defeat. They were also relied upon to explain origins: the origin of the cosmos, of good and evil, and of humans and human history. These are exemplified in the Homeric epics that served as the foundation for the Greek worldview.

Thales is said to have started traditional Western philosophy when he correctly predicted an eclipse in 585 BCE. He identified the fundamental substance out of which all things are made as water. He seems to have come to this conclusion for empirical reasons, such as the different forms that water takes (solid, liquid, gas) and that it is necessary for life. Others followed his empirical approach but identified

other fundamental substances, such as air (Anaximenes) or fire (Heraclitus). In contrast, some argued for a substance that is beyond empirical investigation, such as Anaximander's *apeiron*. This is said to be unrestricted, unlimited, and boundless in its nature; it is the substance underlying all phenomena of experience but is not any specific phenomena. Similarly, Parmenides argued that ultimate reality is permanence (in contrast to Heraclitus's fire/change) and that any experience of change is unreal.

This search for the underlying substance of reality led to new logical problems, the most important being the "one and the many." If all things are made of water, then how can there be a diversity of beings, some of which are not wet? Or if plurality and diversity are the fundamental reality, then in what sense can there be sameness or one? This raises questions about the validity of sense experience: Is change an illusion? Can the senses be relied upon for ultimate truth, or must the mind reason beyond the senses to get to reality?

The inability to come to unity about the nature of reality and the approach to take in seeking knowledge led to a rejection of the basic beliefs that formed the foundation of naturalism. Because supernaturalism had also been rejected, the result was skepticism about foundational questions. This has been a pattern that is repeated in the history of Western philosophy. Questions about the nature of ultimate reality are addressed, but because of uncritically held assumptions (both about reality and about how to come to knowledge about reality) the answers are seen to be insufficient, and the foundational questions are not answered.

The age of the first Greek philosophers was followed by an age of skepticism in which sophists focused on rhetoric and persuasion rather than knowledge. Using cultural relativism and the failure of earlier philosophers to support their skepticism, the transition to persuasion provided a framework for Socrates to begin his questioning. Socrates has stood out as a paradigm for the philosopher because he asked questions to address the assumptions of others. These two patterns can be helpful in understanding the development of subsequent philosophy in the West: uncritically held as-

sumptions lead to skepticism due to a failure to establish a foundation for knowledge; critical examination of those assumptions through raising questions about them brings greater clarity about the issues and greater understanding of how to solve philosophical problems at the foundational level.

Fifth- to Fourth-Century BCE Philosophical Developments

The hallmark of Greek philosophy was the courage to trust argument as much as observation and to trust both in preference to tradition. The major philosophical figures of fifth- to fourth-century Greece are the pre-Socratics, Socrates (469–399 BCE), Plato (ca. 428–ca. 348 BCE), and Aristotle (384–322 BCE).

The pre-Socratics attempted primarily to explain the world as a whole and the physical objects in it. For the development of philosophy, Parmenides is perhaps most important, for much of ancient physics and metaphysics consists of attempts to refute or modify Parmenides' difficult claims.

Socrates, however, found such things unfulfilling and focused almost exclusively on ethics. By exploring what it means to become excellent (or "virtuous") as an individual human being, he sowed the seeds of ancient ethical theories to come but never found his own or others' ideas satisfactory. He assumed that human excellence was or would lead to the goal of humans, well-being/happiness, that he called "eudaimonia." Subsequent ancient theories were all eudaimonistic. His "intellectualism" assumed that excellence is exclusively a matter of knowledge: knowing the good is sufficient for doing it, he claimed. He was condemned to death by the

➤ WHY SOCRATES STAYED IN PRISON

In *Crito*, Socrates speaks to Crito, who wants to help Socrates escape from prison and the death sentence:

"We must therefore examine whether we should act in this way or not, as not only now but at all times I am the kind of man who listens only to the argument that on reflection seems best to me, I cannot, now that this fate has come upon me, discard the arguments I used: they seem to me much the same . . . if we have no better arguments to bring up at this moment, be sure that I shall not agree with you."

Plato, *Crito* 46b, translated by G. M. A. Grube, in John M. Cooper, *Plato: Complete Works* (Indianapolis, IN: Hackett, 1997).

Athenians for his teachings and beliefs and became a martyr for philosophy.

Plato, our single best source for Socrates' thought, apparently began as an explicator of Socratic ideas and then moved on to explaining his own ideas, largely via synthetic explanation of large ideas. The *Republic*, for instance, starts out with the question "What is justice?" and proceeds to lay out an explicit epistemology, ethics, and metaphysics as well as political philosophy and psychology. Combining a Socratic ethical question with the Parmenidean challenge and Pythagorean mathematical ideas, Plato espoused an ideal unchanging reality of Forms that are only imperfectly found in sensible things. In his "late" dialogues, he severely questioned and may have abandoned the Forms. Plato's writings present a problem, however: they are almost entirely dramatic rather than in propria persona. They seem to be divisible into an early and more tentative Socratic ethical phase, which involves more lively drama, and a middle and later phase that is more dogmatic and expands into epistemology, physics, politics, aesthetics, cosmology, and ontology.

Aristotle surpassed Plato's breadth of interest but took an analytical turn. Aristotle's huge

surviving corpus of works consists of analytical explorations of particular topics. He constantly classifies and analyzes into constituent parts. Logician, biologist, botanist, physicist, metaphysician, ethicist, political theorist, rhetorician, literary theorist, psychologist, meteorologist, and more, Aristotle looms preeminent in Western thought. Aristotle's formal logic was the first and was not superseded until modern times.

There were a number of other important philosophers of this era. Pyrrho (ca. 365–ca. 275 BCE), about whom little is known, was the first to proclaim skepticism as a philosophy, which was to blossom in various forms in the next centuries. Protagoras, Socrates' contemporary, claimed that human perception and thought were the arbiters of reality (Plato's *Theaetetus* expands and attempts to refute that claim) and was thus a relativist. The atomists, Democritus (born ca. 460 BCE) and Leucippus (fifth century BCE), claimed that atoms (invisible units having only size and shape) and void were the bedrock of a purely materialistic philosophy that was the chief ancient alternative to the teleological philosophies of others.

Ancient philosophy was an alternative to and supplement to traditional education of youths, which made it politically and societally important. In Athens, Plato set up his Academy, a private school, and Aristotle his Lyceum, more open to the public, both distant precursors to modern higher education.

Pre-Socratic Philosophy

“Pre-Socratic philosophy” refers to Greek thought mostly preceding Socrates and explaining primarily the world as a whole (the “cosmos”) and objects in it via rational original theories rather than through traditional divinities and mythology. In distinction from their non-Greek neighbors, these Greeks pursued

causal and generalized explanations. They did not simply observe that something happens or exists; they theorized why.

The traditional groupings of the major pre-Socratic thinkers are Ionian Physicists (Thales, Anaximander, and Anaximenes), Heraclitus, Eleatics (Xenophanes, Parmenides, Zeno of Elea), reactions to Parmenides (the pluralists Empedocles and Anaxagoras and the atomists Democritus and Leucippus), and Pythagoreans. For each, compiling the ancient evidence (which consists of paraphrase and fragmentary quotations from their writings) yields a largely consistent but speculative picture, some highlights of which are as follows.

The Ionian Physicists offered explanations of the origins, structure, and material causes of the universe based on analogy, logic, and mathematics. Thales (sixth century BCE), the first philosopher, a monist, claimed that water was the only basic stuff of the world. He introduced geometry and astronomy to Greece (from Babylonians). Important assumptions he made, which his successors shared, were that the universe is structured, intelligible, and teleological in nature. Anaximander (610–ca. 546 BCE) said that the basic stuff was *to apeiron*, “the unlimited” (an undifferentiated stuff to which things return eventually), created a geometric model of the universe, and made a map of the earth and the heavens. Anaximenes (fl. ca. 545 BCE) said the basic stuff was air and explained the apparent diversity of the world as density variations: a quantitative principle that explains qualitative difference as well as a principle of conservation of matter through change.

Xenophanes (ca. 560–ca. 478 BCE) argued, based on the logic of divinity, that there was only one entirely good god but that humans thought of gods in their own image.

Parmenides (born ca. 515 BCE) argued by force of logic that everything is one, with no past, present, or future, unchanging and unchangeable, for no thing can come from nothing. His poem contains the first extant sustained pure logical argument of the Western tradition. In a way, much of subsequent ancient philosophy attempts to resist Parmenides' conclusions. Like Parmenides, however, his successors thought that the real world is quite different from the world we perceive.

Heraclitus (ca. 540–ca. 480 BCE) claimed that the world consists of processes rather than stable things and that opposites are merely different aspects of the same thing.

Anaxagoras (ca. 500–428 BCE) held that everything has infinite parts, among which are the “seeds” of every other thing: a thing appears to be X because of the predominance of X seeds in it. The differentiation of things is caused initially by the principle of intelligence, but subsequent developments are mechanical.

Zeno of Elea (495–430 BCE) was a follower of Parmenides whose arguments start from the assumption that Parmenides was wrong and deduce paradoxical results. His paradoxes reflect the difficulty that humans have comprehending continua. Often dismissed, the paradoxes are fundamental and in many cases still defy solution.

Empedocles (ca. 490–ca. 430 BCE) held that there are four basic stuffs (earth, air, fire, and water) acted upon randomly by two principles (love and hate) and that something like survival of the fittest accounts for the currently existing living beings.

Leucippus (fifth century BCE) and Democritus (460–370 BCE) met Parmenides’ arguments with the claim that two things exist, the void and atoms. Atoms are microcosmic and indivisible and have no sensible qualities other than tactile qualities such as shape and texture, which are used to account for the apparent variety in the macrocosmic world.

While all of the above are historically connected to each other, Pythagoras (ca. 580–ca. 500 BCE) is distinct from the rest. He apparently imported the doctrine of the transmigration of souls from the eastern Mediterranean, but he also claimed that the fundamental basis of things is a matter of number and numerical proportion. His Pythagorean successors discovered that certain relationships cannot be formulated as a ratio of integers (the sides of a regular square and regular pentagon, for instance), a fundamental fact that led to great mathematical advances.

➤ PARMENIDES—A FRAGMENT

“That which is there to be spoken and thought of must be . . . Nor was it ever nor will it be, since it is now, all together, one, continuous. For what birth will you seek for it? How and from where did it grow? I will not permit you to say or to think [that it grew] from what is not; for it is not to be said or thought that it is not. What necessity would have stirred it up to grow later rather than earlier, beginning from nothing?”

Socrates

Socrates (470–399 BCE) has long been considered one of the most influential philosophers in Western intellectual history. Socrates lived in Athens, and because of his father’s close relationship with the son of Aristides the Just, one of the founders of the Delian League, Socrates was familiar with the life of the privileged class. As a young man he served with noted courage in the Peloponnesian War, but his fame and notoriety came from his philosophical speculation, particularly as he engaged with the citizenry of Athens. Although he wrote no known works, his thought and manner of argumentation were captured in the writings of Plato and Xenophon.

Mediterranean philosophers prior to Socrates emphasized what came to be known as natural philosophy, that is, the study of fundamental and basic aspects of the natural world. These natural philosophers addressed issues of basic metaphysics and epistemology, such as what and how many kinds of elements constituted the natural world and how this could be known. Socrates was said to have “brought philosophy down from the skies” by focusing less on such issues and more on questions concerning social, political, and personal issues, such as the nature of the good life or of social justice or friendship.

What came to be referred to as the Socratic method involved both content and process. The

➤ SOCRATIC IRONY

Later commentators on the life and thought of Socrates often speak of Socratic irony. This is in reference to the style of Socrates' inquiries and dialogues. In the course of asking others about some topic, Socrates would frequently remark that he knew nothing and the person with whom he spoke was knowledgeable and wise, which is why Socrates sought him out. The result, however, was always the same: the wise citizen was shown by Socrates not to be wise and knowledgeable but opinionated and ignorant. Many commentators have claimed that one of his goals was not sincerely to seek truth from his fellow citizens and that his own professed lack of understanding was feigned.

—David Boersema

content of Socratic inquiry took the form of asking “What is X?” where X would be topics with content such as friendship, piety, love, knowledge, and justice. The method of such inquiry was to ask someone who was considered to be knowledgeable about a specific topic and then to seek clarification on it via a series of questions and objections to proposed answers. This process of question and objection usually took the form of seeking a definition of some concept, such as piety. In asking for a definition of some topic, Socrates claimed that he was seeking not simply a list of examples but the essence of the topic. For example, in asking “What is knowledge?” and demanding an answer that would enunciate explicit criteria for anything to be knowledge, Socrates set the tone and direction for much of philosophy in the West ever since. This insistence on conceptual clarity by means of providing necessary and sufficient conditions for understanding what a basic concept is became, and to a large extent remains, a hallmark of Western philosophy.

The result of Socrates' interrogations of his fellow Athenians rarely led to resolution or even consensus about the topic at hand. While many young people, including most famously Plato, were supporters of Socrates' goal of desiring genuine wisdom, many others found his activities as a gadfly less admirable, and the well-known dramatist Aristophanes even satirized Socrates in his play *The Clouds*. Because Socrates often irritated

and publicly embarrassed some of his fellow citizens, he was several times in his life accused of misconduct. Most famously, late in life he was brought to trial for impiety and corrupting youths. Although he denied such accusations, Socrates maintained that his activities were always in the service of truth and the public good. He was found guilty and sentenced to die, which he did by drinking hemlock while in jail and thus ensuring his legacy as a martyr to truth.

Plato

A Greek philosopher, Plato aimed to systematize all human inquiry and all knowledge derived from this inquiry. At the core of his system was Socrates, the protagonist in Plato's dialogues: a questioner in the early dialogues and an imparter of wisdom in the middle and late dialogues. Whereas Socrates seems to have concerned himself with learning how to live an ethical life, Plato wanted to understand how proper conduct related to politics, law, mathematics, and science. If all knowledge was part of a system, then every insight was related to every other insight no matter how disparate they might seem. Although he had predecessors, one might assert that Plato, through his writings, was the first to systematize the study of philosophy.

Plato was born in 427 BCE in Athens, a small Greek city with a flourishing civic life, much of it focused on the forum. There the men met to discuss matters of state, lawyers conducted trials, teachers taught their students, and merchants sold their wares. People talked among themselves about trivial and consequential matters. Sophists visited from other cities to seek

➤ BOOK II, *THE REPUBLIC*

In *The Republic* Plato wishes to argue that the philosopher should prefer justice to injustice, but he begins his discussion of justice, as he did in other contexts, by making injustice seem preferable to justice. His task, of course, will be to rebut his own arguments about the superiority of injustice. Accordingly, the reader should not conclude, despite this passage, that one should be unjust rather than just.

“No (unjust man) could endure to hold back from another’s goods and not to touch, when it was in his power to take what he would even out of the market without fear, and to go into any house and lie with anyone he wished, and to kill or set free from prison those he might wish, and to do anything else in the world like a god. . . .

The (unjust man) will hold public office because he is thought to be just; then he will marry into any family he chooses, and give his children to marry

anyone he chooses, and make partnerships and contracts with any he likes, and besides all this he will benefit by gaining profit because he does not mind being unjust. In legal actions public or private, he will overcome and get the better of his enemies; and by this he will grow rich and able to benefit a friend and hurt an enemy, and to sacrifice and dedicate offerings to the gods properly and magnificently, and to serve gods and men, if he will, much better than the just, so that he may reasonably expect that the gods will care for him more than for the just man.”

—Christopher Cumo

The Republic, translated by W. H. D. Rouse, in *Great Dialogues of Plato* (New York: New American Library, 1956), 157, 159.

payment for instruction. Born into an aristocratic family whose members had directed affairs for generations, Plato intended to enter politics. As a young man he had come to esteem Socrates and was among his followers. Socrates’ trial and execution shocked Plato, convincing him to abandon a life in politics and prompting him to write his first dialogue, the *Apology*.

In the *Apology*, Plato defended Socrates from his accusers and expanded his method of inquiry. Plato depicted Socrates, in contrast to the sophists’ claim to knowledge, as a man who knew only what he did not know. Socrates’ execution led Plato to question whether government, oligarchy, tyranny, or democracy could be just or whether any form of government would have executed Socrates. The *Apology* was part of a trilogy to which Plato appended *Crito* and *Phaedo*. In *Crito*, Plato writes of Socrates’ commitment to virtue. Accepting his verdict of death despite its injustice, Socrates refused to escape jail and go into exile. Early dialogues, the *Apology* and *Crito* show Socrates to have been a questioner more than a possessor of wisdom. The wisdom Socrates had, Plato wrote, was in knowing the limits of his knowledge. *Phaedo*, however, was a dialogue of Plato’s maturity, one

of his middle dialogues. In it Plato presented a new Socrates, a man who had wisdom and wished to impart it to his followers. In *Phaedo*, Plato expressed certitude that people survive death. This certitude contrasted the agnosticism of the *Apology* in which Socrates, Plato tells the reader, was content whatever the prospects for survival. If death was final it would be an unbroken sleep untroubled by dreams. In *Phaedo*, by contrast, Plato rejected this view of death. Instead, he attempted to prove the soul’s immortality. For Plato, the soul was a person’s rational self or intellect. The rational self comprehended knowledge. This knowledge was independent of the senses. A triangle, for example, cannot be known by the senses, for every attempt to depict a triangle will be imperfect. The intellect alone can know what a triangle is. Because the rational self alone can know what a triangle is and because a triangle is immaterial, the soul that comprehends it must also be immaterial.

Plato’s interest in mathematics derived from his visit, around 387 BCE, to southern Italy and Sicily. These parts of the Mediterranean basin espoused mathematician and philosopher Pythagoras’s enthusiasm for mathematics as a system for comprehending reality. From his exposure to

Pythagoreanism, Plato concluded that the rigor and logic of mathematics could lead the philosopher to understand human behavior and the regulation of behavior in legal and political systems. In the *Republic*, one of his middle dialogues, Plato recommended the study of mathematics to young philosophers-to-be.

Beyond the study of mathematics, Plato wished to comprehend perfect justice, perfect truth, and perfect beauty. Perfect justice, for example, was not to be found in any judicial system. From culture to culture the definition of justice varied. This variance did not mean that justice was relative but that justice could not be known by comparing different judicial systems. Rather, the rational self alone could know perfect justice as an object of thought. Perfect justice was as real as a rosebush. In fact, perfect justice was more real than a rosebush because plants die. In contrast, perfect justice was, like the soul, immortal and unchanging. Perfect justice existed beyond time, whereas rosebushes and all other living things existed in time.

Plato believed that the soul, being immortal, had all knowledge but that much of it was latent. The philosopher, through careful questioning, helped the soul recollect this latent knowledge. In *Meno*, a middle dialogue, Plato, in the guise of Socrates, questioned a slave who had never been taught geometry, leading him to solve a geometric problem. Yet this knowledge could be obscured. In the *Republic*, Plato depicted a group of people chained in a cave. They face a wall and so cannot see the light from the sun that enters the cave. The only light they perceive indirectly comes from a fire behind them. The light from this fire casts shadows on the wall, and the chained people believe that these shadows are all that exists in the world. These fleeting images entertain them, and they give prizes to whoever can guess the proper sequence of images. Only with difficulty will a person free himself, climb out of the cave, and discover that reality is much greater than he had supposed. The philosopher, of course, will make the transition from shadowy realm to the sunlight of reality. Were he to return to the cave with his knowledge of reality, the others, hearing his incredible story, might kill him in disbelief and anger.

One authority credits Plato, in establishing the Academy in Athens, with creating the pre-

cursor to universities. At the Academy, scholars conducted research in all areas of knowledge. Students learned from these scholars, often assisting in their research. Among the pupils attracted to the Academy was Aristotle, who would become Plato's student.

Plato's dialogues have been universally popular and since their inception have been part of Western civilization. Even during the Middle Ages, scholars did not forget these dialogues. All subsequent philosophy owes a debt to Plato. American philosopher and mathematician Alfred North Whitehead commented that philosophy is a series of footnotes to Plato. Others have equated philosophy with Plato's dialogues. Today these dialogues are ensconced in the curriculum of many universities. Introductory courses traditionally require students to read selections from Plato's dialogues in order to acquaint themselves with the major issues in philosophy. In this context, the dialogues are the starting point for students wishing to study philosophy. Professional philosophers write commentaries on Plato's dialogues. Others, borrowing from Plato, write their own philosophical tracts. Still others write biographies of Plato, bringing his life and times to a wide public. Thanks to the work of publishers and professors, Plato is today probably better known than he was in antiquity. He is arguably the best-known philosopher of antiquity and, with the possible exception of Jesus, the best-known person from the ancient world. Reaching old age, Plato died in 347 BCE.

Aristotle

Aristotle (384–322 BCE) was the son of the court physician to Amyntas II, king of Macedon. His father died when Aristotle was young, and subsequently he was sent by his uncle to Athens. Here he studied at Plato's Academy for 20 years, until Plato's death in 347 BCE. Five years

➤ SYLLOGISTIC LOGIC

Among the many enduring legacies of Aristotle was his work in logic. He is credited with having systematized and formalized the study and enunciation of structures of reasoning and inquiry. Especially renowned and still taught today is his categorization of forms of inference into deduction and induction, labeled syllogisms. Aristotle identified numerous argumentative and inferential

structures as well as means of determining valid versus invalid forms of reasoning. Syllogistic logic was acknowledged for centuries as capturing and constituting all forms of inference and implication, being seriously supplemented only beginning in the nineteenth century.

—David Boersema

later Aristotle was invited to supervise the education of the son of the then-king of Macedon, Philip II. The son later became famous as Alexander the Great. In 355 BCE Aristotle returned to Athens and founded the school called the Lyceum, where he remained until a year before his death.

Aristotle studied under Plato but rejected much of his teacher's views. In particular, he rejected Plato's Doctrine of Forms, the view that abstract universal things (such as whiteness) exist independently of particular physical things (such as white objects). The differences between Aristotle and Plato on these basic conceptual and metaphysical issues shaped nearly all subsequent Western philosophical thought.

Aristotle's influence on Western science and philosophy are unparalleled. His writings spanned science, theology, logic, ethics, politics, art, and other topics. His thought was systematic and had several basic and unifying themes, particularly the notion of teleology, or goal-directedness. He held the view that the natural world can be understood only in terms of change, in which change was always movement from some potential toward some actualization or fulfillment of a naturally determined goal, such as an acorn moving from its potential state of being an oak tree toward the actualization of that goal.

This teleological category also informed Aristotle's social, political, and ethical views. The nature of the good life and the good State were seen by him as being a function of the kinds of entities that were involved with moral behavior, whether at the individual or collective level. Being a good person or being a good citizen were matters of both intellectual virtues and practical virtues, both related to the goal-directed natures

Marble portrait bust of Aristotle. Roman copy of a Greek original in the style of Lysippos, fourth century BCE. (Jupiterimages)

of human action. In particular, his moral virtues incorporated what came to be known as the Doctrine of the Mean, which advocated a middle ground or moderation between the extremes of excess and deficit. With respect to his view of the nature of the State, he claimed that humans are by nature political (i.e., social) beings, so the State is a natural aspect of human life, contrary to the later conception of Social Contract Theory, which saw the State only as the result of consensus among an aggregation of individuals.

The best State, he argued, was a middle ground between rule by too few (such as tyranny) and rule by too many (such as democracy). Preferential to those extremes is a polity, or republic.

Although Aristotle's scientific influence was significant for almost two millennia, his social and philosophical influence waned quickly in the West after his death in large part because his writings were lost to Western scholars. With the rediscovery and translation of his works in the 1100s and 1200s, however, his influence eclipsed every other classical thinker during the late Middle Ages, so much so that he was known as "The Philosopher." He became the foil for much of the scholarly focus during the sixteenth and seventeenth centuries with the emergence of the Cartesian and Newtonian worldviews.

Hellenistic and Roman Philosophy

Although the four basic schools of ancient Greek philosophy were established during the mushrooming development of many philosophic stances and sects in Athens before 300 BCE (Academic ca. 385, Peripatetic 335, Epicurean 306, and Stoic 301), the development and influence of the last two only came after 300 in the Hellenistic period and for a time (200 BCE–100 CE) far outshone the popularity of the first two. However, after 100 CE Stoicism and Epicureanism faded, while the former two, especially Platonism, had a strong resurgence even though there was no institutional continuity after the time of the late Roman republic.

The Academy went through violent metamorphoses from strong dogmatism at the start of the Hellenistic period to strong skepticism from 270 BCE for 150 years with Arcesilaus (scholarch: 268–241) and Carneades (scholarch: 155–137). The later Academy under Antiochus and his successors returned to a modified dogmatism. Aristotle's school, the Lyceum, was very active in the early Hellenistic period, setting up the Alexandrian Museum and Library through its member Demetrius of Phalerum (ca. 350–284) and also in fueling the development of

PHILOSOPHERS' THOUGHTS ON PHILOSOPHY

"The greatest authors, and the greatest number of authors, have maintained that there are three divisions of philosophy—moral, natural, and rational. The first keeps the soul in order; the second investigates the universe; the third works out the essential meanings of words, their combinations, and the proofs which keep falsehood from creeping in and displacing truth."

scholarship and science, especially notable in the personage of Eratosthenes (ca. 276–195), who became the chief Librarian at Alexandria, was a friend of Archimedes, and was the most widely engaged scholar-poet of his time, even participating on both sides of the great Hellenistic philosophic struggle between dogmatists and skeptics (as a skeptic with Stoic psychology). The Stoics set up a competitive library complex at Pergamum and fostered the development of literary criticism and grammar. The Middle Stoa were also very active philosophically: Posidonius (ca. 135–50) revised some basic doctrines, and Panaetius (ca. 185–109) made Stoicism pro-Roman. Greek philosophies in general were popular among the late republican rulers, especially through the advocacy of Cicero (106–43). The Epicureans kept to themselves until they took root in Campania near Naples and came to have a great influence on Roman thought and literature in the first centuries BCE and CE (e.g., Lucretius ca. 94–50). Throughout this period and the next, Cynics wandered the Greek world with their poverty, street-corner sermons, and doctrine of the brotherhood of all men.

The first centuries BCE and CE was the heyday of the Stoicism, both as the bulwark of imperialism in Seneca (5 BCE–65 CE) and Marcus Aurelius (121–180) and as the opponent of imperialism in Cicero, Musonius Rufus (ca. 30–100), and Epictetus (ca. 50–138). It was in the second century BCE that two separate trends arose. First, the shadow sect of skepticism rose to prominence as a separate school (Sextus Empiricus ca. 200) and as a popular point of view (Lucian 115–180). Second, the philosophical compass began

to veer away from materialism and back to idealism as the Neo-Pythagoreanism of the late republic and early empire blossomed and combined with a renascent Platonism seen in Plutarch (46–120) and Albinus (ca. 100–155) to become Middle Platonism, which through a reignited interest in Aristotle (e.g., commentaries such as those of Alexander Aphrodisias flourished around 175), and developments in Alexandria became a springboard for Neoplatonism.

Alexandria had become a major seat of philosophy as the Roman empire grew and became particularly important from the second century CE as the seedbed for Neoplatonism and Christian theology in the person of Ammonius Saccas (ca. 165–242), who taught the Christian Origen and philosopher Plotinus (205–270), who immigrated to Rome to found his school. The latter was the most powerful thinker since 300 BCE. Although he claimed only to be interpreting Plato, he in fact was the founder of Neoplatonism, the most influential school of thought to come out of antiquity. With the dual rise of Neoplatonism and Christianity the dominance of materialism was broken, and philosophy returned to its stance of the fourth century BCE.

■ Introduction: Judaism and Zoroastrianism—Iron Age Traditions

At the beginning of the Iron Age (1200 BCE), monotheism (the belief in only one god) was rare and may not have existed at all. By 300 CE, monotheism was one of the dominant theological concepts in the Roman empire and the Sassanid empire of Iran. Mono-

theism developed in two distinct religious traditions, Judaism and Zoroastrianism, both traditions that developed under Persian authority.

The roots of Judaism lie well before the history of the Persians, in the traditions of the Hebrew Bible/Old Testament. It was in the kingdoms

of Judah and Israel that monotheistic belief systems seems to have emerged. The religions of Judah and Israel do not seem to have been monotheistic initially. Note that the commandment that “you shall have no other gods before me” does not argue that there are no other gods; it just commands the Israelites to worship only the one God. Much of the Bible preserves a theological argument for monotheism. The story of God’s wrath at the Israelites’ manufacture of a golden calf for worship when Moses was receiving the Ten Commandments on Mount Sinai reflects this argument. By the end of the Iron Age, when the people of Judah were exiled to Babylon (and the First Temple in Jerusalem was destroyed), monotheism seems to have become a fundamental part of the religious perspective, and in Babylon the religion of Judaism seems to have developed.

The religion of Judaism was profoundly influenced by the experiences of the exiles in Babylon (as described in some of the later books of the Hebrew Bible/Old Testament). The Persians conquered Babylon (in 532 BCE) and allowed the Judeans to return to Israel. Persian imperial attitudes toward foreign religion were tolerant, and under Persian authority Judaism was able to thrive.

The Persian court was heavily influenced by the priests of another tradition, Zoroastrianism. It is unclear to what extent the Persian kings themselves could be considered Zoroastrians, but certainly this religious tradition was an important one at court. The beliefs of Zoroastrians are complex and varied but at its heart lies a belief in one universal god, Ahura Mazda, who has both masculine and feminine elements. Because of this and the belief in lesser spirits, it is often argued that Zoroastrianism is better considered dualistic. It is a tradition that incorporates (and has influenced) elements from both Western and Eastern religious traditions. Unfortunately, little is known with certainty about its early formation, but it can be said that it continued and developed after the collapse of the Persian empire.

Judaism similarly continued and developed after the collapse of Persian authority, and eventually the lands where the tradition was practiced were incorporated into the Roman empire. Jewish religious life was centered on the Second Temple in Jerusalem until 70 CE, when the Temple was destroyed by the Romans in response to

a Jewish revolt. Lacking a central temple, Jewish practices came to be centered on the synagogue, and Rabbinical Judaism emerged.

—Kevin M. McGeough

Judaism and Ancient Israel

It is widely known that Judaism has its origins in the religion of ancient Israel, but these two belief systems are by no means identical. Both, of course, venerated the deity YHWH (probably pronounced “Yahweh” and often rendered as “LORD” in English translations), but later Judaism developed a number of doctrines, such as a belief in a resurrection of the dead, that would have been alien to the ancient Israelites. Conversely, the rabbis of the first century CE would have been horrified by the polytheism and idolatry practiced by the Israelites and Judeans of the monarchic period.

The central credo of Judaism emphasizes the belief in only one god. There is a great deal of evidence, however, that suggests that the religion actually practiced in the ancient kingdom did not approach true monotheism before perhaps the end of the eighth century BCE. The Bible itself continually mentions the fact that the people went “astray” and worshipped Canaanite deities such as Baal and Ashtaroath (cf. Judges 2:13 and 10:6; 1 Samuel 12:10); less clear, however, is whether this worship was viewed as sinful by the state and religious authorities of the time. During the period of the Judges, for example, the hero Gideon is said also to have the name “Jerubbaal”; the etymology given in Judges 6:32 is “Let Baal contend against him,” with the implication being that Gideon was a zealous opponent of Baal worship. As scholars have noted, however, this etymology is less likely than one that reads the name as honoring the deity mentioned (such as “founded of Baal”; cf. e.g., “Jeruel” in 2 Chronicles 20:16). Some scholars have suggested that the tale of his “hewing down” (which, conveniently, is what the name “Gideon” means) his father’s altar to Baal may have been designed to “sanitize” his story for the later Yahwist audience.

The names of some of Saul’s descendants provide more evidence that even among the ruling classes, the religion of ancient Israel was not monotheistic. According to 1 Chronicles 8:33,

for example, Saul named one of his sons Esh-Baal (“man of Baal”), indicating that Saul’s opinion of this Canaanite deity was not unfavorable; this name apparently bothered the authors of 1 Samuel enough that they provided a euphemism for it, “Ish-bosheth” (lit. “man of shame”; cf. 2 Samuel 2:8). And while the biblical record presents Saul’s successor David as a faithful Yahwist, he appears to have been less than successful in instilling such fidelity in his son; according to 1 Kings 11:1–8, Solomon was “led astray” by his foreign wives late in his life and began to worship other gods. Thus, even during the golden age of Israel’s united monarchy, there are a number of clues that even the official religion was not the monotheism that would be so central to later Judaism.

After Solomon’s reign, the monarchy split in two: Jeroboam became king of the northern kingdom (Israel), while Solomon’s son Rehoboam reigned in the south (Judah). From this point onward, the religion of Israel proper (i.e., the northern kingdom) was characterized by apostasy from, or even outright opposition to, YHWH. Ahab, perhaps Israel’s most infamous king, built a temple to Baal and set up female fertility totems (*Asherah*); his wife, the Phoenician princess Jezebel, went so far as to order the deaths of Yahwist prophets. The remaining history of the northern kingdom, down to the fall of its capital Samaria in 721 BCE, was marked by one religious misdeed after another (at least from the perspective of the biblical authors), with each king’s reign summarized by the formula “and he did evil in the sight of the LORD.”

Only at the end of the eighth century BCE, after the fall of Israel, do we see biblical religion moving toward the strict universal monotheism that it would ultimately develop into. Even the religion of the Judean monarchy, however, still showed significant differences from later Judaism. In the seventh century BCE, for example, King Manasseh is said to have “erected altars for Baal and made an Asherah, as Ahab king of Israel had done, and worshiped all the host of heaven and served them” (2 Kings 21:3, NASB). It is interesting to note that there is no mention of the people rebelling against Manasseh for this heresy; indeed, his 55-year reign was longer than that of any other king of Israel or Judah. Nevertheless, from the perspective of the biblical authors, Manasseh’s infractions were so severe that

➤ ZOROASTRIANISM’S INFLUENCE ON JUDAISM

Some of the doctrines of Judaism that are not found in ancient Israelite religion may reflect the influence of Persian and Hellenistic culture. For example, the texts of Zoroastrianism, a religion practiced in ancient Persia (which ruled over the Judeans during 539–332 BCE), contain passages about a resurrection of the dead and a “Last Judgment,” such as the following:

“In fifty-seven years the Soshyant (“Savior”) will raise up all the dead. And all mankind will arise, whether just or wicked. . . . Then the assembly of Isadvastar will take place. In that assembly, everyone will behold his own good or bad deeds, and the just will stand out among the wicked like white sheep among the black.”

—John Walton Burnight

the LORD would ultimately destroy the nation for it by bringing the Babylonian Army to destroy the Temple and exile the populace in 586 BCE (cf. 2 Kings 24:3–4), thus ending the Davidic monarchy.

By the first century CE after centuries of Babylonian, Persian, Hellenistic, and finally Roman rule, Yahwism had changed significantly from what it had been during the period of the monarchy. Baal worship was a distant memory, and idolatry was anathema to both the common people and the elite. Despite or perhaps because of the fact that they had been subject to foreign rule for most of the preceding half millennium, their belief in the unique status and omnipotence of their God grew ever stronger, as did their categorical rejection of idols. This, of course, led to considerable friction with their pagan Roman rulers, who required their other subject peoples to worship Caesar. After a series of rebellions, the Romans destroyed the Jerusalem Temple in 70 CE. It is a testimony to the strength of Jewish faith that the various conquests, exiles, and persecutions did not put an end to Yahwism. In fact, while the religions of the various empires

that conquered them fell by the wayside, the religion of the ancient Israelites, while changing significantly, continued to grow, providing the seeds not just for modern Judaism but also for Christianity and Islam as well.

Rabbinical Judaism

Rabbinical Judaism is the form of Judean religion that became normative after the destruction of the Jerusalem Temple by the Romans in 70 CE. For centuries, this temple had been the focal point of Judaism, and its destruction—prompted by a Jewish revolt that lasted from 66 to 74 CE—presented a threat to the future of the religion. The power of the elite Sadducees (descendants of the Zadokite priests, from whom they took

their name) was largely tied to temple ritual, and so their role in Jewish life was greatly diminished. The influence of the rival sect of the Pharisees, on the other hand, was less centralized and focused more on synagogues and so was better able to meet the needs of a diaspora community that had lost its central shrine. In addition, the Pharisee leaders Hillel and Shammai had established rabbinic academies earlier in the first century; these became new focal points for the religion.

Also in 70 CE, a rabbinic council was formed at the coastal city of Yavneh under the leadership of the Hillelite rabbi Yohanan ben Zakkai. During the following decades this council would go a long way toward shaping the future of Judaism, with its (now necessary) emphasis on individual piety and the study of sacred writings rather than on temple ritual. Importantly, a decision was made to allow sacrifices—which could only be done at the temple—to be replaced with monetary offerings. In addition, the rules for holidays were modified to allow their observance away from Jerusalem. The shape of the Hebrew Bible also neared its final form (although some books, such as Ecclesiastes, were still debated for some time). It would ultimately consist of three major divisions: the Torah (“instruction, law”), the Neviim (“prophets”), and the Kethuvim (“writings”). Collectively, the works were called by the acronym Tanakh, made up of the first letter of each division; the contents are the equivalent of the Christian Old Testament, although the order and groupings are different.

Yohanan’s successor, Rabban Gamaliel II (a great-grandson of Hillel), was recognized by both the Jewish community and the Romans as a leader of the Jews in Palestine, thus ensuring the survival of the Pharisees’ vision of Judaism. The ability to worship apart from Jerusalem became particularly important following a second Jewish uprising in 132–135, led by a Jewish nationalist named Simeon Bar Kokhba. After suppressing the Bar Kokhba Revolt, the Roman emperor Hadrian banned Jews from their former capital; he proclaimed it a pagan city and renamed it Aelia Capitolina. The Yavneh academy subsequently moved to the northern region of Galilee, which would replace Jerusalem as the center of Jewish life in Palestine for the next 800 years. It was here that the rabbi Judah ha-Nasi (Judah the

➤ EXCERPT FROM “BENEDICTIONS,” THE FIRST TRACTATE OF THE *MISHNAH*

“1.2 From what time in the morning may the *Shema** be recited? So soon as one can distinguish between blue and white. Rabbi Eliezer says: Between blue and green. And it should be finished before sunrise. Rabbi Joshua says: Before the third hour: for so is it the way of kings, to rise up at the third hour. He that recites it from that time onward suffers no loss and is like to one that reads in the law.”

—John Walton Burnight

*Deut. 6:4, a central prayer that states the basic tenets of Judaism.

Adapted from Herbert Danby (Trans.). *The Mishnah*. Oxford: Oxford University Press, 1933, 2.

Patriarch, ca. 175–220 CE) was instrumental in the compilation of the Mishnah. The Mishnah (lit. “repetition,” also called the Oral Torah) is a set of laws and debates that according to tradition originated with Moses and were passed down orally for centuries until they were finally written down in the second century CE by rabbis called *tannaim*. The Mishnah, however, seems to reflect the perspectives and concerns of Jews of the posttemple period, and its laws are often framed as legal discussions between the House of Hillel and the House of Shammai (which, as noted above, were founded in the first century CE). It consists of 63 tractates in six divisions: *Zera'im* (Seeds), *Mo'ed* (Festivals), *Nashim* (Women), *Nezikin* (Damages), *Kodashim* (Holy Things), and *Tohorot* (Purifications). As the names of the tractates imply, the Mishnah's principal concerns are ritual and purity; it contains little in the way of formal theology or history. Interestingly, despite its largely legal content, there are a number of instances in which multiple opinions on a question are presented, with no clear instruction as to which one is to be viewed as correct.

The Mishnah is considered to be the last revelation in Judaism, and all subsequent rabbinic work is viewed as commentary on either it or the Tanakh. That applied to the Tanakh is traditionally divided into four types, collectively called by the acronym *Pardes*: (1) *pesbat*, the plain or literal interpretation; (2) *remez*, hints or implied interpretation; (3) *derash*, inquiry, homiletic or comparative interpretation (also called *midrash*); and (4) *sod*, mystical interpretation. The third of these, *midrash*, is further divided into two subtypes: *halakha*, legal and ritual applications, and *aggadah*, tales and folklore designed to provide moral and practical advice. *Midrashim* (plural of *midrash*) often contain pious expansions of biblical stories.

Rabbinic commentary applied to the Mishnah is grouped under the broad heading *Gemara* (Finishing). The Jerusalem Talmud is the Mishnah combined with a *Gemara* crafted by the scholars of the rabbinic center in Jerusalem; it was completed by about 400 CE. Rabbis in the Babylonian Diaspora later applied their own *Gemara* to the Mishnah, and this became the Babylonian Talmud (finished by approximately 600 CE). These two Talmudim, along with the Hebrew Bible and the various rabbinic *midrashim*

applied to it, became the foundational documents for modern Judaism.

Zoroastrianism (through the Parthian Period)

Zoroastrianism was the main religion of pre-Islamic Iran adopted by Iranian peoples across the ancient Near East and central Asia. The name “Zoroaster” is the Greek rendition of the name of the religion's prophet and founder, Spitama

➤ ZOROASTRIAN DUALISM AND APOCALYPSE

Zoroastrian cosmology was extremely dualistic, with an Evil Spirit (Av. Angra Mainyu) opposing the Wise Lord. Where exactly evil came from was the object of much speculation, with many different variations within the religion. We learn from later texts that Ahura Mazda created the physical world to trap and ultimately destroy Angra Mainyu. Creation was thus a battlefield between good and evil, and while all good in the world was a product of Ahura Mazda's original creation, everything evil resulted from Angra Mainyu's perversion and pollution of it. Destroying anything that was the Evil Spirit's handiwork, including insects and reptiles, was a duty of a good Zoroastrian and was thought to hasten the ultimate purification of the world. The world would be purified with Angra Mainyu and all his distortions annihilated at a final apocalyptic battle at the end of time. At this point there would be a resurrection of the dead, last judgment, and punishment in rivers of molten metal for evildoers. The political utility of this dualism was not lost on Iranian kings. In his inscriptions Darius I (ca. 550–486 BCE) casts any opposition as the creation of the Lie.

—Matthew Canepa

Zarathushtra. The religion was known to its adherents as Mazdayasnian (Mazda worshipping) or simply the Good Religion. The era of Zarathushtra's life remains a focus of scholarly debate and due to the fragmentary nature of all evidence involved is a story that will likely never be conclusively detailed. Dates proposed by scholars and various ancient sources range widely, from 6,000 years before Plato to 248 years before Alexander. The eras that have received the strongest advocacy are circa 1000 BCE and 541 BCE.

Zoroastrianism was a prophetic revision of ancient Iranian religion and contains many elements common to it and to ancient Indo-Iranian religion. The collection of the sacred texts of Zoroastrianism is known as the Avesta, and the language in which the texts are written is called Avestan. It is the closest surviving language to Vedic Sanskrit with which it shares a similar grammar, metric structure, and even some of the same vocabulary, including names of gods. The Avestan and Vedic language stems from a time when the two branches of the Indo-Iranian, or Aryan, group of Indo-Europeans were still one people. Calling themselves noble (Avestan, *Airīia*; Vedic, *Arya*), this culture practiced a religion based on veneration of fire and the preparation of an intoxicating substance (Avestan, *Haoma*; Vedic, *Soma*), and was the progenitor of the peoples who migrated into Iran and India, respectively. At some point after these groups split and their cultures diverged, the gods (Vedic, *deva*) of one

became the demons of the other (Avestan, *daeua*, related to the English “devil,” or “little god”).

Zarathushtra introduced a reform into the ancient Iranian religion based on the rejection of all old gods and the worship of a single Great God, whom he called Ahura Mazda (Wise Lord). Fundamental to Zoroastrianism then and now is the practice of good thoughts, good words, and good deeds; abhorrence of any falsehood; and respect for fire, earth, and water, all the Wise Lord's good creations. After Zarathushtra's death, many elements of the old Iranian tradition were reincorporated into the new religion. Some of the old gods, such as the warrior gods Mithra (god of pacts and their enforcement) and Verethragna (lit. “smashing of obstacles”), as well the preparation of Haoma and veneration of fire now served and protected the religion. The major surviving parts of the Avesta consist of Zarathushtra's Gathas (Hymns), which is the most ancient portion; liturgical prayers; a later group of hymns to various deities, most of whom had roots in the pre-Zoroastrian religion; and laws.

Many Iranian peoples continued to practice variations of the pre-Zoroastrian religion, with Zoroastrianism orthodoxy only emerging much later under the Sassanian dynasty of Iran (226–651 CE). Scholars do not agree if the Achaemenid Persians (558–330 BCE) were Zoroastrian. Yet while the Achaemenids never mention Zarathushtra, their monumental inscriptions praise Ahura Mazda and proclaim hatred for “the Lie,” while their personal inscriptions mention the preparation of Haoma, and monumental art indicates a veneration of fire. Iranian religion in general was thrown into great disarray after Alexander's invasions (334–330 BCE), which resulted in the loss of much of the Avesta. Yet while there is great evidence of ritual and artistic fusion with Hellenistic culture during this period, the Zoroastrian religion remained intact, likely with the active support of the Arsacid (Parthian) dynasty. Zoroastrian ideas, such as an apocalypse, resurrection of the body, and last judgment, influenced Christianity through Judaism. None of these ideas were present in Judaism until after the Persian king of kings Cyrus, a prophet and anointed of God according to the Bible, granted the Jews freedom from their Babylonian captivity.

Dualistic Traditions in Persia: Manicheanism and Mandaeanism

Persia during the period between 1000 BCE to 300 CE was a mosaic of different cultural traditions, influenced by Hellenistic-Mediterranean culture, Near Eastern culture, and South Asian culture. Within this mosaic, there was a significant amount of religious freedom (although that varied depending on the leadership). Under the Parthian and Sassanid dynasties, dualistic traditions merged elements of Zoroastrianism with Christian and Gnostic teachings. Two of these, Manicheanism and Mandaeanism, spread beyond the boundaries of Persia and can be considered world religions.

The teachings of the prophet Mani (ca. 216–276 CE) form the basis of Manicheanism. Mani was a Mesopotamian religious prophet who wandered throughout Persia beginning shortly after the establishment of the Sassanid dynasty. He preached an extreme form of dualism in which the world is understood as divided into the Forces of Light (the Kingdom of God) and the Forces of Darkness (the Kingdom of Satan). Although his original writings have been lost, remnants are preserved in later Manichean documents. Mani claims to have been an apostle of Jesus Christ, who (according to later biographies) received a revelation about the true nature of the universe when he was in his twenties. Manicheanism became very popular among elites in the Sassanid court. His teachings spread outside of Persia through his missionary activities that took him to Egypt, Syria-Palestine, India, and central Asia. No doubt these early movements led to the spread of Manicheanism as far east as China in later periods. At the end

THE BOOK OF GIANTS

Also known as *Ohya the Giant*, the *Book of Giants* is an apocryphal biblical text that has been found at Qumran (among the Dead Sea Scrolls) and at Turpan in the Tarim basin in China. The Dead Sea Scrolls version of the text dates to earlier than the second century BCE, but its presence in China suggests that this book was important to the Manichaean community that lived there. The text presents stories of antediluvian giants, one of which is named Ohya (or Ogias). The only versions of this text that have been recovered have been fragmentary. Thus, scholars debate the order of the narrative events of the story, and interpretations of it are debatable.

—Kevin M. McGeough

of his days, Mani had fallen out of favor with the Sassanid court, and tradition holds that he died or was martyred in prison.

Manicheanism was a form of Christianity that blended elements of Judaism and Gnosticism with Zoroastrianism. As in Gnosticism, Manicheanism does not hold God to be omnipotent but rather on equal footing with Satan. Some have argued that there are Buddhist and Hindu elements in Manicheanism, which were incorporated during Mani's travels to India. In particular, Foltz has argued that the concept of the transmigration of the soul was derived from Buddhism and that the structure of the Buddhist *sangha* was the basis of the organization of the Manichean community. Manicheanism was well suited for this kind of hybridization of religious beliefs since one of its fundamental tenets was that it revealed more complete teachings that had not yet been revealed in other traditions. Thus, as it spread, it incorporated ideas from various local traditions.

Within Persia, Manicheanism was not as popular as another nearly contemporary tradition: Mandaeanism (which was especially favored under the Parthians). Like Manicheanism, Mandaeanism was informed by Gnosticism and Zoroastrianism. Mandaean dualism sees a cosmic father and mother who are also associated with light and dark and other binaries, although

there is no systematic theology or cosmology within the diverse community of believers. However, most Mandeans trace the origins of their beliefs to Adam (the first man in the Judeo-Christian tradition) and see John the Baptist as one of the most important prophets (as opposed to Jesus, who is not held in as high regard by the tradition). Little of the secular history of Mandaeanism is preserved in their own accounts, as the history of the physical world was of little interest to the community.

■ Introduction: Christianity

Christianity owes its existence to the conviction of a small Palestinian Jewish community that their crucified leader, Jesus of Nazareth (ca. 4 BCE–30 CE), had been resurrected from the dead by the God of Israel. An itinerant rabbi, healer, and nonviolent social revolutionary, Jesus heralded the advent of the Kingdom of God, a new “Way” of being in which God is the king over all earthly affairs. But contrary to kingship through exertion of brute force—the method both practiced by Rome and widely anticipated by first-century Jews as indispensable to Messiah’s Roman conquest—Jesus proclaimed that God reigns by internally transforming the lives of individuals through unconditional love. Claiming to speak and act with divine authority, Jesus was perceived as a threat by Jewish and Roman authorities alike and thus suffered crucifixion under the sentence of Roman procurator Pontius Pilate (r. 26–36 CE).

Shortly thereafter, among the apostles (Jesus’s designated leaders) and disciples emerged belief in Jesus’s resurrection alongside the corollary that God had thereby vindicated Jesus’s messiahship and deity. Hence, a new faith was born in Jerusalem that under the apostles’ leadership extended northward to Antioch and southward to Alexandria. Notwithstanding this Near Eastern growth, the person chiefly responsible for the development of Christianity into a world religion was the Hellenistic Jewish thinker

Paul (ca. 10–64 CE), a protégé of leading Pharisaic rabbi Gamaliel and former persecutor of the followers of Jesus. Following a vision in which he encountered the risen Christ, Paul became Jesus’s greatest interpreter and evangelist. From Jesus’s ministry Paul extrapolated the doctrines of justification by grace through faith, the atonement, and the ultimate fulfillment of ceremonial Jewish law in the crucifixion. Accordingly, Gentiles could join the Jesus movement without observing Jewish customs, a point emphasized by Paul on three successful missionary journeys throughout the Mediterranean basin.

Presenting itself as an alternative way of understanding the Gospel, Gnosticism assimilated the figure of Jesus into its syncretistic blend of Greek, Jewish, and Asian philosophic tendencies. To compete with the prevalent Pauline Christianity, in the second and third centuries Gnostics authored pseudonymous gospels that differentiated the utterly transcendent supreme God from the Hebrew biblical Yahweh, portrayed as a wicked demiurge. Gnostics viewed Jesus as a God-inspired teacher of secret knowledge (*gnosis*) that humans must apprehend in order for their intrinsically good souls to escape from their imprisoning evil bodies.

Gnostic positions were sharply rejected by ante-Nicene Church Fathers, the theologians reputed for spiritual leadership and often martyrdom in an era when Christianity was illegal in

the Roman empire. In their exegetical treatises the Fathers distinguished between orthodoxy and heresy by employing the criterion of apostolicity, which defined true beliefs as those conforming to the life, teaching, and experience of the apostles. On this basis a collection of documents, including the four Gospels and the letters of Paul, gained recognition as canonical, and concepts regarded as logical derivations from these scriptures, such as the Trinity, assumed their earliest shape.

Life of Christ

Jesus of Nazareth (ca. 4 BCE–ca. 30 CE) was an itinerant Jewish preacher in and around Galilee who gathered a following principally among his fellow Jews and who was executed near Jerusalem by the Roman government under a charge of political sedition. Since Jesus did not leave behind any writings, virtually everything we know about his life comes from those who believed that he was the long-awaited Jewish Messiah. This was a Hebrew term meaning the “anointed one” who would restore the glory of David’s kingdom and inaugurate a new era of God’s dealings with humanity. In Greek the term for “anointed one” is “Christ.” Whether Jesus claimed this title for Himself during His lifetime is debated by scholars. The principal sources for His life are a series of surviving gospels (“good news”) written by Christians from around 60 CE to around 120 CE. Four of these accounts are contained within the New Testament, while numerous others were included in the Christian canon. Modern scholars have

RESURRECTION

“Then one [of the disciples], whose name was Cleopas, answered [the stranger, who unbeknownst to them, was actually the risen Jesus], ‘Are you the only stranger in Jerusalem who does not know the things that have taken place there in these days? . . . The things about Jesus of Nazareth, who was a prophet mighty in deed and word before God and all the people, and how our chief priests and leaders handed him over to be condemned to death and crucified him. But we had hoped that he was the one to redeem Israel.’ . . . Then [Jesus] said to them, ‘Oh how foolish you are, and how slow of heart to believe all that the prophets have declared! Was it not necessary that the Messiah should suffer these things and then enter into his glory?’ Then beginning with Moses and all the prophets, he interpreted to them the things about himself in all the scriptures” (Luke 24:18–21, 25–27).

—Jeffrey Trumbower

thus had to piece together details of Jesus’s life, accounting for the discrepancies among the gospels and the agendas of their various authors.

Two gospels (Matthew and Luke) claim that Jesus was born in Bethlehem, although they differ on the details of why His family was there. This Bethlehem connection could have been the result of a later legend that tied Jesus to this so-called City of David, especially since He was known in His adult life as Jesus of Nazareth, not Jesus of Bethlehem. Nothing is known of Jesus’s activities until He was about age 30, at which time all the sources claim that He was associated with an ascetic Jewish apocalyptic preacher named John the Baptist. After His encounter with John, Jesus embarked on His own career of preaching, healing, and casting out demons throughout Galilee, attracting both admirers and opponents among the Jewish populace. His preaching seems to have focused on the dawning Kingdom of God, variously understood in the sources. It appears that Jesus preached an ethic of love for God and neighbor tied to a view that God was now including in His Kingdom

some, such as tax collectors and certain repentant sinners, whom others might exclude. In some year during the reign of the Roman governor Pontius Pilate, who ruled Judea during 26–36 CE, Jesus decided to go to Jerusalem during the politically charged spring Passover festival, where He may have engaged in provocative actions (Mark 11). It is possible that He and/or His followers were expecting dramatic, universally visible intervention by God to correct the injustices of foreign occupation, based on earlier prophecies in the Hebrew Bible and other pre-Christian Jewish sources (see Zechariah 9 and 14 and Luke 24:18–21). Instead, what they received was a crucified Messiah, as Jesus was arrested and put to death through a collaboration of Jewish and Roman authorities. At this point, Jesus's followers had to choose to either abandon the movement or to reinterpret Jesus in light of the new facts of His death and apparent outward failure. Many of these followers became convinced that God had raised Jesus from the dead and had then taken Him up into heaven, vindicating His life and message. This set the stage for the spread of the initially Jewish and eventually multiethnic religion that would become known as Christianity. Christians hold that the life of Christ, far from ending in 30 CE, continues on and that Jesus will return from heaven some day to judge the living and the dead.

Apostles and the Early Spread of Christianity

After the death of Jesus there were two distinct factions of His followers in Jerusalem—the Aramaic-speaking Christian Jews and the Hellenized, Greek-speaking Christian Jews. The Aramaic-speaking Christian Jews were confined largely to Jerusalem; they were conservative, le-

galistic, and exclusive, still practicing Jews in all ways except that they believed that Jesus was the Messiah. They did not seek wider missionary activity but worshipped in the Temple and in each other's houses. The Greek-speaking Hellenized Christian Jews considered themselves part of the intellectual and cultural environment of the larger Greco-Roman world. They met in the synagogues throughout Jerusalem and they read the Septuagint, the Greek version of the Hebrew scriptures.

Paul, the Greek-speaking Pharisee who later became a Christian missionary to the Dispersion Jews and to the Gentiles (from the Latin *gens*, “people,” which to the Jews meant anyone who was not a Jew), initially harassed those early Hellenized Christian Jews. He zealously persecuted uncircumcised converts, and he was present at the stoning in 35 CE of the proto-martyr Stephen, a Hellenized Christian Jew who claimed that Jesus was the prophet of Moses. After a dramatic conversion on the road to Damascus in 37 CE (Acts 9:1–19), however, Paul traveled through the cities of Syria, Asia Minor, and Greece to preach the message of Jesus to Jews and Gentiles. It was just after the early Christian churches had been established there in 40 CE that Paul and his followers at Antioch were first called *Christianoi*, “men of Christ.”

By 40 CE, the Christian movement had expanded and not only did these two distinct groups of Christian Jews disagree on several practical and theological issues but the Jews more generally were at odds with the Romans. The Hellenized Christian Jews following Paul did not think that conversion should require the traditional Jewish practices of circumcision, the observance of the Sabbath, and dietary laws. According to Acts 15, this argument about circumcision between Paul and the Aramaic-speaking Christian Jews was settled in 50 CE at the Apostolic Council in Jerusalem. Gentiles who converted to Christian Judaism no longer had to be circumcised. In a short time and largely through the missionary work of Paul and his followers, Christianity became a separate form of Judaism. Morality and ethical conduct, if not circumcision, still bound Jews and converts alike to the Torah. But the central shared Christian rite of the Eucharist (from the Greek *eucharistia*, “thanksgiving”), “communion,” which

represented Jesus's death, was now the only sacrifice necessary in their worship of God.

Despite the decision of the Apostolic Council to allow uncircumcised Gentiles to become Christians, Paul's proselytizing continued to offend some Jews in the synagogues where he preached. He had replaced the Torah with faith in Jesus whom his followers now called the Christ. Many Jews felt that if Paul was right then Moses and the Scriptures were wrong and so they were hostile to his teaching. Herod Agrippa I, who ruled in Jerusalem from 41–44 CE, persecuted Christians in an effort to appease the traditional Jews who were not followers of Jesus and who were suffering under the increasing hostility and religious intolerance of local Roman governors. Often when Paul preached, local Jews rioted and stoned him, to force him to leave their synagogues and their cities. Both at Philippi in Greece and in Judea, Roman officials had to step in when the rioting became too serious. In Judea, fellow Christians feared for Paul's life and he was spirited away and brought before the Roman governor in Caesarea. There he was kept under house arrest for over two years. At that time he appealed his case to the emperor, a privilege reserved for Roman citizens, rather than stand trial against his accusers in Jerusalem.

In 58 CE, just before leaving Caesarea to go to Rome, Paul had an audience with Agrippa II, king of the Jews, and his sister Berenice, at which Agrippa is reputed to have interrupted Paul's discourse to concede that he would soon make a Christian of him if he kept up his preaching. En route to Rome, where his case had been transferred, Paul was shipwrecked on Malta. Upon arriving in Rome, he was under house arrest but seems to have continued preaching until at least 64 CE. This was the period of the great fire in Rome under Nero for which Christians have sometimes been blamed; Paul is traditionally considered to have been martyred then along with other Christians charged with starting the fire.

CHRISTIANITY AND THE DESTRUCTION OF THE SECOND TEMPLE

The impact of Paul's organized ministries in synagogues throughout the Diaspora was strengthened by the destruction of the Jewish Temple in 70 CE, under the Flavian emperors Vespasian and his son Titus. This war is considered by many to be the clear break between Judaism and Christianity: while the destruction of the Temple profoundly altered the nature of Judaism, Paul's message that salvation was possible without the law simultaneously hastened Christianity's transformation from a reform movement within Judaism into an *adversus Judaeos*, "against the Jews," religion. Christianity was a challenge to Judaism. For example, Christians conceived of Jesus as God and they believed that the prophecies of scripture were fulfilled in him, but this was something no Jew could accept; and although Jews and Christians both awaited the Messiah, the Christians considered Jesus the Messiah and expected his return. By the early second century, Ignatius, Bishop of Antioch, had written a series of letters while traveling to his martyrdom in Rome in which he drew a clear line of separation between Christians and Jews, claiming that it was monstrous to talk of Jesus Christ and to practice Judaism.

Pauline Christianity

Paul of Tarsus (ca. 10 CE–ca. 64 CE) was a Greek-speaking Pharisaic Jew who opposed the Jesus movement in the early 30s CE (Philippians 3:5–6) but who later became an influential Christian theologian. Although Paul never met the historical Jesus, he had a dramatic religious experience

Saint Paul was a first-century Christian convert credited with spreading Christianity throughout the Roman empire, St. Paul's Church, Rabat, Malta. (Corel Corporation)

of the risen Jesus (Galatians 1–2; Acts 9) that caused him to join the movement he had opposed. Paul led important missionary activities in Asia Minor and Greece in the 40s, 50s, and 60s CE that fostered the spread of Christianity. Thirteen letters in the New Testament are attributed to him, of which scholarly consensus considers at least seven to be genuine (1 Thessalonians, Philippians, 1 and 2 Corinthians, Galatians, Philemon, and Romans). Later tradition holds that he died a martyr at Rome during Nero's persecution of Christians in 64 CE. The author of the Gospel of Luke also wrote a biography of Paul (Acts 9–27) that both corroborates and contradicts details from his life that may be gleaned from the letters.

Pauline Christianity was focused on Jesus as the cosmic Christ whose death and resurrection constituted the focal point of the Jewish God's dealings with all humanity. There is very little in Paul's letters about Jesus's teachings. Paul's is a religion *about* Jesus rather than the religion *of* Jesus. Because of Jesus's death on the cross, the specific requirements of Jewish Law (Torah) are no longer necessary for either Jews or Gentiles (Galatians 2). Furthermore, because of Jesus's resurrection, all will soon be raised and transformed like He was (1 Corinthians 15). Believers in Jesus's death and resurrection put on Christ in a mystical sense and become new creatures, and this has concrete ethical implications (Romans 6–8). Paul anticipated Jesus's return from heaven within his own lifetime (1 Thessalonians 4:17),

➤ SCRIPTURE ON JESUS'S SACRIFICE

The following passage, taken from the letter of Paul to the Romans, demonstrates the essence and focus of Pauline Christianity: the cosmic effect of Jesus's death and resurrection on the relationship between God and humanity.

"There is therefore now no condemnation for those who are in Christ Jesus. For the law of the Spirit of life in Christ Jesus has set you free from the law of sin and death. For God has done what the law, weakened by the flesh, could not do: by sending his own Son in the likeness of sinful flesh,

and to deal with sin, he condemned sin in the flesh, so that the just requirement of the law might be fulfilled in us, who walk not according to the flesh but according to the spirit. . . . I consider that the sufferings of this present time are not worth comparing with the glory about to be revealed to us. For the creation waits with eager longing for the revealing of the children of God." (Romans 8:1–4, 18–19).

—Jeffrey Trumbower

at which time all demonic forces and powers opposed to God would be defeated (1 Corinthians 15:20–28). Paul's preaching could be radically egalitarian with respect to relations among believers (Galatians 3:28), but he could also be a social conservative, not wishing to spark social or political upheaval in the short time before Jesus's return (1 Corinthians 7–9; Romans 13).

The Gnostic Variations

A variety of Christian sects active during the first through fifth centuries CE are commonly designated as Gnostic. These groups interpreted the Hebrew Scriptures in light of the new confession of Christianity but with inspiration from Greco-Roman philosophy and Mystery religions. The result is a diverse array of theological systems adhering to no fixed dogma but departing drastically from the popular piety of the age.

In the Epistles of St. Paul, we find arguments being made against those who pretend to be recipients of secret knowledge (gnosis) unavailable to others. However, certain writings designated as Gnostic bear only a superficial relation to Christianity. A claim to secret knowledge and a consequent reversal of values are at the heart of the system of Simon Magus (described by his orthodox opponents, such as Irenaeus of Lyons, as the originator of all heresies), who elevated a prostitute to the status of universal Wisdom incarnate, and the sophisticated theology of Marcion, who taught that the God of the Hebrew Bible (Yahweh, Jehovah) was not really the Father of Jesus Christ but rather was an ignorant demigod extending his power by enslaving his human subjects by force of law, not love. This dichotomy (law versus love), drawn from the New Testament, led the seminal modern historian of dogma, Adolf von Harnack, to

➤ Gnostic Antiworldview

Scholars debate the term “Gnostic(ism),” but it is generally accepted that the various groups and texts so designated express a low opinion of life in this world and view certain humans (Gnostics) as citizens of a spiritual community that is temporarily held captive here yet destined for redemption through a cosmic process of salvation and restoration. Early Christian theologians and some pagan philosophers spent much time contesting the Gnostic worldview. The Gnostics themselves became prominent in many highly respected pagan philosophical circles of the early centuries CE as well as in Christian communities, where they sometimes held high office.

—Edward Moore

describe Marcion as the only early Christian, besides St. Paul, who truly understood the radical message of the Gospels. According to Marcion, Jesus was the emissary of a wholly alien God who, motivated by pure love, desired the release of humanity from its material imprisonment.

Around the same time, Basilides began to draw upon Stoic philosophy as he elaborated his system of a cosmic seed achieving fruition through the historical intervention of a divine savior-figure, Christ, and ending in the perfection of a cosmos reflecting divine glory. Basilides' near contemporary, Valentinus, elaborated a Christian philosophy of salvation in which souls were said to achieve redemption according to a hierarchical arrangement preordained by the highest God. The opponents of Valentinus quoted him as saying that certain souls are saved by nature, some through righteous acts, while others are destined for damnation. Valentinian Gnosticism is properly regarded as the first systematic expression of Christian theology, evident in the work of Ptolemy (Valentinus's pupil, not to be confused with the famous astronomer of that period) and the lengthy philosophical treatise *Tripartite Tractate* (in the Nag Hammadi Library of Coptic texts discovered in Egypt in 1945).

The joint founders of Neoplatonism, the Christian Origen of Alexandria and the pagan Plotinus, each opposed Gnosticism. Origen condemned the view that evil is a product of divinity;

Plotinus railed against the notion that the cosmos is inherently flawed. However, the highly sophisticated philosophical theology of the Gnostics, especially the so-called Sethian school (after Seth, the third and spiritually perfect son of Adam), remained a challenge to both pagan philosophy and emerging Christian dogma. Origen attacked Gnostic theology in several of his works, notably the *Commentary on the Gospel of John*. Plotinus wrote the treatise “Against the Gnostics,” included in the second book of his *Enneads*.

The Early Church Commentators

Interpretation of sacred writings was central to the creation of Christianity out of its Jewish and Greco-Roman social and cultural contexts. Early Christians had to decide how they would understand Jesus Christ (the “anointed one”) in light

of the Hebrew Scriptures and His relationship to the larger population of Rome in the first century CE. Some Christian groups, such as the followers of the Marcion (d. ca. 154 CE), rejected Jewish texts altogether. Others maintained that one had to be a Jew to be a Christian, strictly following Jewish ritual laws as contained in the Torah. The teachings that would become orthodox held a middle position on Jewish Scriptures. The Gospels accepted into the New Testament portray a Jewish Jesus who is a commentator on the Hebrew Bible, proclaiming Himself the fulfillment of its prophetic teachings and the Savior of the Greco-Roman world, not just of the Jews.

Commentators of the second and early third centuries CE continued to argue about the importance of Jewish Scriptures in their communities. Justin Martyr (d. ca. 165 CE) opposed those Christian groups who abandoned the Hebrew Bible. In his *Dialogue with Trypho*, he maintained that Christ had superseded the old covenant with the Jews but had not negated it. Irenaeus of Lyon (ca. 190) built upon Justin’s arguments in his *Against Heresies*, maintaining that the Jewish texts should be read typologically; that is, Christ is hidden in the text of the Hebrew Bible and made known through types and parables. This way of seeing the Scriptures became influential for later orthodox positions. It was developed and refined by subsequent Church Fathers such as Clement of Alexandria (d. ca. 211), who read the texts symbolically, and Tertullian of Carthage (d. ca. 222), who further

➤ ORIGEN’S THREEFOLD SENSE OF SCRIPTURES

Origen of Alexandria was one of the most important and controversial theologians of early Christianity. A renowned teacher and prolific scholar, he produced commentaries on virtually all books of the Bible and works that synthesized Christian theology. Origen was particularly regarded for developing one of the most influential hermeneutical techniques prior to Augustine. In Origen’s opinion, the Bible should be viewed with three discernable senses: literal, moral, and mystical. The literal sense contained references to things that actually took place. In his commentaries,

Origen often begins with this sense, though he believed that some Scriptures lacked literal meaning altogether. The moral sense was the edifying message of the text: the lesson that the text held for the reader. The mystical sense, which was behind all Scripture and was the most important to Origen, was influenced by Platonic philosophy. The mystical sense was the sacred truth that transcended the physical world. When uncovered, the exegete would reveal the true nature of God, bringing the reader into union with the divine.

—Dennis Quinn

maintained that the Scriptures foretold the coming of Christ. This attitude was refined by Origen of Alexandria, Egypt, who was executed during the Decian persecutions in 251 CE.

The Concepts of Orthodoxy and Heresy

The concept of orthodoxy (correct opinion) was unknown to the earliest Christians as was its antithesis, heresy (division arising from a dissenting opinion). As the early Church struggled to define itself in relation to the dominant culture, a wide variety of opinions arose, all of them vying for the exalted status of correct, or normative. The New Testament provides examples of early debates over questions that would later form the basis for dogma (institutionalized opinion), notably the role of Jewish law in the emerging Christian religion and the status of faith versus good works as the key to salvation. Given the fact that the New Testament writers themselves held diverse opinions on these and many other topics, centuries of often heated debate and sometimes violent disturbance occurred before anything resembling consensus emerged.

In early Christianity, the Hebrew Scriptures (or Old Testament) were the touchstone for matters of interpretation of the young faith. Several New Testament books include citations from the Greek translation of the Hebrew Bible (the *Septuagint*) in support of theological points. Perhaps the earliest manifestation of heresy is the rejection of these Scriptures as authoritative, as in the radical proto-Gnostic system of Marcion, who identified the God of the Jews with an ignorant and inferior—indeed evil—creator. While Christian orthodoxy did not come to mean unqualified acceptance of the Hebrew Bible as authoritative Scripture, it did utilize allegory as a method of

DEFINITIONS OF ORTHODOXY AND HERESY

The establishment of orthodoxy involved a long process. Early Christians did not agree on the basic tenets of the faith. Mysterious and paradoxical theories regarding the personhood of Christ and the meaning of salvation abounded. Greek philosophy served as the common language used to explain these notions. Heresy is best understood as the outcome of failed attempts to explain religious revelation in philosophical terms. Orthodoxy is properly understood as the philosophical reconciliation of human reason and the poetical claims of divine revelation.

—Edward Moore

squaring the laws and precepts of the so-called Old Testament with the sometimes divergent and even radical message(s) of the New Testament. By the end of the second century, both mainstream Christians and esoteric Gnostics were using the Old Testament for exegetical purposes. At this point, heresy and orthodoxy came into opposition regarding a more central aspect of the Christian faith, the person and status of Christ.

As the Christian era progressed, numerous theories regarding the person, status, and mission of Christ spread around the Roman empire, shaping the theology of the Church. In the era of the Ecumenical Councils, many of these theories were condemned as heretical, yet their influence remained and served to provide the language and philosophical foundation for later orthodox dogmatic theology. Chief among these heresies was docetism, which taught that Christ's Incarnation was only apparent, not real, that is, that He was a nonphysical spiritual apparition and therefore did not actually suffer in the Passion. Another prevalent heresy was that Christ was not truly God or even equal to the Father but rather a normal man, adopted by God as His Son. These heresies became enshrined in highly sophisticated systems associated with the names of Arius (Arianism), Apollinaris (Apollinarianism), and Nestorius (Nestorianism), among others. The longest-lived Christian-derived heresy was that of Mani, known as Manichaeism, that thrived from the third through

fourteenth centuries, in various forms, from Europe to Asia.

The definition of Christ as a single person containing two natures (divine and human) eventually became the standard of Christian orthodoxy in both the East and West, as did the doctrine of the Trinity as a single substance existing as three unique persons, all equally divine.

—Edward Moore

■ Introduction: Nonmonotheistic Religious Traditions

Polytheistic belief systems (the belief in more than one god) were widespread worldwide from 1000 BCE to 300 CE. The cultures of Greece, Rome, Africa, and the Americas were polytheistic, believing in a variety of deities. It is difficult to generalize about polytheistic beliefs and practices since polytheism lends itself to considerable diversity. The following entries provide examples of some of the polytheistic practices found throughout the world at this time with the exception of South and East Asia, which are treated in other sections of this encyclopedia.

—Kevin M. McGeough

Development of Greek and Olympian Religion

Olympian religion was polytheistic, with worship centering around the gods known as the Olympians, anthropomorphic beings consisting of Zeus, his siblings, several of his children, and Aphrodite, most of whom dwelled on Mt. Olympus. Within this polytheistic religion Zeus reigned supreme, although various spheres of influence were portioned out to various gods. Individual mortals and city-states could have particular favorites among the gods (e.g., sailors would seek to ensure the goodwill of Poseidon, while Athenians

➤ XENOPHON OF COLOPHON

The poet and philosopher Xenophon of Colophon (ca. 570–478 BCE) questioned the validity of the anthropomorphic nature of the Olympians, noting the tendency of Greeks (and people in general) to create their gods in their own image, investing their gods not only with human bodies but also human qualities and personalities. In particular, Xenophanes blamed the less than praiseworthy nature of the Greek gods on Homer and Hesiod, who “attributed to the gods all deeds that are a disgrace among men” including such crimes as adultery and theft:

“... but if cows and lions had hands and could draw with their hands and create art

like men do, they would draw the shapes of their gods and make their bodies just like their own, each god having a body like their own, horse gods having bodies just like horses, cow gods just like cows.” (Xenophanes, fragment B15 Diels-Kranz)

were fond of their patron god Athena), although sensible mortals would ensure that they treated all gods with the necessary respect and worship.

Our earliest literary evidence for the nature of Olympian religion is found in Hesiod and Homer. In their works, the Olympian gods are already fully formed, possessing their own characters, personalities, and areas of interest. For instance, Hesiod's *Theogony* narrates the creation of the universe, the gods, and the rise to power of Zeus, while the gods take a personal interest in the Trojan War in the *Iliad* and in Odysseus's fate in the *Odyssey*. Although the gods do appear already fully drawn in these early poems, with little variation to be found in later works regarding the essential nature of the gods, there is textual and etymological evidence to suggest that the Olympian gods were not portrayed as static. Accounts of Dionysus usually contain some element of initial hostility toward the god, who must fight to have his divinity recognized (e.g., Euripides' tragedy, the *Bacchae*) while iconographic representations contain a number of Eastern elements (e.g., loud, raucous music; exotic animals; foreign dress), suggesting that Dionysus was adopted or adapted from the East. The varying genealogy of Aphrodite (who is either the daughter of Zeus or his aunt) suggests a similar fluidity. Etymology provides further information, with a number of gods having names derived from the Indo-European language (e.g., Zeus, from the Indo-European root for "sky"). The evidence suggests that some gods may have entered the Greek world from outside and were adapted to Greek culture.

Later authors began to question the validity of the myths told about gods, in particular those myths that portrayed the gods in a morally reprehensible light. Plato wanted to banish poets and myths from his ideal city. While the average Greek likely did believe in the existence of the gods, belief in traditional mythology was undermined among the intellectuals and philosophies that rejected the traditional gods that began to appear (e.g., Epicureanism, Cynicism).

Greek and Roman City and State Cults

State cults of the Greco-Roman world provided divine support and legitimacy for political and ruling institutions. Although Greece and Rome constructed different governmental systems, politics in both societies was characterized by a fusion of religious and political authority.

Greek city cults varied depending upon each city-state, or polis. In Athens, the *demos* (the people) maintained the religious and political institutions. Citizens were always concerned with maintaining divine support. In Athens also, assemblies handled religious matters and addressed such topics as sacrifices, priesthoods, and temple construction. A typical assembly considered sacred matters first, then the more mundane political matters second. There was no organized priesthood in Greece, only individual priests and priestesses from individual temple sanctuaries.

Emperor Trajan pours libation as pontifex maximus at a sacrifice before battle with Dacians, in this detail from Trajan's Column. (The Art Archive/National Museum Bucharest/Dagli Orti)

These figures were often consulted in religious matters. People often consulted and almost always obeyed Oracles in important times. For example, Plato recommended consulting the Oracle of Delphi for the “founding of temples, and sacrifices, and other forms of worship of gods, daemons, and heroes” (Repub. 427b-c.). Oracles legitimated political practice by demonstrating the gods’ favor for certain actions. Thus, the gods retained ultimate authority in Greece. The demos, however, ultimately decided whether to consult the gods in a given circumstance.

In Rome as in Greece, religious authority rested in the hands of politicians. The senatorial aristocracy was charged with maintaining the *pax deorum*, or peace of the gods. In later years, following the lead of the first emperor, Augustus, the emperors adopted this role. Magistrates took auspices (studying bird behavior or animal livers in order to understand messages from the gods) and dedicated temples, while priests, appointed by the Senate, were considered the experts of ritual practices. Before meetings of the Senate, auspices were taken to discern the will of the gods before decisions were made about elections, making laws, and conducting wars. Romans considered the Senate house, where the Roman Senate met, a *templum*, a sacred space separated by rituals. In this way political and religious authority was fused at the heart of the Roman empire. By the late first century BCE, the emperor had adopted a religious role. For example, Augustus took the title of *pontifex maximus*, thereby becoming the head of the priestly colleges. The emperor thus became an intermediary between the people and the gods. Cults for the emperor were usually local, and it was not until the ascension of Constantine and his conversion to Christianity (312 CE) that emperors became intimately involved with the establishment of religious organizations.

The Roman emperors’ conversions to Christianity paired with the rise of episcopal power led to the first real separation of religious and political power in the Mediterranean world.

Greek and Roman Votive Art

“Ex-voto” is a Latin expression used as a generic name for a votive offering made to a divinity as thanks for the fulfillment of a wish. The term may be used in the context of any civilization, and while we might speak of Greek or Roman ex-votos, the term is also employed in discussing the art of more recent times. The quality of such offerings is naturally uneven, ranging between a classical style and something rather primitive, usually an indication of local production. Such offerings are not works of art but instead were simply intended to make the prayer last longer. The number of ex-votos found on a given site can enable an estimation of the importance of the sanctuary and the fame of its divinity.

Votive offerings are an important element of religion and help us to understand a certain form of devotion. Relations between a divinity and the faithful were based on a bargaining system. A devotee signed a kind of contract (the *votum*) with the divinity: “If you give me this, I will give you that.” It might concern a cure, success in trade, a safe journey, or even the health of the emperor. When the devotee considered that his wish had been granted, he had to respect his part of the bargain and give the promised offering. The expression *V.S.L.M.* (from the Latin *votum soluit libens merito*) on an offering showed that the devotee had thanked the divinity.

The offering was proportional to the realization of the wish and to the devotee’s means; it might consist of perishable items, objects of everyday life, wooden or marble statues, altars, and even entire temples. In healing sanctuaries such as those of Asclepius at Epidaurus or Corinth in Greece are found numerous anatomical votives in terra-cotta representing the affected part of the body: a leg, an eye, a breast, a womb.

Offerings in metal often have a hole in the top to fix them by means of a nail to a wooden

► BARKWAY TREASURE, BRITISH MUSEUM, LONDON

In 1743 a series of seven silver votive plaques and other metal objects were discovered in a quarry near Barkway (Herts). Five were dedicated to Mars, the god of war; the other two were dedicated to Vulcan, the god of fire.

These plaques are roughly shaped like palms or palm trees with volutes and are sometimes decorated with a fish-bone pattern. The largest votive plaque, exceptional by its size, is more than 19 inches (50 centimeters) long.

At the bottom an inscription or a human figure in a small temple refers to the divinity to be thanked: Mars shown as an armed and helmeted warrior, or Vulcan shown with his hammer and blacksmith's tongs.

The Role of Divination in the Classical World

Divination was the practice of gaining divine knowledge of things past, present, and future through signs, portents, oracles, and dreams. Gods of the Greco-Roman world were believed to possess a special understanding that came from their ability to see past, present, and future simultaneously. Mortals therefore hoped to gain access to such knowledge in order to ensure worldly success. The information provided through divi-

nation was not always obvious. Thus, their language needed to be interpreted by specialists trained to read it. The job of diviners was to bring out this information.

People from every level of society employed diviners. The Greek polis relied on divination in practically every major decision. At the political level, divination functioned as a means to determine whether the gods favored a particular action or to find out what the outcome of a particular official action might be. The prophetic utterances, however, needed to be read with caution. This was best illustrated by the case of the Lydian king Croesus (547 BCE). Before attacking the Persians, the Oracle at Delphi prophesied that a great empire would fall. Armed with the belief that his enemy would be defeated, Croesus went into battle but was captured by the Persian king Cyrus, only then realizing that the defeated empire would be his own. Thus, expert readings were always highly prized.

In Rome, the rhetorician Cicero wrote a treatise, *De Divinatione*, that provided the Stoic distinction between technical and natural divination, some of which came from Etruscan influences. As Cicero explained, technical divination was performed by specialists such as the *haruspices* (interpreters of the internal organs of animals, lightning, and other prodigies such as

Etruscan bronze mirror depicts a figure performing haruspices on the liver of a sacrificed animal. (David Lees/Corbis)

meteors), *augures* (diviners), astrologers, and other soothsayers. The Etruscans in Italy seem to have been particularly obsessed with the art of divination. Technical divination worked because, as Cicero noted, the gods love humans, “For they mean well and are friendly to humanity; they certainly know what they themselves have planned and established; it is definitely in our interest to know what will happen, for knowing it will make us more careful” (1.82). Natural divination, on the other hand, was obtained in a more passive manner by means of dreams and visions passed on to humans by divine instigation. “Since the universe is filled to the brim with a sense that lasts forever, and a mind that is divine, it follows logically that the spirits of men are directed by the contact with spirits divine” (1.110). This would usually occur in dream or trances believed to be instigated by the gods.

Shamanism in Central Eurasia

Derived from the Tungus word *saman* (“he who knows”), a shaman was a central figure in most central Eurasian societies of the ancient world. While the term has become synonymous with medicine man, witch doctor, and a wide variety of other religious figures, shamanism better describes the religious traditions of the nomadic and hunter-gatherer peoples of Siberia and the Eurasian steppes. In many ways, the shaman was more comparable to a psychiatrist than a priest. Unlike other religions, shamans did not have a standardized practice of rites and rituals. While many practices were similar, there was great variation in their roles and how they carried out their functions.

The shaman was not a priest but rather an intermediary between the mundane world and the spirit world. Entering an ecstatic state, the shaman used a variety of methods to cure and alleviate distress. As many illnesses were associated with the theft of one’s soul by an offended spirit, the shaman was essential to providing comfort and a cure. When the shaman entered a trance, his soul entered the spirit world to retrieve the lost soul. Also the shaman assisted with the ascension of one’s soul into the spirit world upon an individual’s death.

In addition to handling matters of life and death, shamans communicated with the spirit world. By using the acquired information, the shaman could then predict the future. This could take the form of scapulimancy (the reading of cracks in burned bones), augury (studying the behavior of birds), or allowing a spirit to possess the shaman’s body, thus allowing

THE SHAMAN

A person did not become a shaman by choice but instead was imbued with the ability at an early age. A shaman often possessed what would be termed psychological problems and may have suffered from a variety of seizures or hallucinations. In modern or even ancient agrarian societies, the shaman may have been a person who, due to these issues, would have been marginalized by society. However, in shamanic societies, the person

was viewed as having an affinity with the spirit world. Sometimes, a person acquired the abilities after a traumatic and unusual experience, such as being struck by lightning or recovering from a near-death experience. Furthermore, because a person had shamanic traits, this did not mean that the person wanted to be a shaman. Often the person needed to be coerced by the spirits.

—Timothy May

the spirit to communicate directly with the physical world.

The shaman not only protected his tribe from spirits but, in a sense, entered a relationship with the spirit world. Thus, the shaman was able to control spirits so that they assisted him. At the same time, the spirits could use the shaman to express their needs to the mundane world. As many of the local spirits were also ancestral spirits, this was a crucial role of the shaman. Without the shaman, society was exposed to psychic threats from the spiritual world and was thus vulnerable to a number of maladies. Only the shaman could deal with the spirit world and understand its needs.

Like any other religious profession, the shamans underwent rites of initiation and instruction by other shamans. Nonetheless, the position of shaman is often hereditary, which may not be surprising should the psychological or physical manifestation of shamanic ability be genetic. While most shamans tended to be male, female shamans were not uncommon, as the importance of ability was greater than gender considerations.

Mystery Religions in Roman World

The wide variety of mystery religions in the Roman world makes their definition difficult. In contrast to the collective political character of traditional Roman religion, mystery religions offered personal salvation and enlightenment through ecstatic initiations. The rituals and teachings themselves were a closely guarded secret accessible only to the initiated few but centered upon chthonic deities who transcended life and death.

Mystery religions originated in the Greek East. The most famous mysteries were those of Demeter and Persephone at Eleusis in Attica. Although originating in the eighth century BCE, the Eleusinian mysteries remained popular during the Roman period. Much of the extant sanctuary, at Eleusis north of Athens, dates to the second or third centuries CE when the Roman emperors Hadrian and Marcus Aurelius were initiates. The surviving telesterion, or hall of initiation, dates to Marcus Aurelius's rebuilding of the sanctuary after its destruction by Sarmatians in 170 CE. The sanctuary remained in use until 392 CE.

The earliest Eastern cult to arrive in the city of Rome was that of Dionysus, whose association with wine and intoxication offered an escape from social constraints. Evidence of rituals performed in honor of Dionysus—the “Bacchanalia”—were first recorded in Rome in 186 BCE when Livy records their suppression by the Roman senate. Individuals could join Dionysus either through the adoption of an ascetic

► SPECIAL LIFESTYLES ASSOCIATED WITH THE MYSTERY CULTS

Members of ancient mystery cults often distinguished themselves from noninitiates in diverse ways. In general, mystery cults promised a change in status for the initiate in relation to his or her god, which meant a perceived change in status within the society. Since membership into these cults required certain secretive and symbolic activities known only by other initiates (*mystai*), the social bond between members was often closer than any other institution in the classical world, including family.

Although the rites were secret, initiates were often candid about their membership in mystery cults. This was especially the case for their priests and priestesses. For example, the eunuch priests (*galli*) of Cybele castrated themselves, imitating the suffering god Attis (the divine consort and lover of the goddess) who bled to death under a pine tree after self-emasculation. These demasculinized individuals were held in high esteem in the classical world. Additionally, but less radically, priests of the Isis cult shaved their heads in honor of the Egyptian goddess. Also, initiates into her cult wore linen every day instead of ordinary wool as a visible marker of cult membership. Thus, regular members of mystery cults, often called *therapeutai*, sometimes distinguished their lifestyles from those who were not. This was the case for members of the mystery cult of Mithras; a religious group that allowed only men, it was especially popular for Roman soldiers, sailors, and bureaucrats. Initiates of this religious fraternity were believed to be reborn (*renatum*) into the family of the god and thus transformed their status both personally and socially. Initiates' lifestyle and religious identities therefore became inextricably linked.

lifestyle or through the drunken ecstasy of the Bacchanalia.

More influential was the ancient Persian god Mithras. Mysteries in honor of Mithras are first recorded among the Cilician pirates in the first half of the first century BCE. The worship of Mithras

spread widely through the Roman empire from the second half of the first century CE and was particularly popular among the soldiers stationed along the northern frontiers of Britain and Germany and along the Danube. Worshippers gathered in artificial caves that re-created the mythical

cave in which Mithras sacrificed a primordial bull bringing life into the world, re-created through the depiction of the tauroctony (bull slaying) and the partaking of a ritual banquet.

The cult of the Phrygian mother goddess Cybele, or Magna Mater (Great Mother), was invited to Rome in 205 BCE during the war with Hannibal. Games in her honor, such as the Ludi Megalenses, were instituted the following year, and a temple was dedicated to her in 191 BCE. At the culmination of her rituals the priest would castrate himself, offering his fertility to the goddess. Horrified, the Senate forbade Roman citizens to participate, and it was only during the reign of Emperor Claudius (41–54 CE) that the cult of Cybele and her son-consort Attis was officially recognized. The archaeological record indicates that these cults spread and developed somewhat later, from the first through the third centuries CE.

Celtic Religion

Apart from a number of rather famous quotes from ancient historians like Caesar, Diodorus of Sicily, Strabo, Pliny the Elder, and Lucan, the main sources for ancient Celtic religion are inscriptions and archaeological finds and features. Early medieval Irish and Welsh literature have also been frequently used to reconstruct “common Celtic” religion.

A closer look at the evidence reveals only a very few similarities, but a huge range of differences exists between the various Celtic religions practiced across Celtic Europe (and Asia Minor)

in the last few centuries BCE and the early centuries CE. The most obvious similarities—although they are limited to western Europe—exist in the terminology for some of the religious functions. The Greek geographer Strabo (*Geographika* 4.4.4) mentions bards, ovates, and druids, which are direct cognates to the Old Irish *baird*, *faithi*, and *druid*, respectively. Besides that, there are a limited number of names of deities—e.g., Lugh/Lugh and Ogmios/Ogma—that are relatively widely distributed in the Celtic west. Also, there is relatively widespread evidence of ritual deposition in watery contexts (rivers, lakes, springs, bogs), for human sacrifice (Gaulish “sanctuaries,” bog bodies), and for some elements of ancestral worship. The association of many different Celtic deities with only a handful of Classical counterparts indicates that local Celtic religious traditions seem to have followed the general Indo-European model relatively closely.

Other than that, however, much of ancient Celtic religion seems to have been very different, with local customs, traditions, beliefs, and practices by far outweighing widespread similarities. Thus, of the over 600 names of Celtic deities that have come down on us, only a very small number are attested more than once. Similarly, the archaeological record shows a wide range of differences in religious, sacrificial, and burial practices, which often also changed considerably over time, even on local scales. Where sacrificial depositions are concerned, while the selection of deposited goods often is relatively similar in much of Celtic Europe, the sites chosen as well as the layout of features sometimes found at those sites are very different. For instance, deposition, often associated with bridges and other riverside features in Switzerland, takes place in rectangular ditch enclosures in some areas of Gaul and in bogs and small lakes in much of Britain and Ireland.

It thus is impossible to reconstruct one Celtic religion. Rather, we have to assume that many different locally constituted Celtic religions existed in different areas of Europe in different periods of later prehistory that did share some common features, possibly some religious functions and a few gods but otherwise varied widely.

Olmec Shamanism and Religion

Olmec civilization is the oldest of the pre-Columbian high cultures. From its formative period (starting around 1800 BCE) to the so-called epi-Olmec phase (ending ca. 300 CE), Olmec society experienced a transition from the cultural stage of hunter-gatherers to stratified society with ruling elites. This long-term transition is reflected in the socioeconomic patterns and in related belief systems.

Eagle transformation figure, Olmec, tenth–sixth century BCE. (The Metropolitan Museum of Art/Art Resource, NY)

The belief system of an early stage of a hunter-gatherer culture can be identified in the relationship between human beings and nature. Since Olmec times, the intertwining of humans and animals is typical for the mythological traditions of Mesoamerican peoples, and this mythical pattern of interrelated existence of all living beings manifests itself in the themes and motifs of the visual arts. In the worldview of the early hunters in the rubber country, humans and animals were bonded, and their spirits could interact without the boundaries of later belief systems in which the world of humans is separated from that of animals.

Associated with the spirited worldview of the hunters is the central role of the shaman in the Pre-Classical communities. Shamans could be men and women who were not leaders with political power but rather experts of communication between the living and the supernatural beings, and as such they enjoyed undisputed authority. Shamans were thought to be able to transform themselves into animals through trance techniques or the use of hallucinogenic drugs. Numerous Olmec sculptures depict this transformation process.

Despite social changes that occurred with the transition to food production, the central role of the shaman in community life did not change although there was a shift in priority for his or her ceremonial activities, which had to focus on the interaction with those forces in nature that were responsible for the success of plant cultivation and the prosperity of the community. In view of this shifting of priority, the primary concern of the Olmec farmers was to seek support and blessing for their crops and the fertility of their animals. Lineages were defined according to the memory of founding ancestors. Burials were more carefully prepared, mortuary offerings became more varied, and it can be conjectured that ritual practices relating to burials became ever more elaborate. These observations suggest that the shaman's role extended to performing ceremonies associated with an ancestor cult.

The early agrarian communities were characterized by social and economic equality. The later period of the Olmec cultural horizon shows signs of an emerging social hierarchy of the population. When the transition from egalitarian com-

► CONTINUITY OF CULTS OF PRE-COLUMBIAN DIVINITIES—THE RAIN GOD AND THE EARTH MOTHER OF OLMEC COINAGE

Olmec art incorporates aspects from all three evolutionary stages of Olmec society. The typical features of Olmec art, in form and style, are distinguishable by circa 1150 BCE. This holds true also for the basic motifs and symbols that repeat themselves in later periods in manifold combinations and transformations.

The abundance of composite (i.e., hybrid) representations may be seen as an echo of the imagined interconnection between all living things and of the duality of human beings and animals. The composite figures may well be associated with ideas of spiritual transformation. The human-animal hybrids form a distinct class of imagery, associating shamanic transformation.

The emergence of divinities with individual profiles of mythical personality and related attributes in early agrarian society finds its visual manifestation in sculptures of gods and goddesses. The oldest figures of the Olmec pantheon are the rain god (derived from the basic figure of the were-jaguar) and the earth goddess, whose figure becomes later identifiable with Tlazolteotl,

the goddess of filth and mother of the maize god. Their imagery persists and proliferates throughout the religious canon of pre-Columbian civilizations. The cults of some divine figures of Olmec coinage are still popular today. In local Maya communities of Mexico and Guatemala, offerings are regularly made to the rain god Tlaloc at secluded sanctuaries.

The monumental head sculptures—undoubtedly the most impressive genre of Olmec art—may represent deified ancestors of ruling elites, mystified in their composite representation with human features mingling with those of the mythical jaguar, which is identified by some scientists as the collective totem animal of the pre-Columbian Mesoamericans.

munities to chiefdom and perhaps when local kingship occurred is not known. Some postulate the beginnings for this transition to hierarchically structured society as being the late second millennium BCE; others advocate a later date (that is, the first half of the first millennium BCE).

Social hierarchy in the Olmec civilization was somewhat diffuse and did not reflect distinctions of social classes as they are manifested in Maya, Zapotec, or Aztec society of later periods. In Olmec society, one lineage may have taken the lead over others, and its head (chief) assumed a prestigious status among the heads of other lineages. What can be observed from the archaeological record is a differentiation of two social groups, the great majority of villagers ruled by a small social elite whose authority symbolically accumulated in the hands of a prestigious head of lineage. It has been assumed that the shift of ceremonial centers that marks differences of cultural development may reflect a shift of power relations, that is, a change of social

elites. This stage of social development resembles the structuring of clan society in ancient China during the period of Shang rulers.

Chavín Shamanism

The religion of the cult at Chavín de Huántar (ca. 1600–400 BCE) probably focused heavily on concepts and practices drawn from shamanism.

➤ ONE CULT, MANY VISIONS

While we are certain that people participating in the Chavín cult took mind-altering substances, it is hard to know exactly what they took and when. One complicating condition of studying shamanic entheogen use in prehistoric South America is the wide range of available substances that might have been ingested alone or in combination.

Andean people made extensive use of common intoxicants such as alcohol and tobacco. In addition, early societies availed themselves of a large natural pharmacopeia. Available substances included mescaline from San Pedro cactus (*Echinopsis pachanoi*), a variety of other psychedelic tryptamines from plants and animals (*Viriola* spp, *Anadenanthera columbrina*, *Bufo marinus*), tropane alkaloids (*Brugmansia* spp and *Erythroxylum coca*), and psychoactive neurotoxins such as saxitoxin (found in *Spondylus princeps* and *calcifer*).

We might ask why people experimented with so many different substances given that most of them are toxic even in small amounts. One answer may be in the nature of the experiences themselves. Different tryptamines, tropanes, and neurological agents affect different pathways in the nervous system and create different mental effects. It may be that people took different substances as a way of achieving different mental states and accessing different parts of the supernatural world. Alternatively, the various entheogens may simply have provided adherents with different paths to the same altered reality.

—Jo Ellen Burkholder

As a historically documented form of religion found in many parts of the world, shamanism embodies a wide variety of beliefs and practices, not all of which are held in common. The art of Chavín de Huantar, however, suggests that several of the traits common to shamanism—the importance of animal spirits, the use of altered mental states, shamanic flight, and belief in transformation—were present on some level at Chavín. Architectural spaces at the Chavín temple also lend themselves to shamanic rituals.

Shaman (male) and shamanka (female) are usually people who communicate with the supernatural world by entering an altered mental state through an autoinduced trance, ascetic

practices such as fasting, and/or the use of hallucinogenic substances. Several indicators suggest that people involved with the Chavín cult took hallucinogenic drugs. One is the presence of drug paraphernalia—small trays, spatulas, spoons, tubes, and mortars and pestles—decorated with supernatural images executed in Chavín style. Among contemporary shaman of the Amazon, these instruments are used to prepare and ingest inhalatory powders high in psychoactive tryptamines. Supporting the use of inhalants, several of the tenoned heads that decorated the Chavín temple illustrate thick discharge from the nose and facial contortions, a common side effect of taking these substances. A second indicator is the common appearance in Chavín art of a cactus species known as San Pedro. San Pedro is high in mescaline and capable of producing hallucinations. Recent work suggests that people may also have made use of other substances derived from potato relatives and even spiny oyster (*spondylus*).

The particular animals illustrated in Chavín art also have shamanic associations and include snakes, felines, and birds. Shamans commonly speak of seeing snakes as part of their altered states, perhaps as interpretations of entoptic phenomena brought on by hallucinogenic substances. In Chavín art, snakes appear frequently either alone or as elements of larger figures such as the hair of important deities or other supernatural figures. The famous images on the Lanzón, Tello Obelisk, and the Raimondi Stone all serve as good examples of this. Amazonian shaman in particular also frequently refer to jaguars as spirit guides in the supernatural world as well as to their transformation into these animals so as to traverse the supernatural world. Spotted felines, perhaps jaguars, adorned the cornices of the consolidated temple and appeared in free-standing sculpture. Felines also loaned salient attributes such as prominent canines and claws to supernatural beings of all varieties. Alternatively, some shamans described flight associated with raptorial birds such as hawks or eagles as part of their altered-state experience. Birds adorning important portals and entranceways at the Chavín temple have been identified variously as hawks, harpy eagles, or perhaps macaws. Macaws may seem like an odd choice but may have

been viewed as special for several reasons including brilliant colors, unusual configuration of toes, bare skin patches on the face, a tendency to travel in pairs, long life span, not the least of which is its ability to mimic human speech.

Images expressing duality and transformation also figure prominently in the art of Chavín. Shamanic religions believe in the ability of shamans to mediate between the mundane world and that of the supernatural. This they achieve either through the help of an animal spirit or through personal transformation into an animal or spirit. Chavín's tenoned heads have been considered prime examples of depiction of various stages of transformation from human to animal and back. Shamanism also tends to focus on duality or complementarity and on the intersection or mediation of opposites. Chavín's location—equidistant from desert coast and tropical forest, at the conjunction of rivers—reflects these principals. Archaeologists have also pointed to the use of black and white stone, strombus and spondylus shells, highland and lowland animals, and images that make sense both right side up and upside down as further reflections of shamanistic dualism.

The temple complex at Chavín initially provided ideal spaces for the small-scale rituals typical of shamanism. People entered internal passageways or galleries through small patios, where rituals likely began. Galleries themselves

were narrow and allowed only a few people to enter an interior space at one time. Although the corridors were unlit, people navigated them by feel or by using entheogenic drugs, causing dilation of the pupils and improved vision in dark spaces. The complicated galleries mimicked long and winding journeys taken by shaman in the pursuit of esoteric knowledge with the goal of the journey being an audience with a supernatural spirit such as the Lanzon. In the later phases of the Chavín temple's operation rituals focused more on exterior spaces such as large plazas, where staged rituals in conjunction with visual and auditory effects could have provided shamanic-like experiences for large groups.

■ Introduction: Religious Developments in India

From 1000 BCE to 300 CE, the Indian subcontinent experienced a remarkable religious fluorescence. Over the course of less than 1,000 years, the traditions of Buddhism and Jainism—religious systems that are still practiced today—emerged. Hinduism, which had begun prior to 1000 BCE in the Vedic Age, continued to develop and expand and this period was particularly formative in the development of Hindu traditions.

The Vedic Age, which lasted from 1800 to 600 BCE, was the period in which many of the

central tenets of Hinduism were established and the Vedic texts, which are fundamental to Hinduism, were written. Hinduism refers to a diverse set of practices and beliefs and has remained widespread in India to the present day.

Buddhism and Jainism began around 500 BCE during a period of Indian history in which there was no centralized leadership. Rather, numerous city-states and small kingdoms ruled South Asia. In this context, wandering philosophers (*shramanas*) taught devoted followers, sometimes developing philosophical schools

based on their teachings. These philosophers sought answers to questions fundamental to human existence: What is the meaning of life? Is the current social order legitimate? Buddhism and Jainism are both legacies of wandering shramanas whose followers perpetuated and continued their teachings. After India was centralized under the authority of the Mauryan kings, King Aśoka converted to Buddhism, sending out missionaries to spread these teachings far and wide. Buddhist thought and practices began diverging, leading to the development of distinctly different traditions.

These three traditions (Hinduism, Jainism, and Buddhism) lasted until the present day in varying forms and in varying locations. All three of these traditions, however, are rooted in ancient India.

—Kevin M. McGeough

Early Brahmanical Hinduism

The years between 1000 BCE and 500 CE saw a large number of changes in the religious landscape of the Indian subcontinent. There were two major developments: first, philosophical speculations about concepts such as karma, rebirth, and the human soul, and second, the shift to temple-based worship of deities such as Vishnu, Shiva, and the Goddess.

Traces of the sacrificial concerns of the late Vedas can be found in the Upanishads, but reli-

gious thought and practices were undergoing a shift. For example, late Vedic religion identified the powerful speech that serves as the underlying substratum of the universe as Brahman. In the Upanishads, Brahman is the unchanging, eternal, indescribable ground of being. The Upanishads teach that the soul is likewise imperishable and unchanging. After death the soul is reborn based upon the person's karma. Karma (literally "action") referred to any morally consequential action that would bring about a result in the future, either the current life or a future one. Karma does not eliminate free will. Karma brings about a certain situation that living beings respond to, generating further karma. The accumulation of karma results in living beings' entrapment in *samsara*, the cycle of death and rebirth. From the Upanishads onward, the goal of Hinduism became to escape from this cycle. There were countless opinions about how to do this and the nature of the resulting state. Some Upanishads describe a series of heavenly realms accessed via sacrifice. Most, however, claim that meditative insight will enable the individual soul (atman) to merge with the Universal Reality, or Brahman. While scriptural study was deemed an important aid in this process, direct personal guidance by a teacher (guru) was said to be most helpful.

The other significant development in this period was the shifting pattern of worship. Vedic deities such as Indra, Agni, and Soma faded in importance. Vishnu, Shiva, and the Goddess, minor figures in the Vedas, came to hold a central place in most people's religious lives. Countless myths describe their aiding their worshippers, granting salvation, and battling forces of evil. As the Vedic pantheon faded in importance, so too did Vedic forms of ritual. The construction of temples to Hindu deities began at least as early as the third century CE and in time came to almost completely replace older ritual forms.

Many temples were constructed for the god Vishnu in one or more of his incarnations. Vishnu was represented as a cosmic ruler, the guardian and preserver of the cosmos who comes to earth in order to preserve righteousness generally by slaying the gods' demonic opponents. The *Ramayana* and the *Mahabharata*, Sanskrit epics composed between 400 BCE and

➤ EXCERPT FROM *THE BHAGAVAD-GITA*

[The soul] is not born,
it does not die;
having been,
it will never not be;
unborn, enduring,
constant, and primordial,
it is not killed
when the body is killed.

Barbara Stoler Miller, *The Bhagavad-Gita* (New York: Bantam, 1991), 32.

400 CE, tell the stories of Rama and Krishna, the two most important incarnations of Vishnu. Another god who rose to prominence in this period was Shiva. A model ascetic, he was often immersed in meditation in the Himalayas. He too had a cosmic role to play. At the end of each cosmic cycle, he would destroy the universe. He is often worshipped alongside the Goddess (Devi or Shakti). While the Upanishads had taught that spiritual wisdom would provide release from the round of rebirth, by the first century CE it was widely believed that devotion to a deity would accomplish this as well.

The Bhakti Movement, Shaivism, and Devotion to Vishnu

The bhakti (devotional) movements had two main sources. The first is the *Bhagavad-Gita*. This important Sanskrit scripture, part of the *Mahabharata* epic, is dated to the first century CE. In the course of a dialog between the god Krishna and his friend and disciple Arjuna, devotion is emphasized as a means of spiritual discipline. With one's mind fixed on god, one may then act without fear of karmic consequences. While previous centuries focused on ritual acts or meditative insight as means of making spiritual progress, the Bhagavad-Gita advocated devotion to Krishna as the best way of attaining *moksha*, release from the cycle of birth and death (*samsara*).

Early Hindu temples were built in the centuries following the Bhagavad-Gita. It was from this context of temple worship that the bhakti movement derived its second inspiration. During the sixth through eighth centuries CE, the earliest of the poet-saints of southern India wandered from temple to temple singing the praises of the gods. Their poetry was in Tamil rather

than Sanskrit. Drawing on the conventions of a secular poetic tradition as well as stories from Sanskrit mythology, these early poet-saints focused their devotion on either Shiva or Vishnu. The poetry they left behind attests to a different variety of devotion than that of the Bhagavad-Gita. While the latter extolled devotion to Krishna, this did not preclude ordinary life in the world. The Tamil poet-saints, however, subordinated everything to devotion to their gods. Whether they served Shiva or Vishnu, their only profession was singing the praises of their gods with an emotional fervor far from the detachment recommended by the Bhagavad-Gita. This emotional devotion to a deity became a hallmark of the bhakti movement. In the centuries following these Tamil saints, the bhakti movement spread north and west. Bhakti poetry was composed in all the regional languages of India. In many cases, these are the earliest extant works of literature in the vernacular.

The bhakti movement had no single founder, no common scripture, and no central institution. It did not even have a common deity. While one can classify movements as Shaiva (focused on the god Shiva), Vaishnava (focused on the god Vishnu), or Shakta (focused on the goddess Shakti), each devotee favored a particular divinity, often one enshrined at a specific location or with a specific local name. Often the deity was portrayed as the parent, companion, or lover of the devotee. Other devotees avoided placing any limits on the being they worshipped, including the limits of name and form. These devotees were known as adherents of *nirguna bhakti* (devotion to the formless [god]).

Regardless of the deity worshipped or the language spoken, the devotional movements all shared certain premises. Love of god was of central importance. Devotion should be offered not only to god but also to those who serve god. One speaks to god in one's mother tongue rather than reciting Sanskrit prayers, and reciting the name of god with devotion is often enough to ensure salvation. The bhakti movement allowed participation by women and members of the lower castes. Its impact on art, literature, and the religious lives of millions remains strong.

Jainism

Around the middle of the first millennium BCE, a movement emerged that challenged the spiritual supremacy of the Brahmin caste. According to this *śramana* (or “striver”) movement, the advanced goal of *moksha*, or liberation from the cycle of rebirth, could be attained by persons of any caste willing to exert the necessary effort.

A contemporary of the Buddha, Mahavira, the twenty-fourth Tirthankara, is believed to have lived from approximately 599 to 527 BCE. Statue of the Jain god, Mahavira, tenth century, Khajuraho in central India. (Anne Salaun/Roger-Viollet/The Image Works)

The shramana movement consisted of numerous sects, each with its distinctive understanding of the nature of the process of karma and rebirth and the means to reach liberation. The two shramana sects that have survived as distinct religions to the present day are Buddhism and Jainism.

Jainism is arguably the older of these two traditions. The contemporary Jain community traces itself to Vardhamana Jnatrputra, better known as Mahavira (the “Great Hero”) who according to one tradition lived from circa 599 to circa 527 BCE. If these dates are correct, then they would make Mahavira a senior contemporary of the Buddha, who, by Sri Lankan tradition, lived from circa 563 to circa 483 BCE. (The dates of both figures may need to be adjusted by as much as two centuries, depending upon the interpretation of particular pieces of archaeological and textual evidence.) But according to Jain tradition, Mahavira is not, strictly speaking, the founder of Jainism but instead the twenty-fourth in a series of great teachers who have discovered the Jain path and reestablished the Jain community. The twenty-third of these teachers, or *Tirthankaras*, named Parshvanath, was very likely an actual historical figure who lived about two centuries before Mahavira. According to the Jain scriptures, Mahavira’s parents were Jain practitioners in the tradition of Parshvanath.

The life story of Mahavira is parallel to that of Siddhartha Gautama, the Buddha. Both men are said to have been from the Kshatriya, or warrior caste, and to have been the sons of kings or tribal leaders in ancient northern India. Both are said to have left home at the age of 30 to become ascetics in pursuit of *moksha* and spiritual enlightenment. And both are said, by their respective traditions, to have achieved their goal.

There are also many similarities between Jainism and Buddhism. But whereas the Buddhist tradition was largely extinguished in India, albeit after having transplanted itself through missionary activity throughout Asia, the Jain community survives as a minority community in India to the present day. And whereas the emphasis of Buddhism is more psychological, focusing upon the motives that give rise to action

and addressing the many psychological factors involved in suffering, the emphasis of Jainism is sharply ethical and focuses upon correct action, chiefly in the form of the practice of *ahimsa*, or nonviolence in thought, word, and deed.

The Jain worldview posits a dualism of spirit, or *jiva*, and matter, or *ajiva*. The type of matter of greatest relevance to Jain practice is karma. Though the idea of karma as a principle of cause and effect is shared among Hindus, Buddhists, and Jains, the Jain view of karma is distinctive in seeing karma as a type of matter. It is the adhesion of karmic particles to the soul, or *jiva*, that keeps it tied to the cycle of rebirth. The Jain practices are designed to expel the karmic matter currently lodged in the soul as well as prevent further karmic influx. This twin goal is achieved through cultivating a state of inner equanimity and detachment, to which the practice of *ahimsa* is essential. When the soul is free from karmic matter, it experiences a state of omniscience called *kevala jnana*, followed by *moksha*, or liberation from the cycle of rebirth.

Jainism, like Buddhism, appealed to the merchant classes of the emerging cities of the Ganges Valley in the late first millennium BCE. The two dominant sects of Jainism are the Shvetambaras and Digambaras. These two sects differ with regard to monastic practice, yet they agree on the basic doctrine.

Life of the Buddha

The Buddha (literally “the Awakened One”) was the originator of Buddhist religious teachings (called the *dharmā*) and the founder of the Buddhist monastic order (called the *sangha*), which are among the most influential doctrines and in-

stitutions in human history. He was born Siddhartha Gautama, prince of the minor Sakya clan on what is today the border of India and Nepal. As a young adult he chose to renounce his position, his family, and his possessions in favor of the spiritual pursuits of asceticism, meditation, and homeless wandering. After 6 years, he achieved his goal of enlightenment or awakening (*bodhi*) and began a teaching career that was to last 40 years, until his death or supreme nirvana (*parinirvana*).

Scholars disagree about the precise dates of the Buddha's life, but it is generally accepted that he lived for 80 years and died sometime between 486 and 386 BCE. We know of him only through his followers, and his life story is a stylized and idealized product of centuries of sermonizing. It glorifies the Buddha's praiseworthy qualities and exemplifies the religious life that Buddhists are encouraged to emulate. In fact, Buddhists believe that Gautama Buddha was only the latest in an infinite line of Buddhas who have appeared in the world, and his life story is identical to that which all Buddhas, of all times, have lived although with different names. As such, the Buddha's life story is a central element of Buddhist doctrine in much the same way as the life story of Jesus is a central element of Christian doctrine.

The story begins in the blissful Tuita Heaven, where the future Buddha (called the bodhisattva) awaits the right moment to take on his last birth. He chooses to descend into the womb of Queen Maya, who dreams that a white elephant enters her through her side. After ten months she gives birth painlessly, miraculously, from her right side in the garden of Lumbini. Upon his birth, the future Buddha takes seven steps on his own and declares to all that this is his last rebirth.

The remarkable qualities of this new baby are confirmed by the court astrologer, who predicts that the boy will surely be an invincible conqueror, either a universal emperor or a conqueror of the spiritual realm, a Buddha. In line with this auspicious prophecy and the child's own confident declaration, the joyous parents bestow him with the name Siddhartha, which means “he whose goal is accomplished.”

➤ BUDDHA AND RENUNCIATION

The Buddha is among the world's most famous adherents of renunciation, leaving home in search of liberation from the cycle of rebirth. During his lifetime, however, he was only part of a growing trend among Indian religious practitioners. In the quote below, the Buddhist poet Asvaghosa imagines the Buddha's dialogue with his father, who thought, as many orthodox Hindus do, that a royal son should stay on as prince, become king, and only enter the forest as a renouncer once his sons are grown and his duties to family and royal lineage have been fulfilled.

"I will not enter the penance grove, O king, if you will be the surety for me in four things. My life shall not be subject to death. Sickness shall not rob me of my health. Old age shall not strike down my youth. And misfortune shall never plunder my wealth.

"If this course is not possible, then do not stop me, for it is not right to impede a man trying to escape from a burning house.

"Given that separation is certain in this world, is it not better to separate oneself voluntarily for the sake of religion? Or should I wait for death to separate me forcibly even before I have reached my goal and attained satisfaction?"

—Jonathan C. Gold

Source

Patrick Olivelle, trans. *Buddhacarita* 5.30–38, selections. From Donald S. Lopez Jr., ed., *Religions of India in Practice* (Princeton, NJ: Princeton University Press, 1995), 543.

King Siddhodhana, the father of the bodhisattva, wants his son to succeed him and become a universal emperor, not a mendicant sage. To this end, the king surrounds his son with beauty and joy and sequesters him from the world's troubles. Siddhartha succeeds masterfully in all of his studies and for 29 years enjoys the pleasures of the palace, including a wife, a son, and an extensive harem. But he eventually sets his mind upon seeking the outside world, and his father cannot prevent him. When he

does finally venture out, the future Buddha encounters what are termed the four sights—old age, sickness, death, and renunciation—that are human possibilities he had not known about before.

He understands immediately that the only proper response to the realities of old age, sickness, and death is the path of renunciation: leaving behind home, family, and worldly enjoyments in pursuit of liberation from death and rebirth. He sneaks out of the palace that very night and in a dramatic gesture symbolizing his severing of all attachment to the vanities and distractions of his old life cuts off his hair. This act is replicated in Buddhist monastic ordination ceremonies to this day.

As a wandering mendicant, the future Buddha quickly masters all of the forms of meditation and asceticism to which he puts his hand. But he is never satisfied that he has reached his goal until one night when he makes a vow not to leave his meditation spot until achieving liberation from the round of birth and death. After a night of meditation under the so-called Bodhi tree (a site of worship to this day), he faces down the threats and temptations of the demon Mara and eventually achieves his goal of awakening.

He soon gathers numerous disciples, many of whom realize nirvana themselves and are sent across the world to spread the Buddha's teachings (the dharma). At 80 years of age, with the final words "Decay is inherent in all component things! Work out your salvation with diligence!" the Buddha peacefully passes into nirvana for the last time. He refuses to name a successor to lead the sangha, saying instead that thenceforth the dharma must be the monks' teacher. His cremated body is said to have left behind 80,000 relics, which were immediately claimed by a variety of competing parties, and irresolvable divisions within the sangha began.

Theravada Buddhism

Theravada Buddhism is the only surviving member of the early Buddhist schools that grew up in the centuries immediately following the death of the Buddha. Meaning “The Doctrine of the Elders,” Theravada is a self-consciously conservative school. It is the dominant religion today in Buddhist Southeast Asia, in particular Sri Lanka, Thailand, Cambodia, Burma/Myanmar, and Laos. The term “Theravada” is often used anachronistically (as here) to refer not just to the surviving Theravada school but also to early Buddhism more generally. The Theravada scriptures provide the bulk of existing evidence of early Buddhism, and the term “Theravada” is preferable to the derogatory term “Lesser Vehicle” (Hinayana) used by many later self-styled Great Vehicle (Mahayana) Buddhists. What follows, then, applies to all of non-Mahayana Buddhism and not just the Theravada school (but, italicized terms are in Sanskrit, not the Theravada scriptural language of Pali).

A Buddhist is anyone who goes for refuge to what are termed the Three Jewels: the Buddha (lit., “The Awakened One”), the *dharma* (the teachings and mode of practice outlined by the Buddha), and the *sangha* (the community of monks and nuns who pass on the Buddha’s teachings). At a minimum one must recite three times the refuge prayer: “I go for refuge to the Buddha, I go for refuge to the dharma, I go for refuge to the sangha.” All three of these elements are considered proper objects of reverence, and their worship brings not only an ultimate refuge but countless worldly benefits as well.

The Buddha’s own achievement of enlightenment or awakening (*bodhi*) and the blissful mental state of *nirvana* that it allowed were the culmination of his countless lifetimes of good works. In the dharma he provided not only a description of reality but also a path of practice that anyone could follow to nirvana, although the ultimate goal might take many lifetimes to reach. Most Buddhists, it must be admitted, choose to cultivate good works in the hopes of a better rebirth, deferring the difficult practices of monasticism and meditation to future lives.

The dharma is concisely summarized in the Four Noble Truths that the Buddha taught in his

➤ THERAVADA MONKS AND LAY SUPPORTERS

While the ultimate goal of Buddhists is to achieve final release from suffering, or *nirvana*, very few seek this very difficult goal directly. Instead, most seek to store up merit (*punya*) in the hopes that a lifetime of good actions (*karma*) will bring improved rebirths and perhaps make *nirvana* easier to attain in the future. The best way to gather merit, then, is to make donations in support of the *sangha*, as these donors do. The monks are representatives, upholders, and teachers of the *dharma*, so supporting them is especially meritorious because it extends the life of the Buddha’s teachings in the world. In addition to providing lay supporters with the benefit of a meritorious rebirth, monks give them teachings, perform protective rituals, and officiate at funerals, all of which help the monks to store up their own merit as well.

—Jonathan C. Gold

Theravada Buddhist monks receive alms, Laos. (Nguyen Thanh Long)

First Sermon. First is the truth of Suffering (*dukkha*), which is essentially a declaration that desire and deprivation, birth, old age, sickness and death are unpleasant and unsatisfying phenomena that permeate and dominate the experience of all beings throughout the universe. Second is the truth of the Cause of Suffering, which is essentially a declaration that out of ignorance, all beings act on their desires in ways that only cause their own suffering, through unending rebirths (this is the Buddha's explanation of karma, on which there is more below). Third is the truth of the Cessation (ending) of Suffering, which is a declaration that the causes can be eliminated and the cycle defeated, what the Buddha calls nirvana (quenching). Fourth, and finally, is the truth of the Path, the path that if followed brings about this cessation of suffering, which is a description of exactly how one may achieve release by cultivating one's wisdom, virtue, and meditation.

In opposition to most of his Indian contemporaries, the Buddha taught that there was no self (*ātman*), or eternal soul, and no eternal gods. Instead, all things are impermanent (*anitya*), constantly changing and therefore subject to decay, which is why the Buddha believed in long-lived gods but taught that even they are insufficient as final refuge. All beings, including gods, hell beings, humans, animals, and ghosts, are born as they are because of their past morally significant actions (karma). If you are a thief, you might become a jackal in your next life, and it may be many lifetimes before you are lucky enough to be reborn again as a human.

The Buddha taught several forms of meditation, but perhaps his most innovative and distinctive form is the analytical mindfulness meditation in which one categorizes all experiences into a limited set of types, noticing and classifying each. For example, when you experience a sound, know you are experiencing a sound; when you have a lustful thought, know you have a lustful thought. The Buddha credits this practice, combined with single-pointed concentration, with bringing about his own final realization.

Members of the Buddhist sangha take vows to abide by hundreds of rules—including celibacy and not eating after noon—but the tradi-

tion calls itself a middle way between worldly pursuits and the more stringent asceticism practiced by most mendicants in the Buddha's day. Monks—especially virtuous learned monks—are considered a field of merit into which lay supporters can plant seeds of their future positive rebirths by donating food and supplies. This fruitful exchange has allowed the Buddhist tradition to persist and expand through some 25 centuries.

Mahayana Buddhism—Religious Developments in India

The movement that would call itself Mahayana (Great Vehicle) Buddhism began to emerge around the first century BCE in a variety of traditions that emphasized the superlative powers of Buddhas and bodhisattvas (future Buddhas). Practitioners worshipped texts termed Mahayana Sutras, which embodied the Buddha in his form as the *dharmā* (teachings, truth); they described and visualized and prayed for rebirth in heavenly realms where they could meet with Buddhas who taught there; and they believed that the supreme knowledge (*anuttarajñāna*) of Buddhahood should be the central goal of all Buddhists. The Mahayana scriptures emphasize, above all else, the cultivation of a Buddha's two basic mental characteristics: (1) The discerning Wisdom (*prajñā*) that perceives the falsity of all conceptual constructs and (2) the Great Compassion (*mahakaruna*) that seeks to relieve all beings from suffering of every kind.

Many Mahayana practices and beliefs simply extend earlier Buddhist trends. Yet the belief that everyone should aspire to become a Buddha clearly sets Mahayana Buddhists apart from their

rivals, whom they derisively term Hinayana (Inferior Vehicle). The non-Mahayana traditions held that since Buddhahood was an extremely rare and special achievement, most people needed only to aspire to the lesser but still magnificent goal of becoming an arhat. An arhat was an awakened disciple (*sravaka-buddha*), someone who had achieved perfect enlightenment after hearing and practicing the teachings of a Buddha. The Buddha's chief disciples became arhats, and self-styled arhats were presumably the leaders of the monastic establishment in the centuries following the Buddha's death. An intermediate kind of achievement, called a Solitary Buddha (*pratyeka-buddha*), was someone who discovered the dharma on his own without needing to hear the Buddha's teachings. A full Buddha, however, has not only realized the dharma on his own but is also capable of establishing the teachings in our world on a firm footing. Early Buddhists believed that only a Buddha could make enlightenment available to lesser beings, but once one has done so (through his teachings), the sensible goal for the rest of us should be arhatship.

Mahayana Buddhists argued that on the contrary, anyone with a truly great aspiration would seek nothing less than the highest goal of Buddhahood. They criticized as selfish the desire for the individual enlightenment of arhatship. Whereas arhats sought to free themselves from suffering as soon as possible, bodhisattvas sought to become Buddhas in an effort to free all beings from suffering. Rather than dedicating their good works to achieving a better life or a better rebirth for themselves and their loved ones alone, Mahayana practitioners dedicated their merit to the achievement of supreme knowledge by all beings. This is seen in inscriptions beginning from the fourth century CE, although some of the scriptures that form the basis of the Mahayana date from as early as the first century BCE.

Mahayana scriptures praise those beings who choose the more compassionate but far longer and more difficult path of the bodhisattva, and they exalt and maximize the achievements of Buddhas and advanced bodhisattvas. The Mahayana pantheon grew to include numerous new celestial Buddhas and bodhisattvas whose

➤ BODHISATTVA IMAGE FROM GANDHARA

Bodhisattva statue from Gandhara, second-third century CE. (Burstin Collection/Corbis)

Some of the earliest Mahayana Sutras advocated the practice of “recollecting the Buddha” through meditative visualization, though the direct worship of images has always been a less arduous method of achieving a visual encounter with the Buddha. Images of bodhisattvas (future Buddhas) are easily distinguished from full Buddhas by their ornamental jewelry and decorated clothing, which are signs of royalty. The Buddha was born a prince, but he renounced his royal position (cutting off his long hair, and abandoning his elegant clothing and jewelry) to become a wandering ascetic for six years before achieving Buddhahood.

—Jonathan C. Gold

many lifetimes of compassionate acts had earned them the ability to grant blessings to their supplicants. Many of the most popular deities in Asian history are embodiments of this celestial compassion: Akshobhya, Amitabha/Amitayus/Amida, Avalokiteshvara/Chenrezi, and Tara/Guanyin/Kannon. On the wings of their praise, Mahayana Buddhism would rise to become the dominant religion across Asia in the middle of the first millennium CE.

The miraculous compassion of the Buddhas and bodhisattvas also became the basis for a new doctrine of the nature of the Buddha(s) and the dharma. The historical Buddha, Siddhartha Gautama, came to be understood as only an emanation, a transformation body of his celestial form, called Shakyamuni Buddha, who in fact reigned over a vast Buddha field of countless worlds. It was taught that the Buddha did not actually die or teach or do anything that Gautama was traditionally said to have done. Rather, he was only appearing to do so out of compassion for the sentient beings who benefited from the experience. These apparitions and the teachings that issued from them were merely an expression of the celestial Buddha's skillful means (*upaya*). Under this view, most of the Buddha's teachings need to be understood not as ultimate truth but as only conventional truth, pragmatically beneficial teachings directed toward the needs of disciples of particular levels of understanding. Such a doctrine accounts for the variety and apparent inconsistency within the Buddha's teachings including,

not insignificantly, the divergences of the Mahayana Sutras themselves.

The first great philosopher of the Mahayana, Nagarjuna (ca. 100 CE), justified the Mahayana Sutras with a philosophy called the Madhyamaka (Middle Way). Nagarjuna elucidated the two truths just mentioned as a distinction between ordinary perception, cognition, and language on the one hand (conventional truth) and the emptiness (*śūnyata*) of those perceptions and cognitions on the other (ultimate truth). He argued that nothing really has an unchanging, intrinsic, essential nature (*svalakṣaṇa*), and yet our words are always ascribing stable, discrete identities and characteristics to what is unstable, interconnected, and relative. As a consequence, Nagarjuna believed that all language and concepts should be understood as only conventional designations (*prajñapti*). Although Nagarjuna was careful to explain that the concept of emptiness was itself only a conventional, skillful designation, he and his followers were labeled by their opponents as Shunyavadins, or Nihilists: adherents of nothingness.

■ Introduction: Philosophical and Religious Developments in East Asia

Beginning in the Eastern Zhou dynasty (771–256 BCE), East Asia saw the birth of some of the most important philosophers in world history, philosophers who established many of the worldviews that would come to dominate East Asian society well into the present.

There are two main periods that fall within the scope of the Eastern Zhou dynasty. The first

is the Spring and Autumn period (722–481 BCE) when the great philosopher Confucius lived (ca. 551–479 BCE) and his students wrote down his teachings. The second period (and the last period) of the Eastern Zhou dynasty was the Warring States period (403–221 BCE). This was, as the name suggests, a time of tremendous conflict in China as the decentralized authority of

the Zhou empire decayed. It makes sense, then, that philosophers were concerned with understanding the nature of governance and power. Daoist philosophy, a tradition that seeks to understand the proper balance of the universe and is at odds with Confucian beliefs, also emerged in this chaotic time. Buddhism arrived in China from India sometime in the first century CE, and while it took a long time for Buddhism to develop into the dominant tradition in China, it certainly added to the multiplicity of traditions present in China in this period.

—Kevin M. McGeough

Confucius

Confucius (551–479 BCE), known in Chinese as Kongzi (Master Kong), was born in the small feudal state of Lu in what is now Shandong province in northeastern China. He lived between the social instability of the Spring and Autumn period (770–481 BCE) and the descent into violence and chaos known as the Warring States period (403–221 BCE). Eminent Chinese historians as well as Western scholars have likened his role in Chinese and East Asian cultural history to that of Jesus or Socrates in the West. Although Confucius famously asserted that he simply transmitted the teachings of the sages of the past and did not create any sort of novel or personal teaching, his legacy led to new and lasting intellectual, literary, philosophical, political, religious, and social developments not only in China but also in Korea, Japan, and Vietnam. As a culturally symbolic figure, Confucius has been alternately idealized, deified, dismissed, vilified, and rehabilitated over the millennia by both Asian and non-Asian thinkers and regimes. Discourse about Confucius persists today as an arena of contestation over East Asian identity, modernity, and values.

During Confucius's lifetime, what now is northern China enjoyed no political unity and suffered from the internecine warfare of small states, remnants of the once-great Western Zhou dynasty that collapsed after barbarian invasions in 771 BCE. For more than 300 years after Confucius's birth, the Chinese would fight each other for mastery of the empire lost by the Zhou. In the process, life became difficult, especially for the

retainer or knight (*shi*) class from which Confucius himself arose. As feudal lords were defeated and disenfranchised in battle and as the kings of the various Warring States began to rely on appointed administrators rather than vassals to govern their territories, these *shi* became lordless anachronisms and fell into genteel poverty and itinerancy. Their knowledge of aristocratic traditions, however, helped them remain valuable to competing kings, who wished to learn how to regain the unity imposed by the Western Zhou and who sought to emulate the Western Zhou by patterning court rituals and other institutions after those of the fallen dynasty.

As *shi* became itinerant antiquarians, they found themselves in and out of office as the fortunes of various patron states ebbed and flowed. Confucius is said to have held office for only a short time before withdrawing into scholarly retirement. While out of office, veteran *shi* might gather small circles of disciples, young men from *shi* backgrounds who wished to succeed in public life. Some, such as Confucius, became known as scholars (*Ru*), the ritual masters and teachers of the courts of the various Warring States that, soon after Confucius's death, contended for the violent reunification of northern China into a new imperial order. It is precisely such master and disciple exchanges between Confucius and his students that the text known as the *Analects* (*Lunyu*), a collection of sayings and biographical anecdotes that was edited by generations of Confucians culminating in the Han dynasty (206 BCE–220 CE), claims to record.

Like nearly every thinker of his time, Confucius interpreted social disorder as evidence that human beings had lost a once-harmonious relationship with the Way (*dao*), the source of all life and order in the universe. In framing his vision of the Way, Confucius relied on a number of Western Zhou sources, including historical documents, governmental decrees, poetry, and ritual texts, that were later given the title "classics" or "scriptures" (*jing*). Confucius used Western Zhou culture to formulate a challenge to his own times. He encouraged his disciples to emulate the sages of the past and restore the moral integrity of the state. Most of his ideas, as described in the *Analects*, have to do with Heaven (*Tian*), morality, and politics. These ideas in turn

THE CULT OF CONFUCIUS

During the Han dynasty (206 BCE–220 CE), numerous hagiographical accounts of Confucius's origins and deeds were produced, many of which would startle readers familiar only with the *Analects*. According to various texts, Confucius was a superhuman figure destined to rule as the uncrowned king of preimperial China. At birth, his body was said to have displayed special markings indicating his exemplary status. After his death, he was alleged to have revealed himself in a glorified state to his living disciples, who then received further esoteric teachings from their apotheosized master. Eventually, and perhaps inevitably, he was recognized as a deity, and a cult organized itself around his worship.

Such mythmaking was very important to the emerging imperial Chinese state, however, as it struggled to impose cultural unity on a vast and fractious territory during the final few centuries BCE and beyond into the Common Era. Han emperors and their ministers seized upon Confucius as a vehicle for the legitimation of their rule and the social control of their subjects. The Five Classics—five ancient texts associated with Confucius—were established as the basis for the imperial civil service examinations in 136 BCE, making memorization of these texts and their orthodox Confucian interpretations mandatory for all who wished to obtain official positions in the Han government. This precedent was honored by all but a few succeeding regimes.

State endorsement of Confucianism persists into modernity. In Taiwan, the Nationalist government has promoted Confucianism in order to

Apricot Platform of the Temple of Confucius, Qufu, Shandong Province, China. This is the oldest temple of Confucius, located in his hometown, originally established in 478 BCE. (Rolf Mueller)

distinguish itself from the iconoclastic communists who won control of mainland China. Most recently, the mainland government has backed the restoration of old imperial temples to Confucius as refuges for the old and the construction of new Confucian academies for the young.

—Jeffrey Richey

form the basis of what became Confucian thought, which continued to develop long after Confucius's death.

Tian was the name of the supreme deity worshipped by the Western Zhou kings, whom they believed granted them power on earth to rule as long as they maintained high moral standards, the so-called Mandate of Heaven (*Tianming*). Confucius taught that Heaven was morally good and brought all things into being but depended on human beings to put its will (which could be known by sages) into practice. In this sense, Heaven seems to combine elements of what elsewhere might be called fate or

nature as well as god without being limited strictly to any one of these. Heaven's greatest gift to humanity was a capacity for morality (*de*) that, according to Confucius, it directly implanted within every human being.

Yet not every human being, in Confucius's view, fulfills his heavenly moral potential. *Analects* 4:16 describes the "profound person" or "gentleman" (*junzi*) as one who focuses on morality, while those who focus on personal profit are "small persons" (*xiaoren*). The profound person or gentleman puts his Heaven-sent morality into practice by cultivating and maintaining harmonious social order through good taste,

good manners, and good relationships. Good taste could be expressed by a well-performed ritual or an appropriate quotation from ancient history or poetry. Good manners could be expressed by demonstrating a sense of one's place in hierarchical society (filiality or *xiao*), as in parent-child or ruler-subject interactions. Good relationships flowed from the models established by good taste (such as the sage-rulers and ideal sons of Confucian lore) as well as from ritualistic adherence to good manners (through careful observation of propriety or *li*). Those who cultivate their moral natures are crucial to their neighbors' human flourishing, as *Analects* 12:19 asserts: "The moral force of the profound person is like the wind; the moral force of the small person is like the grass. Let the wind blow over the grass and it is sure to bend."

Thus, political concerns are inseparable from moral concerns in Confucius's thought. *Analects* 2:3 credits ritual propriety and moral rectitude with establishing lasting political order: "Govern the people with moral force and regulate them with ritual, and they will possess shame, and moreover, they will be righteous." Living in a world defined by chaos and conflict, Confucius was anxious to find a way to restore the golden age of unity that he attributed to the fallen Western Zhou dynasty. Like other early Chinese thinkers, Confucius pinned his hopes on the appearance of a sage-ruler who would combine political power with moral wisdom, unify the fractured empire, and usher in a new age of harmony and prosperity. According to *Analects* 2:1, "One who rules by morality may be compared to the North Star—it occupies its place and all the stars pay homage to it." Although his hopes never were fulfilled during his lifetime, from the second century BCE on, nearly every Chinese dynastic state endorsed Confucianism, and generations of scholar-officials worked earnestly to put Confucius's principles into practice.

Confucian Thought

Confucian thought bases itself on the teachings of Kongzi (ca. 551–479 BCE), a Chinese thinker better known in the West as Confucius. These teachings are recorded in the text known as the *Lunyu* (*Analects*). According to *Lunyu* 7:1, Kongzi "transmitted, but did not innovate." What Kongzi claimed to transmit was the *Dao* (Way) of the Western Zhou dynasty (1100–771 BCE), which he idealized as an alternative to his own Spring and Autumn period (770–481 BCE), a time of increasing social disorder. As the learned guardian of tradition, he challenged his disciples to emulate the sages of the past and restore the moral integrity of the state. Most of his

Silk painting depicts Kongzi discussing filiality (*xiao*) with his disciples. The painting was probably created during the Song dynasty (960–1279 CE), when Confucianism attained unprecedented influence on all aspects of Chinese life. (Howard Sochurek/Time & Life Pictures/Getty Images)

ideas, as described in the *Lunyu*, have to do with *Tian* (Heaven), morality, and politics. These ideas in turn form the basis of what became Confucian thought.

Tian was the name of the supreme deity worshipped by the ancient Zhou kings, whom they believed granted them power on earth to rule as long as they maintained high moral standards. Kongzi taught that Tian was morally good and brought all things into being but depended on human beings to put its will (which could be known by sages) into practice. In this sense, Tian seems to combine elements of what elsewhere might be called fate and nature as well as god without being limited strictly to any one of these. Later Confucian thinkers such as Xunzi (ca. 310–ca. 220 BCE) saw Tian as more or less identical with nature and rejected the tendency to think about Tian anthropomorphically (as a person). This naturalistic view of Tian became dominant among later Confucian thinkers.

Morality is the primary concern of most Confucian thought. For Kongzi, morality consisted of maintaining harmonious social order through good taste, good manners, and good relationships. Good taste could be expressed by a well-performed ritual or an appropriate quotation from ancient history or poetry. Good manners could be expressed by demonstrating a sense of one's place in hierarchical society, as in parent-child or ruler-subject interactions. Good relationships flowed from the models established by good taste (such as the sage-rulers and ideal sons of Confucian lore) as well as from ritualistic adherence to good manners (through careful observation of etiquette and ritual [*li*]).

After Kongzi's time, a Confucian thinker known as Mengzi (Master Meng) or Mencius (ca. 372–289 BCE) developed a moral psychology that eventually was accepted by most Confucians. According to the text that records Mengzi's teachings, "By fully developing one's mind, one knows one's nature, and by knowing one's nature, one knows *Tian*" (*Mengzi* 7A1). For Mengzi, the journey toward morality begins with birth as a being that naturally is oriented toward goodness (*ren*). One then proceeds toward maturity, guided by the examples of ancient sages and the ritual forms and texts they have left behind, habitually doing what is right until one uplifts oneself from

the merely human to that which Tian intends for one, which is to become a sage. Nature is crucial to moral development, but so is nurture. Mengzi's model of moral psychology involves both discovery (human nature is good) and development (human nature can be made even better).

Xunzi questioned many of Mengzi's teachings, especially his claim that human beings are born with a predisposition toward *ren*. For Xunzi, human beings were born with a natural tendency toward selfishness and disorderly conduct, which had to be overcome through the corrective power of culture. Nonetheless, both Mengzi and Xunzi taught that human beings are capable of moral perfection and that cultural formation through ritual and textual education is the key to achieving this perfection. The idea that human beings are incapable of moral self-transformation is completely alien to both Mengzi and Xunzi as well as the teacher whom both revered, Kongzi. In this sense, Confucian thought has no concept analogous to the Western notion of original sin.

Political concerns are inseparable from ethical concerns among Confucian thinkers. Living as they did in a world defined by chaos and conflict, Confucian thinkers were anxious to find a way to restore the golden age of unity that they attributed to the fallen Western Zhou dynasty. Like other early Chinese thinkers, Confucians pinned their hopes on the appearance of a sage-ruler who would combine political power with moral wisdom, unify the fractured empire, and usher in a new age of harmony and prosperity. According to Kongzi, "One who rules by morality may be compared to the North Star—it occupies its place and all the stars pay homage to it" (*Lunyu* 2:1). For Mengzi, only a ruler who enjoys the *ming* (moral mandate) of Tian can bring order to a state; should a ruler fail to do so, his subjects are entitled to rebel against him and replace him. Xunzi, like most Confucian thinkers, saw the ruler-subject relationship in familial terms, with the ruler as the all-powerful father entrusted with the care of his dependent subjects. Occasionally, Confucians expressed frustration about the gap between the ideal of a Tian-sent sage-ruler and the reality of their brutal and disorderly world. This frustration became especially acute during the Warring States period (403–221 BCE) in which the rulers of small states com-

peted for domination through constant intrigue and warfare.

Confucian thinkers were persecuted, along with members of many other early traditions, during the short-lived Qin dynasty (221–202 BCE). The succeeding Han dynasty (206 BCE–220 CE) adopted Confucian thought as a tool for legitimizing its power and controlling its subjects. In 136 BCE the Han government established Confucian texts as the basis of its civil service examinations, making Confucian thought a mandatory subject for all who wished to obtain official employment. During this period, Confucian thought took on many recognizably religious aspects, including the ritual worship of Kongzi in state-sponsored temples. After the fall of the Han in 220 CE, Confucian thought fell out of official favor as a series of warring factions struggled for control of China during the Period of Disunity (220–589 CE) and as foreign and indigenous religious traditions such as Buddhism and Daoism rivaled Confucianism for the attentions of the elite. Confucian thought never retreated entirely, however, and subsequent dynasties restored its position as the preeminent intellectual tradition of Chinese elites.

Daoist Philosophy

"Daoist philosophy" is the term used to describe a distinctive set of ideas about human beings, the natural world, and society that emerged in China during the Warring States period (403–221 BCE). While these ideas and their sources

vary, they share rejection of Confucian thought. Confucian thought taught its disciples to become moral, politically engaged, and ritually accomplished. Daoist philosophers, as we call them, tended to be skeptical about moral judgments, suspicious of political idealism, and contemptuous of rituals.

The two primary sources for Daoist philosophy are the texts known as the *Zhuangzi* (*Master Zhuang*) and the *Laozi* (*Master Lao*) or *Daodejing* (*The Classic of the Way and Power*), both of which date to some point during the fourth century BCE. The commentaries of the *Xuanxue* (*Dark Learning*) thinkers Wang Bi (226–249 CE) and Guo Xiang (d. 312 CE) shaped both the later form and interpretations of these texts. Other important texts include the *Guanzi* (*Master Guan*) and the *Huang-Lao* (*Yellow Emperor-Laozi*), which can be dated to the fourth century BCE and the early Han dynasty (202 BCE–220 CE), respectively. All of these texts and thinkers focus on the term *Dao*. Dao means "Way" and in Daoist philosophy takes on additional meanings such as "cosmic pattern," "cosmic principle," "nature," and "ultimate" or "transcendent." Dao might best be understood as the unseen, impersonal order of the universe with which humans should strive to be in harmony. It is this sense of the term that unites these otherwise distinct sources of Daoist thought.

The *Zhuangzi* is associated with a "Master Zhuang" who was probably an actual figure of the fourth century BCE, although not all of the text that bears his name is likely to have been authored by him. This text prescribes meditative practices as part of a program leading to one's transformation into a *zhenren* (perfected person) who is one with Dao, spontaneously (*zi-ran*) responsive to changing circumstances, and at peace with the prospect of loss and death. The text also celebrates other examples of human perfection known as *xian* (immortals) and *shengren* (sages). All of these figures are characterized by an acceptance of their places within a dynamic, ever-changing, and all-encompassing natural order. This sense of one's place in the cosmos contributed to the formation of culturally relativistic values and the idea that suffering could be transcended through abandoning one's ego. When Buddhism first entered China around

Lao Tzu on a water buffalo. (Foto Marburg/Art Resource, NY)

the first century CE, many Chinese converts to the new religion found parallels between Buddhist teachings and the teachings of the *Zhuangzi*. This led to the adoption of many terms found in the *Zhuangzi* for expressing Buddhist concepts in Chinese.

The *Laozi* is a fourth-century BCE collection of sayings attributed to a figure by the same

name who may or may not have existed. Its first 37 chapters are concerned with Dao, while the remaining 44 chapters focus on *de* (power, especially in the sense of personal charisma). For this reason, the text became known in the Han period as the *Daodejing* (*Classic of the Way and Power*), which also indicates that it had attained status as a culturally important text (*jing*) by this time. It describes Dao as ineffable and yet as something with which humans may enter into a harmonious relationship. This and other seemingly paradoxical views are common throughout the text, which asserts that “He who speaks does not know; he who knows does not speak” (*Laozi* 56). The key to attaining union with Dao is the practice of *wuwei*, a term that means “no action” but might best be understood as “effortless action.” Wuwei is a method of responding to one’s environment, both mentally and physically, that paradoxically achieves advantage and control through relinquishing them. It is a concept that underlies artistic techniques as well as many martial arts disciplines throughout East Asia. As in the *Zhuangzi*, here the sage who attains union with Dao concentrates his vital energy (*qi*), sees beyond conventional values, and is free from attachment to artificial distinctions such as good and evil, male and female, and beauty and ugliness.

While it might seem that Daoist philosophy is primarily concerned with evading the burdens of social responsibility and cultivating inner states of heightened awareness, these are only part of the tradition. Like its adversary, Confucian thought, Daoist philosophy was also concerned with government and social order. Unlike Confucians, Daoist thinkers worried little about the moral legitimacy of rulers and instead focused on practical pathways to gaining and keeping power. In this they looked for inspiration to their particular understanding of *Dao* and *Tian* (Heaven) as amoral and all-powerful tools that were opaque to conventional wisdom. The *Laozi* advises rulers to keep their subjects ignorant, well fed, and few in number so as to better control them and to keep themselves out of the public eye. The non-Daoist thinker Han Feizi (d. 237 BCE) incorporated these ideas into his *Fajia* (Legalist) theories, which later helped to form the basis of the Qin dynasty (221 BCE–206 BCE) poli-

cies. The *Guanzi*, which takes its name from Guan Zhong, a minister in the ancient state of Qi during the seventh century BCE, also discusses strategies of rulership in some detail. Finally, the aforementioned *Huang-Lao* texts describe how rulers can exploit the contemplative techniques found in the *Zhuangzi*, the *Neiye*, and the *Laozi* in order to impose order on the world and remain secure from threats to their power.

Multiple authors often living in different centuries wrote almost all of the works associated with Daoist philosophy. The term “Daoist” (*Daojia*) did not exist prior to the Han dynasty, and its application to pre-Han texts and traditions is somewhat controversial among scholars today. The proliferation of religious movements calling themselves Daoist during the Han and later periods further complicates our understanding of Daoism.

Mo Zi

Mo Zi (470–390 BCE) was one of the most important philosophers in ancient China. He lived in a time of great turbulence: the old feudal order centered in the Zhou royal house was falling apart as it confronted the challenges of the many regional powers. Endemic warfare prompted many princes to search for the best way to enrich their domain and strengthen their military, and their continuous search led to the blossoming of the so-called One Hundred Schools of Thought. Mo Zi’s teaching was one of these One

Hundred Schools, and he offered it as a remedy for the social ills at that time.

Mo Zi’s teaching, often known as Mohism, addresses many aspects of life, but a few salient points distinguish it from the others of the Hundred Schools. Characteristically, Mohism stands opposite to Confucianism on almost all important issues. The first is the concept of *jian-ai*, or “all-embracing care.” Contrary to Confucianism, which differentiates the care for parents from the care for strangers, Mohism advocates the same care for all. Once care is no longer graded, in Mo Zi’s view, competition will stop. The concept of *jian-ai* is closely related to another salience in Mohism: *feigong*, or nonaggression. Mo Zi denounced warfare and strongly urged for a stop to it. The concepts of *jian-ai* and *feigong* were at odds with most other schools of thought, for it was difficult not to give special care for one’s own kin, and it was impossible to simply lay down the weapons in times of rising violence. But these concepts represented the hope of most people of the time, who were often the victims of the rampant social disorder and thus were anxious to restore peace.

Mo Zi also strongly believed in gods and ghosts. This belief, too, sets Mohism apart from

➤ MO ZI THE ARTISAN

Mo Zi is best remembered as a philosopher, but he was also a great artisan. In fact, his career as an artisan provided a foundation for his logical thinking. Unlike most of his contemporary thinkers, Mo Zi came from the lower classes, and in his early years he worked as a craftsman practicing carpentry and engineering, which according to legend he perfected. Once he and his friend (another scholar) were playing a game in which they would attack and defend miniature walled cities, using wooden models. He designed numerous model weapons for this game, the most ingenious of which were mechanical birds and a so-called cloud ladder, a tall tower with wheels that could be used as a weapon to sack a walled city. Contemporary scholars speculate that the fact that Mo Zi’s teaching did not get government’s patronage could have slowed down scientific and technological developments in China.

—Yi Li

many other contemporary teachings. Throughout much of the Western Zhou era since the eleventh century BCE, high culture was characterized by its emphasis on secular humanism, a tradition of Confucianism. Confucius himself once stated that one must serve people before thinking about serving ghosts. It would be an exaggeration to say that Mo Zi is a believer, however, for the purpose of sacrificing for ghosts, according to him, could be quite pragmatic: as villagers worship together, the bond among them will be nourished. Pragmatism as an element of Mohism contrasts with Confucianism, while Confucius advises people with the sense of *yi*, or righteousness. Mo Zi believed that the most righteous thing to do is to ensure maximal benefit for the majority of the people.

Mo Zi's greatest contribution to the Chinese philosophy is perhaps his ideas about logic. He introduces two different paths of epistemological research: imitation and extension. Imitation is to use one thing to explain the other, an idea in agreement with another idea that is proven correct will be correct. Extension is to attribute the same to what is unknown as to what is known. In other words, if we know that water boils at 212 degrees Fahrenheit (100 degrees Celsius) here in the United States and that it does the same in Russia, we can extend this knowledge to China, assuming that water in China will boil, too, at 212°F (100°C). The methods of imitation and of extension are quite close to deduction and induction in Western logic. Mo Zi's epistemology is unique in his time and in China, and for that reason many people call him the first true Chinese philosopher.

Mohism, while once very popular, lost its appeal for much of the past two millennia since the unification of Qin. It is at least in part due to the First Emperor (r. 240–210 BCE), who destroyed most of the books that he thought would endanger his dynastic rule, and the emperor Wudi of Han (r. 147–87 BCE), who banished all other teachings in favor solely of Confucianism.

Legalist Thought

Legalism (sometimes also called Realism) was another school of thought in Eastern Zhou times, and in some important ways it was quite unique. In fact, it would probably be wrong to call Legalism a philosophy; it was more of a statecraft or *realpolitik*, a technique for keeping a ruler in power, his nation strong, and his population obedient and submissive. Legalism sought to accomplish these objectives through a simple recipe of rewards and punishments specified by laws. There was no abstract consideration of right and wrong; right was simply what the ruler wanted, and wrong was what he did not want.

Legalism was a straight-forward, anti-intellectual approach to governance. Legalists had very little patience for Confucian or Daoist ideas; for them, talk of *li* or *ren* or the *dao* was all mumbo jumbo and vain imagining. Legalists thought people were to be motivated not by any of these amorphous philosophical considerations, but by fear of punishment and longing for reward. Taking their cue from the Confucian philosopher Xunzi, Legalists insisted that humankind was stupid and predisposed toward evil. The followers of Xunzi soon parted company with Legalism when Legalists refused to believe in any possible perfectibility of human beings. (Xunzi taught that people could indeed overcome their innately evil natures.) Legalists insisted that people could not be reformed and had to be constantly controlled through laws specifying punishments and rewards for every conceivable behavior.

Legalists heartily disagreed with Confucianists and Daoists who harked back to a lost golden age. For many Legalists, there never was a golden age in the first place. They were out to create an ideal society and state here and now, for the first time in history. Some Legalists argued that, even if there had been a golden age in the past, it

would be impossible to restore or replicate it now because the times had changed drastically; yesterday's methods were incapable of solving today's problems.

Legalist thinkers formulated their ideas over two or three centuries. Various Legalist ideas and governmental techniques were eventually synthesized by a Legalist named Han Fei, who died in 233 BCE. His book, *Han Feizi (Master Han Fei)*, was a compendium of administrative technique, law, and criticisms of Confucianism, Daoism, and other minor schools of thought. The teachings of the book might well be characterized as ruthless and brutal. Han Fei spells out, among other things, his contention that the methods of the golden ages imagined by Confucians and Daoists were utterly inapplicable to the current situation. According to Han Fei, the Legalist ruler is not to be benevolent or loving in dealing with his subjects because this will only spoil and ruin them; people are motivated to act only by threat of force and by laws specifying rewards and punishments. Li Si, another Legalist who continued in this vein, urged the application of extremely harsh punishments for intellectuals who would not conform to the wishes and programs of the state.

Legalism was, then, completely amoral and highly unphilosophical. It eventually became the official ideology of the state of Qin, which defeated all other states and unified China under its rule in 221 BCE. It assumed that people could not be taught but only compelled or enticed. Legalist law was not natural law; that is, it did not claim to be modeled after the world of nature. Nor was it divine law, because it did not pretend to derive of divine sources or dispensations. Unabashedly manmade, it made no references to unchanging standards of right and wrong. People were recruited into government service not on the basis of their moral qualities or broad learning but their proven administrative expertise. Officials who accomplished what the government wanted were promoted and rewarded; those who did not were demoted and punished.

If Legalism can be called the rule of law, it certainly was not a democracy. Laws came from the whims of the ruler, not from the consent of the governed or the expressed popular will. Legalists

EXCERPT FROM *MASTER HAN FEI*

Han Fei, in his most famous passage, uses a parable to illustrate his point that the methods of the philosophers of the Golden Age were inapplicable to his times. He writes:

"If somebody in this present age should praise the ways of Yao and Shun . . . he would certainly be ridiculed by contemporary [Legalist] sages. Hence the sage does not seek to follow the ways of the ancients, nor does he regard precedents as the rule. He examines the circumstances of his own time and plans his course of action accordingly. There was once a man of Sung who tilled his field. In the midst of his field stood the stump of a tree, and one day a hare, running at full speed, bumped into the stump, broke its neck, and died. Thereupon the man left his plow and kept watch at the stump, hoping that he would get another hare. But he never caught another hare, and was only ridiculed by the people of Sung. Now those who try to rule the people of the present age with the conduct of government of the early kings are all doing exactly the same thing as that fellow who kept watch by the stump."

held a very dim view of their subjects; they could not trust a populace they regarded as stupid and self-serving to formulate their own laws. Daoists deplored this viewpoint because laws are in and of themselves indications that the government had lost its "way." Confucian scholars also found Legalism particularly revolting because the laws often seemed coldly arbitrary and did not accommodate any moral or ethical considerations. They concluded that the rule of law was not nearly as good as government by benevolent men who understood Confucian principles.

One Hundred Schools of Thought

“One Hundred Schools of Thought” (*baijia*) is a term used to describe the proliferation of multiple intellectual and spiritual movements in Warring States period (403–221 BCE) China. During this period the Chinese fought one another for mastery of the empire lost by the Western Zhou

dynasty (1100–771 BCE) to so-called barbarian invasions. Simultaneously, all of the major philosophical and religious traditions of China emerged, with the exception of Buddhism. While Hundred Schools thinkers disagreed intensely on nearly everything, they were in agreement on two points: (1) that the lost empire of the Zhou must be reunified under a single regime, and (2) that intellectual and spiritual pluralism was a sign of living in ill-fated times. Ironically, it was the profound cultural ferment of this era that later facilitated the emergence of a new imperial order and an accompanying intellectual synthesis.

The earliest of the Hundred Schools were the Confucians (*Rujia*), beginning with Kongzi, or Confucius (ca. 551–479 BCE), who came mostly from the ranks of the *shi* class and taught Zhou ceremony, literature, and lore to young men seeking success in public life. Kongzi and his followers, such as Mengzi, or Mencius (ca. 372–289 BCE), and Xunzi (ca. 310–220 BCE), taught that human beings are capable of moral perfection and that cultural formation through family life, ritual practice, and textual education is the key to achieving this perfection. They appropriated the term *Tian* (Heaven), which originally described the supreme deity worshipped by the Zhou kings, to describe a power that was morally good and brought all things into being but depended on human beings to put its will (which could be known by sages) into practice and thus did not always prevail on earth.

Followers of Mozi (ca. 480–390 BCE), now known as Mohists, rejected the Confucians’ aristocratic clannishness and antiquarianism. Instead, they argued for the intrinsic moral value of all human beings, whom one ought to “love universally” (*jian ai*), and saw *Tian* as an anthropomorphic deity whose will could be easily understood by humans and who never failed to reward goodness and punish wickedness. Later Mohists demonstrated an interest in logic that is unusual in Chinese intellectual history.

The term “Daoist” (*Daojia*) is frequently used to describe the thought expressed in texts such as the *Zhuangzi* (*Master Zhuang*) and the *Laozi* (*Master Lao*) or *Daodejing* (*The Classic of the Way and Power*). Although this term is anachronistic when applied to the Chinese thought before the Han dynasty (202 BCE–220 CE), it may

be used to describe those thinkers who rejected both Confucian and Mohist moralism and social planning because of their skepticism about moral judgments and suspicion of political idealism. These thinkers also demonstrated a much greater interest in contemplation and mysticism than is evident in Confucian or Mohist sources.

Daoist thinkers also were influenced by Hedonism and Legalism, two other Hundred Schools movements whose paths occasionally intersected with those of Daoism. Hedonism was personified by the legendary thinker Yang Zhu (ca. fourth century BCE), of whom it was said that he would not spare a hair from his own head even if it meant being able to save the entire world. Legalists, including Han Feizi (ca. 280–233 BCE), rejected the egoistic ethics of Yang Zhu, the meritocratic tendencies of the Mohists, the public-spirited moralism of the Confucians, and the mysticism of the Daoists in favor of a harshly mechanistic theory of law and punishment that was almost Machiavellian in its pragmatism and lust for power.

As the Warring States period drew to a close, a sixth school attained widespread influence, which would only increase in the new imperial eras just ahead. This was the Yin-Yang School (Yinyangjia) or Cosmologist movement, which claimed that all cosmic processes were deeply interconnected. This correlative cosmology implied that the smallest of human actions could affect cosmic processes and vice versa. Most Hundred Schools thinkers who accepted it used it to encourage rulers to behave in particular ways in order to exploit the cosmos for the benefit of the state.

Dark Learning

"Dark Learning" is an English translation of the Chinese phrase *xuanxue*, which also can be translated as "Abstruse Learning," "Mysterious Learning," or "Profound Learning" and is sometimes called "Neo-Daoism" by Western scholars. This term comes from chapter one of the *Laozi* (*Daodejing*, or the *Classic of the Way and Power*), which describes the *Dao* ("Way") as *xuan zhi you xuan* ("darker than dark"). It refers to a movement among Chinese thinkers during the third and fourth centuries CE that reinterpreted earlier Daoist texts in metaphysical terms. Xuanxue thinkers preserved and commented on these texts. These commentaries have influenced both Chinese and non-Chinese readers. Their works are best understood as a synthesis of Confucian (Rujia) and Daoist (Daojia) ideas.

Xuanxue thought emerged after the collapse of the Han dynasty (202 BCE–220 CE) when what we now call China split into three states: Wei in the north, Shu in the west, and Wu in the south and east. Each state competed with the others for supremacy, but all were plagued by continuous warfare and frequent floods and droughts. Chronic instability generated extraordinary intellectual and spiritual creativity. Educated elites looked beyond orthodox Confucianism, which had become the official Han ideology in 138 BCE, and explored alternative ways of thought. Some, such as the famous Seven Sages of the Bamboo Grove, abandoned Confucian values altogether. These sages met to drink wine, compose poetry, and talk but otherwise avoided social conventions and responsibilities. Others, however, retained their Confucian commitments to ritual propriety and social order. These included the most famous xuanxue thinkers, Wang Bi (226–249 CE) and Guo Xiang (d. 312 CE).

Wang Bi served as a minister in the state of Wei. Although he is most famous for his commentary on the fourth-century BCE text known as the *Laozi* (*Master Lao*) or *Daodejing*, he also wrote commentaries on the Confucian *Lunyu*

(*Analects*) and the ancient divination manual known as the *Yijing* (*Classic of Changes*). Wang was dismissive of the sectarian Daoist movements then emerging. These movements focused on attaining personal immortality and preached a millennialist message of impending doom and redemption through moral purification. Instead, he wished to identify the mysterious fundamental structure of the cosmos and apply it to the political and social renewal of his society. For Wang, this was the Dao, which he equated with a nonbeing that paradoxically brings all things into being and believed was beyond the capacity of human language to express. He argued that a true sage, like the Dao, rises above conventional understanding yet ensures that things happen as they should. Later, early Chinese Buddhists used his terminology to explain ideas imported from India to Chinese converts.

Guo Xiang served as a high-ranking official in the Western Jin dynasty (265–316 CE), which briefly reunified the territory formerly governed by the Han. He is best known for his commentary *Zhuangzi* (*Master Zhuang*), another fourth-century BCE Daoist text. Perhaps because of his focus on this text rather than the *Laozi* (*Daodejing*), his ideas differ significantly from those of Wang Bi. Guo Xiang rejected Wang Bi's notion of Dao as the nonbeing from which all things originate. Instead, Guo Xiang used the term *ziran* (spontaneity or naturalness), a central idea in the *Zhuangzi*, to argue that nonbeing is an illusion and that only being exists. This originates and transforms itself without any external force becoming involved. His metaphysical view of the cosmos as self-creating, self-changing, and self-sustaining led to his ethical view that one should be content in all circumstances, accepting change as the way (Dao) of the universe.

Buddhism Comes to China

Buddhism first gained a foothold in China during the Three Kingdoms period (220–280 CE). It came in not directly from India but from central Asian Buddhist kingdoms that had converted to Buddhism a few centuries earlier. (Some of these kingdoms had originally been founded by the generals of Alexander the Great, and later their populations converted to Buddhism, thus combining Buddhist religion with Greek culture.)

Buddhism had been known in China since Han times, but it never flourished during that dynasty. This is probably because the basic message of Buddhism, that life is suffering, did not resonate with the Han Chinese. Life was fairly good in Han China, and the majority of Chinese seem to have had little if any desire to alleviate the pain of life with a palliative religion.

One variety of the religion called Mahayana Buddhism taught that because strictly abiding by Buddhist practices (such as the Eightfold Path) was an extremely difficult or even almost impossible thing to do, merciful beings called *bodhisattvas* who had achieved nirvana themselves had, at the time of their deaths and on the brink of stepping into eternal nirvana, stepped back and turned their compassion and attention to the mortal, suffering world. By having come this close to eternal nirvana and then temporarily backing away from it for the sake of the world, they had accrued to themselves an inexhaustible fund of merit which could be imputed to all people who turned to them in faith and supplication.

Mahayana Buddhism was, then, a type of savior religion, and it appealed deeply to the Chinese of the Period of Division. Life in China at this time was rough and entailed much suffering. Buddhism had great appeal in both northern and southern China, among the elite and commoners alike. The rulers of the barbarian

► UNDERSTANDING BUDDHISM IN CHINA

Some Chinese Buddhists were so interested in the religion that they became monks and traveled all the way to India, the land of Buddhism's origins. There some of them even mastered the extremely difficult Sanskrit language in which Buddhist *sutras* (religious writings) were written and translated them into Chinese. Eventually, Buddhism in China took its own peculiar doctrinal turns. The Chan ("Zen" in Japanese) school of the religion became the most well known of these. During the first wave of Buddhism's entry into China, the Buddhist missionaries and early Chinese converts used Daoist terminology to translate Buddhist terms.

This, however, led to conceptual confusion and created misunderstandings. Most Buddhists in China eventually decided to transliterate, rather than translate, Buddhist terms in their full foreignness. That is, they decided not to translate the terms at all, but more or less to spell them out exactly as they sounded in Sanskrit. Many Buddhist terms thus had a very foreign ring to Chinese ears, but this actually added to their mystery and reinforced the point that they were indeed different from Daoist ideas and concepts.

—David Curtis Wright

conquest dynasties in northern China found the religion attractive precisely because it was not Chinese and because it had come from another great and ancient civilization. But the elite of the native Chinese dynasties in southern China also found Buddhism acceptable because of its art, its more advanced teachings, and its message of possible surcease from suffering. Commoners in both northern and southern China accepted Buddhism because of its message and the beautiful and colorful art the Buddhist missionaries used to explain the fundamentals of the religion. By the 500s, China had been thoroughly converted to Buddhism.

Buddhism fit nicely into the Confucianist-Daoist duo and transformed it into a religious and philosophical trio. The Chinese during this time concluded that Confucianism was applicable to governmental affairs, while Buddhism and Daoism pertained more to an individual's private, inner religious life. But Confucianism during this time seemed somewhat irrelevant because there was no effective central government in China that could seek to apply it. Buddhism and Daoism gave people much more solace and comfort in their lives, and most Chinese, and even many Chinese emperors, more or less preferred it over Confucianism. The Period of Division and the Sui and Tang dynasties that followed it were the heyday of Buddhism in Chinese history.

The Debate between Buddhists and Greek Philosophers at Meandner's Court

Meandner, also known as Menander, is one of Alexander's Indo-Greek successors who ruled the Bactrian kingdom in northwestern India around 150 BCE and was a patron of Buddhism, according to both Pali and Chinese literary traditions. The very existence of King Meandner is attested by the large amount of coins bearing the inscription "Saviour King Menander" in Greek on the front, found from modern Kabul to Punjab. Some of the coins of Menander I and Menander II incorporate the Buddhist symbol of the eight-spoked wheel, associated with the Greek symbols of

victory. According to Buddhist literature, the great Indian Buddhist emperor Asoka sent Buddhist emissaries to the Greek lands in Asia to spread the dharma toward the end of third century BCE. Thus, the Buddhist presence in Greek Bactria during the second century BCE and the debates on certain important Buddhist doctrines between King Menander I and a Buddhist monk named Nagasena are presented in a number of different works, translations of texts that may have originally been written in Sanskrit as early as 100 BCE.

These debates are preserved in the *Nagasena Bhikṣu Sutra* in Chinese translation and the *Milindapaṇḥa* in the Pali language, which is only used by the Buddhists in South and Southeast Asia. The first work is only one-fourth of the second in length and corresponds to the first part from pages 1 to 89, at the end of which there is a concluding sentence saying, “Here ends the answering of the problems of the questions of Milinda.” Comparative studies show that both works may come down from one original version and that the Chinese translation is earlier than the Pali one. Some technical terms in the earliest Chinese translation of the *Nagasena Bhikṣu Sutra* highly suggest that it was translated during the second century CE. Thus, the original work must have been composed much earlier.

The debates between the king and the Buddhist monk mainly concentrate on some of the important Buddhist concepts such as no-soul, rebirth, karma, Buddha, nirvana, and spiritual life. It suggests that the king had little knowledge of Buddhism but had difficulty in understanding some major teachings, particularly the concepts of no-soul and rebirth. As a result, Nagasena used as many as six similes to illustrate the point. The following is a dialogue on no-soul theory to show the nature of their debate:

“Suppose a man, O king, were to light a lamp, would it burn the night through?”

“Yes, it might do so.”

“Now, is it the same flame that burns in the first watch of the night, Sir, and in the second?”

“No.”

“Or the same that burns in the second watch and in the third?”

“No.”

“Then is there one lamp in the first watch, and another in the second, and another in the third?”

“No. The light comes from the same lamp all the night through.”

“Just so, O king, is the continuity of a person or thing maintained. One comes into being, another passes away; and the rebirth is, as it were, simultaneous. Thus neither as the same nor as another does a man go on to the last phase of his self-consciousness.”

Religious Developments in Yayoi Japan

The Yayoi period (ca. 400 BCE–ca. 250 CE) is named after a district of Tokyo where the first pottery from this period was discovered. However, the original home of Yayoi culture in Japan was in northern Kyushu and is distinct from the earlier Jomon culture in more than just pottery. Yayoi technology was more advanced than that of Jomon and included the use of the potter's wheel as well as metalwork in bronze and later in iron. What makes Yayoi most distinctive, however, was that it is identified with the beginnings of settled agriculture and especially of wet rice cultivation. This allowed for the development of more complex societies and for the development of a different approach to religion.

Evidence indicates that Jomon religion involved fertility practices, but scholars do not know much more about it. Yayoi religion centered on agriculture and on the religious importance of social hierarchies. Yayoi religion is therefore seen as the origin of modern Japanese Shinto in both its folk forms and in the more el-

evated ceremonies connected to the Japanese imperial household. Though often seen as “nature religion,” Shinto has an intimate connection with the agricultural cycle and especially with the planting and harvesting of wet rice. In developing agriculture and wet rice cultivation, Yayoi culture made these central aspects of the religious arena as well. Their development of bronze work led to the creation of ceremonial articles such as bells, jewelry, mirrors, and swords, which had both religious and political significance. The “Three Sacred Treasures” (a sword, a mirror, and a necklace of jewels) are still presented to each successive Japanese emperor during his enthronement ceremony. Scholars do not know if these are originals since outsiders have never seen them; they represent continuity with the Yayoi culture and its religion.

In Yayoi culture, the centrality of wet rice cultivation was linked to the centrality of their rulers. These rulers were to develop in a later period into the Japanese emperors. Both the sacred treasures and rice are viewed as the gift of the gods. Rice cultivation requires cooperation and regulation, which indicates the existence of a complex society. The Yayoi rulers were responsible for organizing this society. Religious developments meant that these rulers were seen as both human and divine. Their existence guaranteed the goodwill of the gods, the continuance of society, and the guarantee of the harvest. Initially, Yayoi culture was decentralized with a number of different settlements and (presumably) a number of different rulers. This only developed into a unified imperial system after the end of the Yayoi period in the later Kofun or Yamato period. However, religious developments in the Yayoi period were the essential prerequisites for this happening. At a more popular level, religious developments in this period also laid the foundation for popular or folk Shinto. Based around the agricultural cycle, Shinto is particularly focused on rice and products made from it. This overwhelming emphasis on the importance and even “sacred” nature of rice remains a feature of Japanese society.

—Michael Thompson

➤ HANIWA

Haniwa are baked red clay figures of different sizes that were placed in the tombs of important people beginning in the late Yayoi period. Haniwa can look like people, especially soldiers, but there are many other designs as well. They can be horses, birds, or houses. It is not clear why they were made. This practice may have replaced earlier customs of putting real offerings in graves. The custom may reflect a belief in an afterlife in which these things would be of use. The figurines may also have been symbols of respect and/or displays of power.

Religious Development in Early Three Kingdom Korea

The Three Kingdoms period (from the first through sixth centuries CE) witnessed two major developments in the religious history of Korea. The first was the integration of the native belief system into the cult of the royalty. Rulers of the three rival states of Koguryo, Paekche, and Silla claimed to possess supranormal or shamanic powers in order to sacralize their genealogy and distinguish themselves from the other contenders for kingship. The second was the spread of Buddhism in the late fourth century, which had immediate political, social, and spiritual repercussions.

The Koguryo legend of the founding ruler, Chumong, in which he is described as the “Grandson of the Emperor of Heaven” or “the descendant of Heaven itself” apparently evolved into a model for state rituals. According to Chinese

historical annals, to the east of the capital of Koguryo there was a huge cave called the cave of the Underground passage where people welcomed the return of the spirit of the cave in the tenth month. Historians believe that the cave represented resurrection or fertility ceremony and was dedicated to the mother of the founding ruler, Chumong-Tongmyong. The cult of Tongmyong also became the state religion, which the people of Koguryo observed apparently as an expression of gratitude for their happiness and prayer for continued prosperity.

The rulers of Silla also developed a state ritual centered on Pak Hyokkose, the mythical ancestor, in a bid to define and justify their claim to a sacred and superior genealogy and the attendant reinforcement of political authority. All the Silla rulers carried out sacrificial rites at the shrine of Hyokkose either in the year of their ascension to power or in the following year in spring. Sacrificial ceremonies were usually accompanied with discussions on important state matters. Decisions that were arrived at were considered to be sacrosanct for both the ruling elite and commoners, apparently because it was felt that the political process of the states had now received supernatural imprimatur. However, from the late fourth to sixth centuries BCE when these three ancient states developed a fully agricultural society and underwent the related process of state formation, they drew on Chinese ideas and institutions. The model of the Northern (Chinese) dynasty that successfully harnessed Buddhism as an instrument of the state represented to Koguryo, the first Korean state to accept Buddhism, an ideal system of centralized monarchical state.

Buddhism was first introduced to Koguryo by the monk Sundo from Former Qin who was sent by Fujian and brought a Buddha image and Buddhist sutras. Since Fujian was in close contact with events on the Korean peninsula after his conquest of Liaodong in 370 CE, his role in spreading Buddhism to the Korean peninsula appears to be related with his broader political and diplomatic objectives. Koguryo rulers were clearly impressed by the Chinese cultural package, the coherent ensemble of Buddhist motifs and the mechanism of Confucian statecraft. This explains why Koguryo established a Confucian

Academy in the same year (372 CE) it patronized Buddhism as the spiritual mainstay of the state. Subsequently, Koguryo also imported Daoism. Prime Minister Yon Kaesomun told King Pojang in 643 CE, “None of the three teachings (Buddhism, Confucianism and Daoism) should be neglected, as each one of them constitutes the leg of a tripod.” He requested that the king send an envoy to the Tang to learn Daoism and to spread this religion in the state. Consequently, in the following year eight Daoist monks came from Tang China. They were accommodated in Buddhist monasteries.

Paekche was introduced to Buddhism in 384 CE when a monk called Marananda came to this state from Eastern Jin. Since Paekche was the most formidable enemy of Koguryo in the late fourth century and Koguryo and Former Qin were close allies, it is very likely that this state sought to build strong ties with Eastern Jin, the enemy of Former Qin. King Asin (392–405 CE) in his edict exhorted people to embrace Buddhism and seek blessings. The recently discovered tomb of King Muryong (501–523 CE) provides evidence of distinct Buddhist influence. King Song (523–554 CE) made singular contributions to the cause of Buddhism. It was during his reign that Buddhism was introduced to Japan, where the ambitious Soga clan used it in order to consolidate its power at court.

Buddhism was accepted as the guiding ideology of Silla in 527 CE during the reign of King Pophung. His successor, King Chinhung, sought to exploit the possibilities that the Buddhist concept of cakravartin, or a cosmic sovereign, held for reinforcing his aggressive monarchical career and legitimating his political imagination of peninsular conquest. He invoked the Buddhist concept of supreme kingship by naming his sons Tongnyun (Bronze Wheel) and Saryun (Iron Wheel) two of the four kinds of cakravartin (Universal Ruler). King Chinhung is generally believed to be the Korean Asoka, presumably because, like Asoka, he extended patronage to Buddhism and inaugurated an epoch of great vitality in Korean history. One of his major achievements was the reorganization of the Hwarang based upon the new Buddhist-Confucian ideas. The Hwarang order represented a quest for equivalence between indigenous values and im-

ported ideology. Buddhism as a spiritual foundation of the state emerged as a powerful force of unity in Silla and contributed to the erosion of the ideological anchorage of the traditionalists at court and provided unity and identity to the Silla society.

Another Silla ruler, King Chinp'yong (580–632 CE), named himself Chongban (Suddhodana) and called his wife Maya Puin (Maya Devi). The king's two brothers were also named after the two brothers of Suddhodana, Suklodana and Dronodana, signifying a special linkage between the royal lineage of Silla and the lineage of Sakyamuni. Employment of this Buddhist rhetoric served to reinforce the sacred character of Silla kingship.

During the reign of Queen Sondok, the twenty-seventh monarch of Silla, Buddhist myth was invoked once again. The Buddhist world of the times proclaimed her to be a queen of the

Ksatriya caste, the warrior caste of India to which the Buddha belonged. It thus accorded her a status crowned with virtue and valor. The monk Chajang also proclaimed Silla as a Buddhist realm and an abode of past Buddhas to give spiritual comfort to his countrymen and to instill in their minds confidence and a sense of pride.

■ Introduction: New Religious Lifestyles

From 1000 BCE to 300 CE, a number of new lifestyles based on religious beliefs developed. Prior to this, most religious systems emphasized the role of religious specialists. Especially prominent in the Near East and the Greek world, these priests were in charge of organizing worship and offering sacrifices much in the way that state employees were in charge of running various types of infrastructure. This approach to religious life continued through 1000 BCE to 300 CE (especially in the Near East and the Greco-Roman world), but new lifestyles in which the individual could participate in religious life appeared as well.

These new lifestyles are most readily apparent in the religious traditions that appeared on the margins of society. The early Christian Church remained a marginalized religious institution for most of this period, and its followers developed an elaborate church hierarchy outside of the normative society of ancient Rome. With Christianity, the idea of martyrdom also developed; that people should sacrifice themselves in taking a stand for

their religious beliefs was utterly novel. Christianity itself emerged as a new tradition in the context of other Judaic traditions that developed as alternatives to mainstream Judaism, as organized by the Temple in Jerusalem. Other marginalized traditions in Roman society include the so-called Mysteries in which devotees sought direct and often ecstatic encounters directly with the divine forces, very different from the formal and indirect temple worship of the Roman state. The nature of these mystery religions varied dramatically, and some of the more ecstatic traditions were banned in different periods in Roman history.

While these marginal religious lifestyles were practiced by people still participating in Roman society, a new type of lifestyle that involved withdrawing from society also emerged in the Roman world and within Buddhism. This is the time of the first monasteries, where individuals would step out of the normative practices of everyday life in order to devote themselves to a more spiritual life.

—Kevin M. McGeough

Jewish Essenes and Messianic Movements

In the centuries around the birth of Jesus there were several messianic movements in Palestine. One of these movements was the Essenes, an ascetic and esoteric Jewish sect that lived a communal and celibate life in the Judean desert at Qumran. During the third century BCE the unceasing Hellenization of the Jews represented a grave threat to their very survival as a race and monotheistic religion. In response to this colonization by the Seleucid empire, three Hasidean Jewish sects emerged: the Pharisees (rabbis), the Sadducees (aristocracy), and the Essenes. Contemporary sources relate that the appellation “Essene” means “holy ones” and also “healers,” although the Essenes referred to themselves as the Community of the Poor and the Sons of Light.

The Essene community flourished at Qumran (located on an escarpment at the northwestern tip of the Dead Sea approximately 20 miles or 32 kilometers east of Jerusalem) in the second and first centuries BCE until the first century CE. The site was razed in 68 CE by the Romans during the First Jewish Revolt. But before the site’s destruction, the sect hid their sacred scriptures in nearby caves, where they remained hidden until found in 1947 by a Bedouin shepherd. These scriptures consist of both biblical and sectarian scrolls and have come to be called the Dead Sea Scrolls. Archaeologists at the Qumran

site have uncovered numerous ritual baths (*mikvehs*), a communal dining hall, and a scriptorium for the copying of the scrolls.

The most celebrated Essene leader was the Righteous Teacher, the founder of the sect. Their sectarian scrolls describe his battle with the Wicked Priest (Temple high priest) over Temple cult practices. Since the Essenes practiced both a stricter adherence to Jewish law and a stricter observance of the Sabbath, they sought to separate themselves from the two other main sects within Judaism. They established a desert community in order to prepare for a Holy War against the Sons of Darkness (all nonbelievers, including other Jews) that was to take place at the end of days. The sect was awaiting the coming of two Messiahs, the priestly Messiah (Messiah of Aaron) and the royal Messiah (Messiah of Israel); the Essenes believed that both would appear during the current generation. This has led many modern scholars to characterize the Essenes as having practiced a priestly apocalypticism.

In addition to their practice of a communal life of celibacy and rejection of family members, the Essenes preached personal poverty. This required all candidates, each of whom had to pass through a two-year novitiate before being granted full membership, to sell all personal property and give the proceeds to the order to be held in common and doled out according to need.

Perhaps the most important tenet of the Essenes was their observance of the daily communal meal, during which members partook of a ceremonial meal of bread and wine. In order to maintain ritual purity, before each meal members had to bathe in a ritual bath and then don sacral garments of white linen. Indeed, the maintenance of ritual purity was of paramount importance since the communal meal was always performed in anticipation of the messianic banquet, which would usher them into the kingdom of God. In the final analysis, Essene doctrine and practice influenced early Christianity.

—Keith D. Sisson

THE DEAD SEA SCROLLS

Ever since their initial discovery in 1947 by a Bedouin shepherd in a cave near Qumran, the Dead Sea Scrolls have shed light on Essene doctrine and practice. In the decade that followed, more scrolls were discovered in nearby caves. The biblical scrolls contain all 24 books of the Hebrew Bible except Esther; the sectarian scrolls include the Damascus Document, the War Scroll, the Manual of Discipline, and the enigmatic Copper Scroll. The Copper Scroll is perhaps the most intriguing since it both lists the contents and reveals cryptically the whereabouts of hidden treasures that have yet to be found.

Christian Life in a Pagan World

Many religious currents were active in the late Roman era: the imperial cult, the mystery religions, Judaism, Gnostic groups, and many others. The Christian Church formed its identity both in contrast to these other orientations as well as through internal splits. Even during the 300 years of sporadic persecution within the pagan world of the Roman empire, the Christian religion expanded. In the pagan world of Emperor Claudius (41–54 CE), Christians were still considered part of the Jewish community; however, by the end of the first century both sides (Jewish and Christian) were separately persecuted by Emperor Domitian. The year 312 CE marked a turning point, as Emperor Constantine magically ascribed his victory over Maxentius to the Christian God. From this point on, Constantine promoted Christianity and prohibited the pagan cults.

Immediately after the death of Jesus, early Christian communities were still indebted to the Jewish tradition. The first adherents were either Jews or individuals interested in Judaism. A dispute in Antioch initiated the first split between the Christian and Jewish religions. Conflict erupted when conservative Christians from the Jerusalem congregation insisted on Jewish circumcision as a precondition to being a Christian. The solution, reached at the council in the year 48 CE, was that being uncircumcised should not bar one from becoming a Christian. Religious initiation was not connected to privileges or preconditions. This made it very attractive to people of both sexes among the middle and lower classes.

Christianity spread in the first decades through the work of charismatic mobile individuals and wandering prophets, both male and female. Christians communicated their values and way of life to the public with direct person-to-person contact. This method engaged both working people and members of the upper class. Tradition holds that even prisoners spread the message of Christianity. Later Christians, such as

▶ PLINY THE YOUNGER AND REPORTS OF CHRISTIAN ATROCITIES

Roman administrative practices toward Christians are preserved to some extent in Pliny the Younger's *Epistulae* (letters). Pliny (61–ca. 122 CE) was sent to Asia Minor by Emperor Trajan. Pliny reported in the year 112 CE about the problem of the growing number of Christians in the province of Bithynia et Pontus. Pliny investigated accusations of atrocities that he subsequently deemed unfounded. On the contrary, in his letter to Rome he described the Christian cult as having exemplary ethical goals. Emperor Trajan responded to this by stating that those who converted to Christianity should be punished by death. Those who were accused of being Christians were obliged to perform a public worship act to prove that this was not the case. The accused Christians were expected to perform a sacrifice to the gods and to the emperor (in his role as a god). In this public act, they were also expected to denounce Christ.

—Barbara Wilhelmi

Ulfilas (Wulfila), bishop of the Goths (ca. 310–383 CE), claimed that Christian ancestors had once been prisoners. For the first three centuries of the Common Era, unpaid healings by the laying on of hands and prayer were significant means through which Christianity was spread. Justin (ca. 100–165 CE) and Tertullian (ca. 160–220 CE) brought these early Christian healing successes to the Roman empire, where community members demanded them as a form of social care when pagan magi and pharmacologists failed or were too expensive.

The Christian communities in Roman cities met in private houses. Houses were meeting places for a variety of reasons. First, Christians were initially not very numerous, and in times of persecution private houses were safer. Hence, we can imagine that women often hosted these private house-based meetings. The metaphor of the “house of god” implied a criticism of the emperor, who as head of his empire (house) was understood to be the *paterfamilias* (father of the family) and who demanded total loyalty. Exclusive meetings in houses countered this total loyalty.

The communion of the holy (*communio sanctorum*) was the central point of this community. This is where intensive prayer took place and the Eucharist was celebrated. The ritual of baptism was the foundation of the community and was a central component of belief. Contributions were gathered in the collection for social causes according to means. Many women are depicted taking part in evening communion in the frescos in the catacombs (e.g., in the Priscilla catacomb). This is evidence of the leading role of women in community life until the fourth century. The oldest person led. As Christianity became more established, women were only allowed to occupy the hierarchically less important offices. In some of the later letters of the Bible (such as Ephesians), guidelines for conventional Christian conduct are established.

Christians were persecuted in a variety of ways in the first 300 years. Nero persecuted them within the city of Rome in the year 64 CE, and the entire Roman empire was dangerous for them under Domitian (81–96 CE) and Trajan. There was also brutal torture by imperial order for several decades under the emperors Decius, Valerian, and Diocletian. Simply being a Christian was a punishable offense.

There was an abundance of accusations against Christianity, many based on the fact that this was a new movement that originated in the east. In part, Christians inherited the accusations that had previously been made against the Jewish community: they were an exclusive community with foreign customs and secret practices, and they did not take part either in public life or in Roman religious rites. Not participating in pagan religious practices was considered economically damaging because cultic practices permeated many industries. Butchers, construction workers, and fortune-tellers, for example, made their living by selling religious products or services. This livelihood was threatened when groups within the community refused to participate in those religious practices.

The Christian message encouraged individuals to guide their personal lives with moral principles, which could lead to unwavering refusal (*obstinato*) in trials against them. Christians also rejected pagan myths, in the form of either plays, educational content, or sculpture. Tertul-

lian warned about taking part in the athletic games due to their mythological content. In the *Traditio Apostolica* from the early third century we learn that painters, dancers, actors, and innkeepers could be refused baptism. From a Christian perspective, all of these professions were undesirable due to their association with the organization of pagan feasts.

The profession of faith, originally a part of baptism, acquired a new significance in the trials against Christians. Anyone who bore witness to the Christian faith, by definition a martyr (Greek: witness), had to also suffer martyrdom, which now meant sacrificing one's life. Tertullian wrote of martyrdom as a cure for a sick, sinful life. Men and women differed in this regard in one crucial way: most female martyrs bore witness to their Christian faith by opting for a life of virginity, which was promoted by Paul in particular. A woman's refusal to marry was understood by the patriarchal society as a refusal of submission and was punished. Christ's successors valued Christianity above family relationships, as the reports about the martyrs Felicitas and Perpetua make clear. The traumata suffered were developed as legends in countless literary retellings in later centuries. We cannot prove whether all of these martyrs sacrificed their lives as readily as is reported. The ideal of being a successor to Jesus and an ascetic outlook certainly contributed to this. Persecution was seen as a test of faith, with death as a victory. There are also connections between sacrifice of life and the mystery religions, which also presuppose a life after death. Hence, the myth of Proserpina (Persephone) tells of voluntary entry into death.

Women in Early Christian Communities

The role of women in the early Church underwent significant change as Christianity spread throughout the Roman empire. Initially, women were afforded prominent positions, but by the solidification of the church hierarchy in the fourth century CE, their roles within the church had been restricted.

In first-century CE Christian writings, women are often mentioned as disciples. The Gospels portray several women positively, noting that they were admirable believers and provided hospitality to traveling Christians. The Pauline letters likewise mention numerous women who were actively involved in the early Church, many as missionaries. Women participated openly in Christian life, praying and prophesying as well as serving as church leaders. There is evidence that some early Christian communities applied Galatians 3:28 to their communal structures and thus emphasized gender equality in regard to religious practice. In communities that did not stress traditional gender roles, women were allowed a high degree of autonomy.

From the second century CE onward, the role of women in the church began to change as theologians applied passages such as 1 Corinthians 11:2 to roles within the church. Furthermore, when local power began to solidify in the figure of the bishop, who was always male, the role of women within the church became more rigidly structured. Women turned to other avenues to express their religious devotion. In particular, with the rise of asceticism and the

Mary Magdalene sees the apparition of the risen Jesus Christ, in this woodcut from about 1500 CE. (Jupiterimages)

monastic movement of the fourth century CE, many women were freed from assuming traditional obligations such as marriage and child-bearing. Wealthy women in this period also became patrons of the church, lavishing donations of land and money on it or offering support to individuals. Melania the Elder, for instance, provided ample aid to the Christian scholar Jerome (ca. 400 CE), even providing the funds to build and sustain his monastery in Bethlehem.

Within early Christianity there were clearly differing opinions about the role of women within the church. While some authors such as Tertullian railed against women serving as deacons, there was a large corpus of noncanonical literature that focused on positive aspects of religious women. The popular prison diary of Perpetua, a third-century CE martyr, details the devotion and courage of a young woman in prison awaiting her execution in the arena. Perpetua gave up her familial ties, including her newborn son, in order to devote herself to her faith. The *Acts of Paul and Thecla* describes the encounter between a young Roman woman, Thecla, and the apostle Paul. Thecla goes on to become a powerful leader in the church with the power to baptize and exorcise demons. The story stresses the opposition that Thecla encountered

➤ MARY MAGDALENE

Mary Magdalene is one of the most studied women in early Christian history. She makes her first appearance in New Testament writings as a follower of Jesus. She is described as a teacher, a recipient of visions, and one of the first witnesses of the resurrection. She appears in numerous other noncanonical texts as a prominent leader in the early Church, most notably in the gospel of Mary. This depicts Mary as the preeminent disciple of Jesus. In this work, she even gives instructions to other followers. Beginning in the fourth century, however, theologians began to associate Mary with the unnamed sinner women in Luke 7:36. She was thus subsequently connected to all sinful women who appear in the New Testament, especially the prostitute mentioned in John 8:1. Mary was gradually transformed from a powerful holy woman into a repentant prostitute.

—Lisa Holliday

as she rose to prominence and has often been interpreted as an argument for increased power for women within the church.

By the fourth century CE, women did not serve in church administration but were more commonly associated with the church's charitable endeavors and monastic movement. Therefore, although women's roles changed in this period, women remained influential members of the early Christian community.

Development of a Christian Hierarchy

The teachings of Jesus put forth an ideal of servant leadership. One gospel, Matthew, singles out Peter for a special role (Matthew 16:18), but

it is clear from the New Testament that Peter did not actually exercise centralized authority over the early Christian movement. The canonical gospels and Paul's letters mention a core group of 12 disciples who played a role carrying on Jesus's authority and who will act to judge the 12 tribes of Israel during the end times (Matthew 19:28; Mark 3:13–19). These 12, however, were not the only ones to exercise leadership in the early Christian movement. Jesus's brother James and the apostle Paul were the two most prominent leaders who had not been among the 12. Neither is it clear exactly who all of the 12 were or what sorts of leadership, if any, each one exercised after Jesus's death.

Leadership in the early Christian movement could be based on numerous factors including a blood relationship with Jesus (James), close association with Jesus (Peter, John, and perhaps Mary Magdalene), charismatic authority (Paul, Prisca, and Aquila), or some combination of these. In Paul's letters, a number of people, including many women, appear to be founding and presiding over Christian communities (see Romans 16). There was no regularized ordination process acknowledged by all Christians in the early decades. Christian leaders such as Paul arose spontaneously in this spirit-filled environment. Gradually a new and more stable leadership structure began to develop in which deacons (servants) constituted the lowest rung followed by presbyters (elders) and bishops (overseers). Soon these came to be seen as offices with specific requirements (1 Timothy 3). A first-century text called the *Didache* is witness to a time when itinerant charismatic prophets coexisted with a more established hierarchy, each having their own type of authority. Gradually the hierarchical model became dominant, and further developments took place in the second century as women came to be excluded from church offices, mirroring the practice of many other social organizations in the Greco-Roman world. One bishop began to exercise authority over the churches of a particular area as the proto-orthodox catholic form of Christianity tried to consolidate its position and decide which ideas were acceptable and which were to be considered heretical. When a bishop died or was martyred, a new bishop was elected from within the community.

► DIDACHE 11:8–12 AND 15:1

The *Didache* (Teaching of the Twelve Apostles) is a text likely written in the first century CE. The *Didache* thus serves as an interesting historical record that documents the beliefs, practices, and organization of an early transitional Jewish-Christian community prior to the development and institutionalization of a church hierarchy. The following passage attests to the multiple forms of leadership and authority that characterized early Christianity.

“Not everybody making ecstatic utterances is a prophet, but only if he behaves like the Lord. It is by their conduct that the false prophet and the [true] prophet can be distinguished. . . . If someone says in the spirit, “Give me money, or something

else,” you must not heed him. However, if he tells you to give for others in need, no one must condemn him. . . . You must, then, elect for yourselves bishops and deacons, who are a credit to the Lord, men who are gentle, generous, faithful, and well tried. For their ministry to you is identical with that of the prophets and teachers.”

—Jeffrey Trumbower

Source

Didache 11:8–12 and 15:1 in *Early Christian Fathers*, edited by Cyril Richardson, Library of Christian Classics Series (Philadelphia: Westminster John Knox, 1970), 176 and 178.

In the early third century we find the first attestations of the terms “hiereus” (Greek) and “sacerdos” (Latin) applied to Christian presbyters and bishops. These terms mean “priest” and connote a connection to the temple priesthood in the Hebrew Bible. Earlier writers had described all Christians as priests (1 Peter 2:5–9), but in the third century this term came to denote only those who performed the Eucharistic ceremony, understood as a reenactment of Jesus’s sacrifice.

Many cities around the Roman empire had influential bishops in the third and fourth centuries including Jerusalem, Alexandria, Antioch, Ephesus, and Rome. Often these bishops were called “papa” (father), a term of endearment and recognition of authority. Although the bishop in Rome eventually became known as the pope and assumed the primary position of leadership in the Catholic world, at the close of this period (300 CE) the Christian hierarchy remained in its formative stage.

Development of Buddhist Monasteries

The Buddhist *sangha* (community) included monks (*bhikkhu*) and nuns (*bhikkhuni*), though sometimes the term “sangha” includes dedicated lay followers as well. The rules governing the behavior of monks and nuns evolved during the Buddha’s lifetime, and during the century after the Buddha’s death (ca. 400 BCE), they were collected and codified in what is called the *Vinaya-pitaka*, the “Basket of Monastic Rules.” The *Vinaya* is one of the three principal divisions of early Buddhist scripture, the other two being “baskets” that contain, respectively, the Buddha’s sermons (the *Sutta-pitaka*) and early Buddhist philosophy (the *Abhidhamma-pitaka*).

The heart of the *Vinaya* is the list of rules called the *Patimokkha* (227 rules in the

UPOSATHA CEREMONY

“Venerable ones, I have just recited this set of rules. I ask you, in the name of the Community, whether you have transgressed these rules. [He would repeat the question three times, and then continue.] Venerable ones, I infer from your silence, in the name of the Community, that you have not transgressed these rules.” [Uposatha ceremony described and cited by Mohan Wijayaratna]

Mohan Wijayaratna, *Buddhist Monastic Life According to the Texts of the Theravāda Tradition*, translated by Claude Grangier and Steven Collins (New York: Cambridge University Press, 1990), 124.

Theravada *Vinaya*, with more for nuns), which monks gather to recite every lunar half-month in what is called the *uposatha* ceremony. After the recitation, the most senior monk asks for confessions of any offenses. It is considered a palpable benefit to one’s practice to confess and a great hindrance to refrain from doing so.

The additional stringent rules for nuns suggest that the Buddha may have wished to preclude the charge that women were joining his community simply to escape their family responsibilities. Even so, he is recorded as having prophesied that the order would only last half as long with nuns present. Perhaps he doubted that enough supporters could be found to contribute to the oddity of a mixed-gender sangha.

Monks and nuns renounced their homes and familial obligations and adopted a life of celibacy, few possessions, and a daily round of begging for food. Monks were required to accept without comment whatever food was offered to

them, for which reason the Buddha did not prohibit the eating of meat.

Much of the early community often accompanied the Buddha in his travels around northern India, and he tended not to stay in any location for more than a few weeks, often less. However, after the Buddha instituted the rule of the rains retreat, during which monks and nuns were required to stop their wandering for four months of each year, the first permanent monasteries—whether freestanding structures (*viharas*) or excavated caves (*gubas*)—became appropriate and beneficial. Prominent rulers and wealthy patrons donated land and funds and supervised their construction. The selection of sites took into consideration the monks’ need to be sufficiently far from town to be able to study and meditate in peace but also sufficiently close so that begging rounds could be fruitful without being too arduous and lay devotees could come by to request teachings. Over the centuries of Buddhism’s presence in India (ca. 400 BCE–1200 CE), Buddhist monasteries became great repositories of Indian culture and learning, the largest of them being the world’s first universities.

Introduction: Religious Literature

Many of the formative texts of the world’s religions were compiled between 1000 BCE and 300 CE. This was a remarkable period of religious-literary production through-

out Europe, Africa, and Asia. What is truly remarkable about these writings is how many of them still provide meaning to worshippers today. That 3,000 to 2,000 years of distance does

not weaken their power to inspire people demonstrates the tremendous abilities of these authors to provide insight into the world.

The fundamental texts of Greek religion, the works of Homer and Hesiod, were probably written at this time. There is some debate about when exactly the Homeric books (the *Iliad* and the *Odyssey*) were written, but even if they had been written earlier, they certainly became widespread early in this period. These texts were fundamental in establishing connections between the varieties of Greek religious traditions that were spread throughout the decentralized Greek world. They provided a framework in which Greeks could think of themselves as having a common religious tradition. And even though there are no longer any living participants in these traditions, the works of both authors are still read as deeply meaningful texts today.

Although many of the sections of the Hebrew Bible/Old Testament describe events that occurred prior to this period, most of the accounts were written down after 1000 BCE. This was also the time in which these varied writings were compiled into the Hebrew Bible, in a process called canonization, whereby it was decided which texts were holy or sacred and which were not (and which versions of each text were correct). The Dead Sea Scrolls are evidence of an alternative canon of biblical thought, including slightly different copies of biblical books and religious manuscripts unique to that community. This was also the period in which the books of the New Testament were written and the Christian Bible was compiled. The canonization of Bibles in both Judaism and Christianity did not stop the writing traditions in either religion. New types of religious writing, in which Jewish and Christian scholars interact with sacred texts, became common means of expressing theological ideas.

In India, the process of writing down the Vedic texts began before this period (the Vedic Age is thought to run from 1800 BCE to 600 BCE). Between 400 BCE and 400 CE, the major epics of Hindu literature were written down, and thus by the end of this period the fundamental texts of Hinduism (which are still important today) came into being. The *Mahabharata*, the *Upanishads*, and the *Bhagavad Gita* are not

only profoundly moving sacred texts but are also masterpieces of world literature. Around 500 BCE the Buddha began teaching in India, and following his awakening Buddhist writers compiled stories of his life and accounts of his teachings that still help modern Buddhists attempt the attainment of their spiritual goals.

What follows are introductions to this diverse variety of important sacred writings. East Asian texts (such as *The Analects*) are not presented here; those introductions can be found in the section “Philosophical and Religious Developments in East Asia” beginning on page 598.

—Kevin M. McGeough

Hebrew Bible and the Concept of Sacred History

The Hebrew Bible (Christian Old Testament) was composed roughly from the twelfth to third centuries BCE. The earliest passages are poetic (e.g., Exodus 15, Deuteronomy 32, and Judges 5) from which the surrounding historical-narratives have sometimes borrowed (e.g., Exodus 14; Judges 4). Yet the textual formation of the Hebrew Bible at large was centered on events spanning from 722 BCE to 539 BCE when two political powerhouses of the ancient world, Assyria and Babylon, attacked the ancient kingdom of Israel, forcing massive sectors of the population into exile.

In Jewish tradition, the Hebrew Bible is divided into three sections: the Torah, the Prophets, and the Writings. The Torah (Genesis, Exodus, Leviticus, Numbers, Deuteronomy), also known as the Pentateuch, is believed to have been finalized either during the exile (587–539 BCE) or later. The Former Prophets (Joshua, Judges, 1 and 2 Samuel, and 1 and 2 Kings) may have been written during the exile as well. For the Latter Prophets, there are two subcategories. First are Isaiah, Jeremiah, and Ezekiel, known as the Major Prophets due to their volume and prominence. Nearly half of Isaiah involves events of the exilic period, whereas almost all of the material found in Jeremiah and Ezekiel dates to the exile. Second are the Minor Prophets (Hosea, Joel, Amos, Obadiah, Jonah, Micah, Nahum, Habakkuk, Zephaniah, Haggai, Zachariah, and Malachi), which are closely related to the events transpiring around 722 BCE and 587 BCE. After the Prophets appear,

the Writings (Ruth, 1 and 2 Chronicles, Ezra, Nehemiah, Esther, Job, Psalms, Proverbs, Ecclesiastes, Song of Songs, Lamentations, and Daniel), the majority of which was written in the postexilic period (539 BCE and afterward).

To better understand the development of the Hebrew Bible, one must understand the major theories offered to explain it. The German scholar Julius Wellhausen (1844–1918) is most celebrated for his popularization of the Documentary Hypothesis, which claimed that the final form of the Torah was compiled from four strands: the Priestly (P) author (postexilic), the Yawistic (J), the Elohist (E) (eighth century BCE), and the Deuteronomist (D) (seventh century BCE). J and E represent a free primitive Israel without the centralized cult at Jerusalem. D, presumably the law book discovered in King Josiah's reign, altered this by establishing the principal place of worship at Jerusalem. P was written during the time of the sacerdotal and sacrificial system attributed (mistakenly) to Moses.

Although it has visibly shaped the scholarship of the Hebrew Bible, the hypothesis has suffered many criticisms. One critique lambastes Wellhausen for his anti-Semitic sentiments; another attacks his methodology, for in his publication he refrained from consideration of essential extrabiblical artifacts coming to light via archaeology.

Afterward, a different theory for the growth of biblical tradition appeared under the auspices of a second German scholar, Martin Noth. This theory took shape under the label of the Deuteronomistic History. It pertained not to the Torah but to the Former Prophets, with the book of Deuteronomy as its preamble. It described them as the production of one author, who collated various traditional sources to construct his history of Israel. The work was written as a unified whole, both in its language and attitude. Noth argued that the work was authored in the exilic period. Later, the Harvard scholar Frank M. Cross advocated a view that the Deuteronomistic historian worked in the preexilic period at the time of the Judean king Josiah (639–609 BCE), to whom the Deuteronomistic historian attributed great importance. In sum, as the ideas of Wellhausen have been confronted and amended, so have those of Noth. Nevertheless, they have become foundational

for current speculation on the development of the Hebrew Bible.

Dead Sea Scrolls

The Dead Sea Scrolls have been called the greatest manuscript discovery of modern times, not only because they include biblical manuscripts 1,000 years older than any we had before but also because they offer a firsthand view of the life of an ancient Palestinian community. The earliest known copy of the Hebrew Scriptures before 1947 came from the tenth century CE, about 1,100 to 1,600 years after most of them were composed. Extrabiblical sources for the history of first-century Palestine were also copies from centuries later, and they tended to convey the limited perspective of groups that became dominant much later.

Palestinian shepherds discovered the scrolls preserved in ceramic jars in caves about two miles inland from the northwest shore of the Dead Sea. Archaeologists subsequently determined that they originated from a monastic-like community of Jews who lived on a nearby plateau called Qumran until around 70 CE. Since the initial discovery, 11 caves containing manuscripts have been found, not all directly connected with the Qumran community. In addition to seven well-preserved scrolls, thousands of manuscript fragments were found, many of which scholars are still trying to piece together.

THE PIERCED MESSIAH TEXT

Translating and understanding fragmentary ancient texts is difficult and prone to errors, especially when the subject matter ignites strong religious feelings. One of the fragments found at Qumran became famous in 1991 when Robert Eisenman proclaimed it as evidence for first-century Jewish expectations of a slain messiah. It came to be called the Pierced Messiah text. Eisenman asserted that his interpretation was beyond doubt, but other scholars who examined the text disagreed. Today most consider it more likely that in this text the messiah is the victor who kills his enemy rather than the one being killed, as in the translation by Eisenman quoted here, followed by that of Geza Vermes.

Eisenman: “. . . and they put to death (possibly too ‘shall put to death’) the leader of the community, the Bran[ch of David] with wounds (also ‘stripes’ or ‘piercings’).”

Vermes: “. . . and the Prince of the Congregation, the Bran[ch of David] will kill him [by stroke]s and by wounds.”

Fragments of the “Pierced Messiah” text from the Dead Sea Scrolls. (Clara Amit/Israel Antiquities Authority)

The bulk of the Qumran manuscripts were written in the last two centuries BCE and the first century CE. The most important finds include scriptural texts; commentaries on scripture (*pesbarim*); rules and guidelines for the monastic community (the Damascus Document and the Manual of Discipline); a detailed description of a temple that was never built, with regulations for its worship practices (the Temple Scroll); a letter containing theological polemic between Qumran and other Jewish groups (“Some of the Works of the Torah”); and an eschatological text foretelling a great war (the War Scroll). Many smaller pieces of poetry and documentary texts (such as records of financial transactions) were also found.

The consensus among scholars is that these works were created by a Jewish sectarian community called Essenes by other first-century sources, though the Qumran documents themselves never use that name. A few historians have suggested that Qumran was just a military outpost for Jerusalem Jews or that it was a rich man’s villa, but they have gained few adherents.

The community organized its communal life around the study of scripture and saw itself as the community of the new covenant. It believed in resurrection and expected two messiahs, a Davidic one and a priestly one who would guide him. It was strongly deterministic, believing that God was in complete control of everything, and it saw the world starkly in terms of light and

dark, good and evil. Its members considered themselves to be sons of light.

The texts illuminate a forgotten segment of Judaism and its conflicts with other Jewish groups, and in so doing they portray a degree of diversity within Judaism that was not known before. They also changed our understanding of the development of the biblical text. Before their discovery we had copies of the Hebrew Scriptures in manuscripts from the tenth century CE and copies of a Greek translation called the Septuagint (LXX) from the fourth century. The text of the Hebrew version differs substantially from that of the Greek in places, and LXX variants were often thought to be corruptions or interpolations introduced in the translation process. We now know that the LXX often preserves ancient Hebrew traditions that we were not aware of before.

Before 1947 the consensus among historians was that all Jews shared one canon of scripture that crystallized by the end of the first century. The Qumran evidence helped undermine that view. This community of Jews revered other texts besides the ones in today's Hebrew Bible as authoritative, continued to write documents that claimed to speak with divine authority, and left no evidence of even having been interested in establishing what was in or out of the scriptural canon.

The Canonization Process in Ancient Judaism

The Hebrew Scriptures formed the base upon which Judaism, Christianity, and Islam were built and have profoundly influenced Western civilization as a whole. Today a broad consensus exists among the world's Jews on which scriptures (authoritative texts) are included in the canon (the final unchangeable list of writings accepted as scripture). But relative unanimity about this has been the rule only since the Middle Ages. From the fifth century BCE through the first century CE, various communities of Jews accepted different books as scripture. And up to the very end of that period, some communities were still adding to their collections.

The present collection consists of 22 books grouped into three sections according to the Jewish reckoning: the Torah ("Teaching"), Genesis through Deuteronomy in the Christian Old Testament, also called the Pentateuch; the Nebiim ("Prophets"), Joshua through Kings plus most of the books named after prophets; and the Ketubim ("Writings"), Psalms, Proverbs, Job, Daniel, and others.

Until the 1970s the consensus among historians was that these sections represented stages in a single canonization process within a monolithic Judaism. First was the Torah. Introduced by King Josiah in the late seventh century BCE, it grew in influence and attained scriptural status in the fifth century BCE. The catalyst for its canonization was the effort of Ezra and Nehemiah to rebuild Jewish society in Palestine after the return from Babylonian exile. The Torah brought with it the very ideas of scripture and canon among the ancient forebears of the Jews, and a religion was built around it. The word "canon" itself comes from Christian history, but the concept it represents is already expressed in Deuteronomy, which explicitly insists on obedience to it and warns against adding anything to it or taking anything away from it.

The canonization of the Prophets came next, centuries later. Many of these books were written and edited while the Torah was gaining ascendancy, but as a collection they did not achieve scriptural status until the second cen-

tury BCE. Finally, in a third phase, the Writings gained authoritative status by the end of the first century CE, and the complete tripartite canon of scripture was given a final seal of approval at the Council of Jamnia (or Javneh) in 90 CE, at which time the canon as it is currently acknowledged was finalized.

This image of a single clearly defined historical progression has fallen apart in the last few decades, in part due to archaeological discoveries such as the Dead Sea Scrolls and in part due to cultural change among historians. The evidence was always insufficient to support such clarity, but scholars with religious allegiances tended to share their traditions' presuppositions. Religious traditions often attempt to trace an unbroken line of historical continuity back to its earliest origins.

In fact, no direct evidence has survived indicating who did the canonizing, what they canonized, or when or why they did it. We do know that by the time of Alexander the Great (fourth century BCE), every Jewish group that left a historical record acknowledged the Torah as scripture. Some communities, such as the Samaritans, literally obeyed Deuteronomy's strict warnings against "taking away or adding" and permanently limited the extent of their "Bible" to the Torah. Others began to supplement it with new writings and by attributing scriptural status to older writings. As time went on, different groups of Jews created different collections of supplementary scriptures. We can see a snapshot of this process in the way the Qumran community developed writings to which it ascribed divine authority, such as the Temple Scroll and the Manual of Discipline.

Around the middle of the second century BCE, references to the tripartite scheme (Torah, Prophets, and Writings) begin to appear in some Jewish sources. By the first century CE this becomes fairly common though not universal; a few sources even cite the number of 22 (or by another count, 24) books but do not name them all. The first actual lists of books defining the extent of the canon come from the third century CE. There is no historical record of debates by religious authorities or anyone else as to the makeup of this canon.

➤ THE SEPTUAGINT—THE GREEK VERSION OF THE HEBREW BIBLE

When Alexander the Great's successors were spreading Hellenistic civilization in the third century BCE, many Jews adopted the Greek language but sought to preserve their cultural identity by translating their scriptures. According to a legendary account, 72 independent translators all miraculously produced exactly the same translation of the Torah, so the new Greek version came to be called the Septuagint (or LXX), from the Latin word for "70." Later other books were added, some translated from Hebrew and some originally composed in Greek.

The text of the LXX differs significantly in places from the Hebrew version that is currently in use. The Dead Sea Scrolls have revealed that some of the differences reflect variant versions of the Hebrew text that existed in the first century CE and earlier. Psalm 151, which exists only in the LXX and in Hebrew manuscripts from Qumran, is an example.

The LXX played a role in the rise of Christianity, for the Jews who created Christianity primarily read the Greek version of their own scriptures. The belief in personal resurrection arose in Hellenistic Judaism in the second century BCE and was faithfully passed on by the LXX. The LXX was used almost exclusively by the early Church as its scripture, and the New Testament quotes extensively from it.

—Thomas Dykstra

In particular there is no evidence that such a debate took place at the Council of Jamnia. The direct evidence for what actually happened there is limited to a few discussions preserved in the Mishnah about the status of a few scriptural books. The Mishnah itself was compiled more than a century later, and these particular debates are part of a text whose purpose was to function as training materials for rabbis, not to promulgate authoritative decisions. There is no evidence that the discussions were part of a council, that those who took part in them either had or asserted religious authority over all Jews, that any debate about a complete biblical canon took place, or even that the rabbis involved were

acting as a decision-making body of any sort for the few books whose status they did discuss (Ecclesiastes and Song of Songs).

How then did the present unanimity come about? As a result of the Roman suppression of the Jewish revolt around 70 CE, all groups claiming leadership of Jews except one were eliminated. That group developed into what would later be termed Rabbinic Judaism to reflect some continuity with the past (Judaism) but a very real break in a new direction (Rabbinic). Few sources that could illuminate the inner workings of this new structure of authority survive from the second through seventh centuries, but at the end of that dark period we have the present firmly defined closed canon of 22 books.

The vast majority of Jews accepted this newly closed canon, and it helped effect a change in how that religion understands scripture. Before the ascendancy of Rabbinic Judaism and its canon, most Jews focused their attention on the essential message of the Torah which permitted “adding” to its words in order to elaborate on and supplement its message. Once the canon was closed, the understanding of divine inspiration in Judaism shifted focus to the words themselves as the locus of divine inspiration. Even the characters within the words became sacrosanct. Christianity and Islam eventually followed a similar path, creating fixed canons and viewing the scriptures included in those canons as fundamentally different in inspirational character from all other writings.

The Christian Bible—Deciding What Is Canon

The process that produced the Christian Old and New Testaments extended from before 500 BCE to after 500 CE and determined the fundamental character of the religion. The formation of the New Testament began around 50 CE when Christian leaders started to write works intended to function as scripture (authoritative guides) for their communities. Various Christian groups continued to produce literature with that intention well into the third century, and in the fourth and fifth centuries one of these communities along with its choices for scripture became dominant for all of Christianity. The idea of canon then crystallized as a single forever-unchangeable collection of writings that are authoritative in a way fundamentally different from all other literature.

When Christianity began as a sect of Judaism in the first century CE, both were unique in the Greco-Roman world. The surrounding religions were polytheistic and took it for granted that a person could take part in multiple religious communities. For them, worshipping a god primarily entailed carrying out cultic actions such as sacrifices. But Judaism insisted that its adherents worship only Yahweh and obey His commandments, which were primarily ethical rather than cultic. Judaism perpetuated these values and an exclusive group identity by developing scriptures that adherents were expected to learn and obey. Christianity inherited these scriptures but shifted the emphasis from obedience to belief, for it asserted that the primary basis for a positive relationship with God was not ethical action but belief in Jesus as the Messiah promised in the Jewish scriptures. That made correct interpretation of those scriptures of critical importance and created a need for new scriptures to authoritatively interpret the old ones.

The first person who did this and whose writings survived was Paul the Apostle. To him the word “scripture” meant Jewish scripture, but he clearly presented his own writings as having divine authority, for he asserted his commission and authority from God in each epistle.

Others claimed authority for their writings by adopting the pseudonym of Paul (for example, 3 Corinthians and the epistles to Timothy and Titus) or another apostle. Some did it by writing works that related Jesus's own story and words (for example, the New Testament Gospels and the Gnostics' Gospel of Truth and Gospel of Thomas). And a few followed Paul's example of simply asserting a direct commission from God without other qualifications (for example, Revelation). There was not one united leadership of all Christian churches producing this literature but rather a proliferation of communities, each seeking to advance its own agenda in a process that continued for more than a century.

Christians writing about this new literature after the turn of the second century began to call it scripture alongside the books of Jewish scripture. This practice became more common throughout the second and third centuries but did not in itself imply the development of a canon, for there was no widespread belief that everyone had to agree on which works were or were not scripture. That openness to diversity began to change over the course of the second century in part due to some high-profile controversies among Christians over beliefs and scriptural interpretation. Marcionite Christians rejected Jewish scripture altogether and accepted only some of Paul's epistles and the Gospel of Luke. Montanist Christians believed that God was speaking directly through some of them as he did through Jesus, thus devaluing scripture as a source for learning God's will. Gnostic Christians saw Jesus as a purveyor of secret knowledge and revered their own gospel, which presented Him in that light. These three groups lost out in the long run and disappeared. But in order to argue that the so-called heretical communities were wrong, the winning side increasingly found itself arguing that certain books had to be accepted as scripture, certain others could not be accepted, and every genuine Christian had to agree on which was which.

We have very little evidence explicitly witnessing to debates among Christians as to why a given book should be accepted or rejected as scripture. Indirect evidence indicates that from

➤ WHICH ENDING OF MARK IS THE CANONICAL ONE?

No original manuscript by the author of a New Testament book has survived. To determine what the authors wrote, we rely on copies from hundreds of years later. But handwritten copies contain both accidental errors and intentional changes, and the problem is compounded when all we have are copies of copies of copies many times removed. Of more than 5,000 known manuscript copies of the New Testament in its original Greek, no two of significant size are exactly alike, and many of the differences are not trivial.

One example is the ending of the Gospel according to Mark. Modern English Bibles print verses 9–20 of chapter 16 but explain in a note that “some ancient authorities” omit them. This is because two of our three oldest and best complete manuscripts of the New Testament—Sinaiticus and Vaticanus from the fourth century—end Mark at verse 8. The major manuscripts that do have verses 9–20 are significantly later, dating to the fifth century. The additional verses contain the only postresurrection appearance of Jesus in Mark, so they significantly change the perspective of the book. Which perspective is canonical? The canon as a list of books by name cannot answer that question in this case or in many others like it for other New Testament books.

—Thomas Dykstra

the second century on Christians tended to accept works that were believed to be written by Christ's apostles, works that were thought to be ancient rather than newly written, works that supported orthodox beliefs and interpretations, and works that had seen wide use in the sense of being read publicly in many Christian churches over a long period of time. However, the decision-making process was less one of evaluating individual books than it was a case of one community becoming dominant and extending its preferred list to everyone.

Early in the fourth century Constantine made Christianity the official religion of the Roman empire. As he and his successors tried to make the religion a unifying force for the empire, they needed to promote uniformity within

Christianity itself. This led to the creation of the Nicene Creed in 325, and it is from later in the fourth century that we find the earliest evidence of attempts to establish a single list of books that all Christians everywhere must accept as scripture exclusively. The first such list that has survived until today and that contains the exact contents of the present 27 books of the New Testament was created in 367 by a bishop named Athanasius of Alexandria. More lists appeared after that, not all of them the same. But by the end of the fifth century most of the Christian world had reached a consensus.

The crystallization of the concept of canon helped to reshape Christianity. It directed so much attention to the New Testament as to de-emphasize the Old Testament, and Christians never even reached common agreement on the extent of the Old Testament canon. Moreover, by limiting the concept of scripture to one never-to-be-changed list of ancient works, the canon created in Christians' minds more of a dichotomy between divine revelation and ongoing human action than was true in the first centuries when they were still writing scripture. And by sealing the victory of one Christian group over many others, the canon ensured that only these books would be preserved, while other scriptures were often deliberately destroyed and were thus lost to subsequent generations. This helped to obscure until relatively recently the fact that from the beginning, as much as in our own time, there were many Christianities, not one, each with its own scripture, its own history, and its own view of Jesus Christ.

Syriac Language and Literature

The Syriac language (*leshana suryaya*) is part of the Afro-Asiatic language family and falls in the Semitic subgroup. It is a later development of the Aramaic language spoken in and around the confines of Edessa (Urhoy/Urhay in modern Şanlıurfa, Turkey) in northern Mesopotamia. Syriac is usually regarded as an Eastern Aramaic dialect that falls within the Northwest Semitic language family, which also comprises the various Canaanite languages including Hebrew and Phoenician.

Aramaic itself came into popular usage throughout the Near East under the expansion of the Neo-Assyrian empire (934–609 BCE) and gradually began to supplant Akkadian, whose cuneiform script became highly cumbersome. The Assyrians espoused the use of Aramaic due most probably to the simplicity of its alphabet (based on the original Phoenician), which would supplant the more archaic cuneiform script. It continued as the lingua franca of the Achaemenid empire, and by the time of Alexander of Macedon, Aramaic was used as the official language of all the nations from Asia Minor to Persia, from Armenia to the Arabian Peninsula. It was divided into a western dialect used in Palestine and Syria by the Jews, Palmyrans, and Nabateans and an eastern dialect, spoken in Mesopotamia predominantly by the inheritors of the Assyro-Babylonian heritage, which included religious groups such as Mandeans, Manichaeans, and the Mesopotamian Jewish community.

During the weakening of the Seleucid empire, small independent principalities were created by local peoples and dynasties. The most famous was the Kingdom of Osroene, whose capital Edessa was the seat of the Abgarid dynasty and among the first principalities to convert to Christianity in the second century CE following the spread of the religion. The city also became an intellectual and cultural center despite the constant changing of ruling powers from Parthian to Roman. Some of the earliest known Syriac inscriptions date to the second century CE and occur in Edessa and its environs.

There are about 80 existing Old Syriac inscriptions dated to the first three centuries CE.

The difficulty in distinguishing Old Syriac from Imperial Aramaic has made the usage of a distinct Syriac script the marker deemed most reliable. Early examples include an inscription dated to 73 CE and a deed of sale on parchment from Dura Europos that dates to 243 CE. All of these early examples of the language are non-Christian.

The Syriac language *leshana suryaya* is derived from the Akkadian word for Assyrian, *ashurayu*, with the removal of the original aleph and addition of an intrusive yod, which both appear under Greek influence. Interestingly, the earliest Syriac inscriptions in the vicinity of Edessa belong to the enigmatic Sabian community of Sumatar, 37 miles (60 kilometers) southeast of today's Urfa. This esoteric sect mixed their brand of Assyro-Babylonian astrology and Neoplatonic philosophy to create a syncretism that can be seen on the remains of the temple of the moon-god Sin, which certainly speaks to a continuity of Mesopotamian thought and culture.

Under the Edessan monarchs, Old Syriac became a well-defined language with greater rules and regulations than the numerous Aramaic dialects of Mesopotamia, especially with the advent of Christianity and the development of a true corpus of literature. Under the influence of Christianity the language and body of literature developed considerably and eventually became the liturgical and literary language of all the churches throughout the ancient Near East extending to India in the east and Armenia in the north. The simplicity of this language allowed for the Church Fathers to explain Christian values and dogma in a way both imaginative and poetic, an essential factor in captivating a Semitic-speaking audience. The use of natural symbolism is quite strongly present, although the language owes a great deal to Hellenic influence.

From the second century, Syriac was adopted by much of the church in upper Mesopotamia. Many renowned works found their way into Syriac Christian literature during this period. The earliest Christian literature was biblical translation, the Peshitta and the Diatessaron (the telling of the four gospels in one narrative) of one Tatian the Assyrian.

Another remarkable author and philosopher was Bardaisan of Edessa. Bardaisan ("son of the

➤ SYRIAC ALPHABET

The Syriac alphabet consists of 22 letters and no vowels but rather diacritical marks that denote vowel sounds. There are three major variants of the Syriac alphabet. The oldest and classical form of the alphabet is *Estrangela* ܐܠܦܒܝܬ ܐܪܡܝܐ; the name is derived from the Greek description *στρογγυλη*, which reflects the idea of being rounded. The Western script is usually written in the *Serto* ܐܠܦܒܝܬ ܣܪܬܐ (line) form of the alphabet, also known as the Jacobite script used by the Melkite, Maronite, and Syrian Orthodox and Catholic rites. Most of the letters are clearly derived from *Estrangela* but are simplified, allowing for ease of writing. The Western script is usually vowel-pointed with miniature Greek vowel letters above or below the letter, which they follow. The Eastern script referred to simply as *Madenhaya* ܡܕܢܗܝܐ is also sometimes referred to as Nestorian or Chaldean in reference to the churches that most actively use the script. The Eastern script resembles the *Estrangela* more closely than the Western script, being somewhat a midway point between the two. The Eastern script uses a diacritic system of dots above or below letters to indicate vowel sounds.

—Sargon George Donabed

leaping river") was born of pagan parents in Edessa around 154 CE. The Syriac works *The Book of the Laws of Countries* and *The Hymn of the Pearl* are generally thought to be Bardaisan's although it is possible that the first should be attributed to his son Harmonius. Bardaisan is considered a Gnostic, and his followers, the Bardaisanites, were deemed heretical by the more orthodox elements of the church. Despite this, he was still well respected by later authors of the Eastern Church.

The fourth century CE is considered to be the Golden Age of Syriac literature. The two giants of this period are Aphrahat the Persian Sage (270–345 CE), an Assyrian born in Adiabene who wrote 23 treatises or homilies on Christian life titled *Demonstrations* for the church in the Persian empire. Though he wrote numerous works, his *Demonstrations* is the only one that has survived and in fact has been translated into Ge'ez, Armenian, and Arabic, among other languages.

Ephrem Suryaya (306–373 CE), born in Nisibis, is perhaps the most well known of all Syriac-language authors. Known as the “harp of the spirit,” Ephrem wrote numerous hymns, poetry, and prose for the church within the borders of the Roman empire. Of the two famous styles of work ascribed to Ephrem were *mēm̄rê*, or homilies, in heptosyllabic verse and *madrāšê* based on the Bardaisanite model but utilized as educational hymns resplendent with imagery. Over 400 of his hymns still exist today, and Ephrem’s Syriac writings have been translated into numerous languages.

Sanskrit Plays

Examples of early Sanskrit plays of India are noticed in the dialogic hymns intended for performance during rituals contained in the oldest religious text of India, the Vedas (1500–800 BCE). Even though the religious epics of India, *Ramayana* and *Mahabharata*, are considered as texts of poetical tradition (*kavya*), it is probable that many episodes of these texts were performed, forming one of the early Sanskrit plays of India. In fact, this might explain the reasons for many of the early Sanskrit plays of India being based on the stories of the *Mahabharata* and *Ramayana* (300 BCE–300 CE). Therefore, the two important aspects of Sanskrit plays in

India are religion and high literary culture. Such high literary tradition and religion is not confined to Hindu plays but is also noticed in early Buddhist plays. Asvaghosha’s play, *Sariputra Prakarana* (*Legend of Sariputra*), based on the life of Sariputra, one of the foremost disciples of the Buddha, is one of the most well-known Sanskrit plays of early India and may have exerted a tremendous influence on Silk Roads Buddhism.

As noted above, the Sanskrit plays have originated as part of the religion and high literary tradition rather than the folk tradition, unlike other world cultures. The genre of *nataka* (theater or play) is not clearly distinguishable from the genre of *kavya* (poetry) in the Indian literary tradition, since theater remained a part of the poetry as poetry fulfilled the roles of theater by lending itself to performance. In the early historic period, the *kavya* is read aloud (*patya*) as it is seen (*drisya*) and heard (*sravana*) by an audience. Even though the latter two qualities are commonly associated with performance traditions, in India they are noticed as part of the *kavya* tradition, portraying the intricate association of *kavya* and *nataka* in Indian culture. It is also notable that early authors have written in both genres, which conforms to the high literary status of theater as that of or similar to poetry in India.

Although the qualities of a play are clearly defined by Bharata’s *Natyasastra* (*Theory of Dramaturgy*) (200 BCE–200 CE), Sanskrit theater is not totally separated from the literary style of poetry in the first millennium. In fact, the *nataka* remained firmly rooted in the *kavya* tradition, and Abhinavagupta (900–1035 CE), the author of *Abhinavabharati*, an authoritative commentary of *Natyasastra*, claims that the play is the highest form of poetry.

In fact, it is in this Sanskrit theatrical tradition known as Kudiattam (Dance theater of Kerala) that one of the oldest and best examples of Sanskrit plays was discovered in the early twentieth century. In 1912 Ganapathi Sastri came across manuscripts of the Sanskrit plays used in Kudiattam performances. These included *Svapnavasavadatta*, a play attributed to Bhasa by Rajasekhara (880–920 CE) in his text on poetics, *Kavyamimamsa*. Based on stylistic and linguistic analysis, all the plays in the group were attributed to Bhasa.

Bhasa's plays, *Pratimanataka* (*The Images*) and *Abhishekanataka* (*The Coronation*), are based on the *Ramayana*, while a number of his plays—*Pancharatra* (*The Five Nights*), *Madhyamavyayoga* (*The Middle Vyayoga*), *Dutaghatotkacha* (*The Envoy Ghatotkacha*), *Dutavakya* (*The Envoy's Message*), *Urubbanga* (*The Broken Thigh*), *Karnabhara* (*Karna's Burden*), *Balacarita* (*Tale of the Child, Krishna*)—are based on *Mahabharata* stories. Bhasa's play *Avimaraka* is a fairy tale, while *Daridra Charudatta* (*Charudatta, the Poorman*) is a romantic fictional story. His most famous plays, *Swapna Vasavadatta* (*Vasavadatta in a Dream*) and *Pratigna-Yaugandharayana*, are based on historical accounts of King Udayana of Ujjain.

Therefore, it is not surprising that one of the well-known and most well-preserved Sanskrit plays of early India, *Mricchakatika* (*The Little Clay Cart*) of Sudraka is derived from Bhasa's play *Daridra Charudatta*. In 1984 it became a popular Hindi film. The story of this play depicts the trials and tribulations of Charudatta, with numerous twists and turns including a triangle love affair, mistaken identities, theft, and jealousy.

The Mahabharata, the Ramayana and the Bhagavad Gita

The two great epics of Indian literature, the *Mahabharata* and the *Ramayana*, are multilayered texts that have their origins in historical events. Interwoven with these are other traditional sto-

KUDIATTAM

Kudiattam is a form of Sanskrit theater performed in the temples in the state of Kerala, India. It is recognized by UNESCO as one of the Masterpieces of the Oral and Intangible Heritage of Humanity (2001). Kudiattam was performed outside the temples of Kerala for the first time in 1955 for public audience in a theater by Padmasri Guru Mani Madhava Chakyar (1899–1990). As Guru Chakyar went on to perform in numerous other theaters throughout India, Kudiattam was brought to an audience located outside Kerala. The documentary film *Kudiattam* (1987; directed by Prakash Jha and produced by Prakash Jha Productions, Bombay) depicts the historical, cultural, and performance aspects of Kudiattam.

—Lavanya Vemsani

ries and myths. The epics probably began life as accounts of small local feuds between chiefdoms. These and other stories were retold by bards, who selected their material to suit their audience. Later the narrative was ordered into a more coherent form and written down, with additions that reflected the very different society of the later first millennium.

The *Ramayana* is said to have been composed by Valmiki, writing around the fourth or third century BCE. The *Mahabharata*, traditionally attributed to a brahman poet, Vyasa, was compiled by unknown writers around the same period, reaching its final form around the fourth century CE. Geographical and sociopolitical data indicate that the action of the *Mahabharata* belongs to a slightly earlier period than that of the *Ramayana* (although in the written version the *Mahabharata* includes a version of the *Ramayana* story). Various external and internal data have been used over the centuries to provide a date for the events of the *Mahabharata*, from 3102 to 836 BCE. The early first millennium BCE best matches the core sociopolitical conditions of the story, according to archaeological evidence, but the precise date cannot be determined any more than can the historicity of the core events.

Mahabharata and *Ramayana* are both written in Sanskrit *slokas*, a religious verse form using paired lines of 16 syllables each. *Mahabharata*

➤ BHAGAVAD GITA

A major late interpolation into the Mahabharata text is the poem known as the *Bhagavad Gita* (*Song of the Lord*); this has become one of Hinduism's most sacred texts. On the eve of the great battle, Arjuna, the middle Pandava brother, tells Krishna (his brother-in-law, acting as his charioteer) his doubts about fighting against his own kin. Krishna's reply is the *Bhagavad Gita* in which he expounds the sacred duties of a king: to set aside his own emotions and pursue righteous actions in accordance with the will of the gods, who have preordained the fall of the Kauravas.

Krishna elaborates the relationship between the individual and the divine, preaching the doctrine of transmigration. By combining *karma*, that is, action in accordance with *dharma* (righteousness and sacred duty), which in this case includes undertaking righteous war, with *bhakti*, love and personal devotion toward God, throughout many reincarnations, the individual will move ever closer to *moksha* (liberation from the cycle of rebirth), complete detachment from the material world and unity with God.

—Jane R. McIntosh

runs more than 74,000 verses, divided into 18 books (*parvas*), making it the world's longest poem. This draws on several earlier bardic versions, the *Jaya*, and the *Bharata* as well as later interpolations and adds didactic passages, including the *Bhagavad Gita*. Much of the poem is concerned with the Battle of Kurukshetra. The written version of the *Ramayana* likewise combines an earlier poetic cycle (Rama-katha, forming Books II to VI) with later didactic material (Books I and VII), giving in all 24,000 verses.

The *Mahabharata* story concerns the feud between cousins, the Pandavas and the Kauravas. Dhritarashtra is debarred by blindness from ruling the kingdom of Kuru. His younger brother Pandu becomes king but dies young, leaving five young sons (the Pandavas), the eldest of whom, Yudhishthira, becomes heir to the throne, with Dhritarashtra as his guardian and regent. Dhritarashtra's 100 sons (the Kauravas), led by the eldest, Duryodhana, are enraged by the situation. They unsuccessfully attempt to murder the Pan-

davas by arson. After escaping, the Pandavas woo Draupati, a princess of neighboring Panchala, who becomes the bride of all five. Thereafter the cousins agree to a compromise: the kingdom is divided, the Kauravas retain the settled area in the east, with its capital at Hastinapura, while the Pandavas gain the undeveloped western area, where they build a new capital, Indraprastha.

Yudhishthira performs the Rajasuya sacrifice, which demonstrates his power over neighboring communities: this fuels the Kauravas' jealousy. They invite Yudhishthira to a gambling contest, where he successively loses his wealth, his kingdom, his brothers, himself, and their wife. An attempt to strip Draupati is thwarted by divine intervention, her garment continuing infinitely as it is unwound. Horrified, Dhritarashtra negotiates the Pandavas' release from bondage; instead they will go into exile for 13 years before regaining their kingdom. When this time is up, however, Duryodhana is unwilling to relinquish his control of the Pandavas' kingdom, precipitating the 18-day Battle of Kurukshetra involving most of the kingdoms of India. Many perish, including Duryodhana and his principal supporters.

After a long reign, Yudhishthira establishes his great-nephew on the throne so that the Pandavas may journey toward Heaven. Due to their imperfections the others die on the way, but Yudhishthira reaches Heaven, where eventually he is reunited with all his deceased family.

Although the text of the *Mahabharata* speaks of kingdoms, the core of the epic reflects a time of smaller polities, clan chiefdoms of pastoralists and village farmers that were expanding into unoccupied forest and waste land. The setting and participants in this narrative were confined to the upper Ganges-Yamuna doab (Kuru). Stories like the *Mahabharata* were used to legitimate a ruler's authority through genealogical links to rulers and heroes of the past. Itinerant bards would perform versions of the story at major sacrificial rituals, emphasizing the role of players of local importance and adding tales of local relevance.

As *janapadas* (small kingdoms and republics) began to emerge in the Ganges Valley and elsewhere in northern India, the roll call of participants in the *Mahabharata* war expanded,

and the story was modified to reflect the increasing power of monarchies and their conquest of new territory, the development of urban life, and the growing importance of caste. Several major additions were made, mainly didactic, emphasizing the qualities and duties of a monarch as well as his territorial and dynastic rights and legitimizing the authority of monarchies.

The rise of Buddhism and Jainism in the later first millennium stimulated developments in Brahminical Hinduism, including the idea of transmigration (*samsara*), leading to ultimate liberation from existence in the impermanent world and unification with the divine (Brahman) and the Bhakti movement, which emphasized personal devotion to the deity, principally Vishnu. This is reflected in the literature of the period, including the *Bhagavad Gita* and later Upanishads such as Mundaka and Prashna Upanishads. Krishna, a hero on the Pandavas's side, was now transformed from a mortal prince into an avatar (incarnation) of Vishnu. Rama, the protagonist of the *Ramayana*, was also now identified as an avatar of Vishnu.

The narrative of the *Ramayana* takes place shortly after agricultural settlement had spread into the Ganges Valley. One of its central themes is the contrast between the excellence of monarchy and the barbarism of other forms of political organization; this is most apparent in the later additions to the text.

The king of Kosala is put in an awkward situation when his second wife calls in an open promise he once made her. She chooses to demand that her own son, Bharata, be made the king's heir in place of his older half-brother Rama and that the latter be exiled. Noble Rama volunteers to undergo 14 years of exile to honor his father's promise; the latter dies of a broken heart soon after Rama's departure. Bharata himself is unhappy with the situation. Having failed to dissuade Rama, he symbolically places his brother's sandals on the throne and governs only as his regent.

Rama, his wife Sita, and another brother, Lakshmana, take up residence as hermits in the wild Dandaka forest. A vengeful demon, Ravana, abducts Sita. Rama, wandering in search of her, arrives at Kishkindha, the kingdom of the monkeys, with whom he makes an alliance. One of

these, Hanuman, discovers Sita in Ravana's fortress on the island of Lanka. Rama musters an army and wages war on Lanka. Ravana is killed in single combat with Rama, and Sita is rescued. Rama returns to Kosala, where he rules in peace and prosperity. Sita undergoes an ordeal of fire, which proves that her virtue is unsullied. In the final book (VII), a later addition to the story, she is nevertheless banished due to the Kosalans' suspicions; she takes refuge in the *ashrama* (forest hermitage) of Valmiki, who raises the twin sons born to her there. Years later the twins, Lava and Kusha, attend an *ashvamedha* (horse sacrifice) performed by Rama and chant Valmiki's epic poem.

Ramayana was set in the middle Ganges region, Kosala lying southeast of the region that was central to the *Mahabharata*. To its east lay Videha, the kingdom of Sita's father, while the Dandaka forest, Kishkindha, and Lanka were probably located to the southwest in the Vindhya and the Mahanadi Valley. Later, however, the geographical focus extended farther south, with Kishkindha eventually becoming identified with the Tungabhadra Valley or the Nilgiri hills and Lanka with the island of Sri Lanka.

Early Greek Religious Literature

Literature pervades Greek society, appearing in such diverse forms as drinking songs at private parties, public festivals in which Homer's epics

► HYMN TO DEMETER

The *Hymn to Demeter* provides a literary account of Demeter's loss of and subsequent reunion with her daughter Persephone as a backdrop to an account of the establishment of the Eleusinian Mysteries, a cult dedicated to Demeter and Persephone that ensured a blessed afterlife for its initiates.

"She went to the kings who administer law . . . and revealed the conduct of her rites and taught her Mysteries to all of them, holy rites that are not to be transgressed, nor pried into, nor divulged. For a great awe of the gods stops the voice. Blessed is the mortal on earth who has seen these rites but the uninitiate who has no share in them never has the same lot once dead in the dreary darkness" (*Hymn to Demeter*, 473–482).

and plays were performed for the amusement and edification of the audience, and songs in honor of the gods sung at religious festivals. Much of this literature, regardless of the venue of its performance, featured accounts of the gods and their interactions with mortals, making it difficult to determine which works of literature qualify as purely religious and which as purely secular. One useful criterion is the occasion of the performance rather than the content of the poem: literature intended for performance in a religious context can be classified as religious. Regardless of its classification, Greek literature provides a great deal of information about Greek beliefs in and attitudes toward the gods, the relationship of mortals to gods, and religious practices.

Homer's *Iliad*, the story of Achilles' anger and its consequences toward the end of the Trojan War, involves much interaction between gods and mortals, ranging from the gods com-

menting on and interfering in the actions of humans to mortals attempting to appease the gods and enlist their support. The *Iliad* is not a glorification of the gods but instead uses the gods as a literary device to advance the plot and to illustrate one of the major themes of the poem. Unlike the ageless, deathless, and carefree gods, mortals are beset with many worries before their inevitable deaths, a fate from which only posthumous remembrance can save them.

Hesiod's *Theogony* is the story of the birth of the universe and the gods, the rise to power of Zeus and the other Olympian gods, and Zeus's governance of the world in accordance with justice. Hesiod's *Works and Days* is a didactic poem explaining the origin of strife in the world and the need for mortals to work hard and in accordance with justice. Both poems use the gods, and in particular Zeus, to demonstrate the nature of justice and the gods' concern for the proper governance of the universe.

The Homeric *Hymns* have a greater claim to being considered religious literature. They are a collection of individual songs celebrating particular gods that were composed by anonymous authors over centuries for performance in festivals. The longer poems narrate discrete episodes from the lives of various gods (e.g., *Hymn 3*, a poem explaining Apollo's birth and his establishment of his cult at Pythia), while the shorter ones are brief invocations of various gods intended as dedicatory introductions to longer compositions.

Stories of the Buddha

Stories of the Buddha's previous lives are among the most popular stories of South Asia. Reborn here as a king, there as an elephant, the future Buddha (called the bodhisattva) exemplifies the ideals of Buddhist ethics. Termed Jatakas (Birth Stories), 547 such stories are recorded in the Pali canon of the Theravada Buddhists. Many Jatakas are depicted in prominent and detailed carvings around the ancient Buddhist monuments of Bar-

THE BUDDHA AND MARA

One of the stories of the Buddha that is often depicted in art is his confrontation with Mara. The Buddha is often shown touching the earth in the moment just before his enlightenment. In response to the challenge of the demon Mara, he is calling the earth as a witness of his great deeds of the past that permit him the right to sit on the throne of enlightenment. The earth trembles and terrifies Mara's armies into flight, for the earth has witnessed the Buddha's many great deeds from previous lifetimes, as told in the Jataka tales. In this third century CE slate statue, Mara is shown attacking the Buddha.

hut and Sanchi, and their popularity was only extended after being retold by the Sanskrit poet Arya Sura.

The last of the Jataka tales, the story of Prince Vessantara, is reenacted and retold regularly in numerous Buddhist communities. It is last because it takes place just before the bodhisattva ascends to Tusita heaven, from which he will descend to be born into his last body, the body in which he will achieve enlightenment and so become Buddha. The *Vessantara Jataka* is thus the story of a bodhisattva's final preparations before he is ready to become a Buddha.

Prince Vessantara's distinguishing characteristic is his generosity, and his four inconceivable gifts drive the plot of the story. The prince has a magical elephant that ensures rain for the crops of his kingdom of Sivi. When he is asked by neighboring Brahmins to give them the elephant to save their failing crops, he does so (gift number 1). This enrages the populace, and they demand that he be banished. Vessantara agrees, but before entering the forest with his wife and two children he gives away all of his possessions in what is termed the Gift of Seven Hundreds (700 decorated horses, 700 chariots, etc.; gift number 2). Once in the forest, he is asked for

and gives away first his children (gift number 3) and then his wife (gift number 4). Remarkably enough, the story ends happily with the family reunited back home, but the pathos of separation is the story's main theme and the interest in each dramatic retelling.

These were only the last of the bodhisattva's many great, meritorious accomplishments, and numerous other Jatakas also tell of the future Buddha sacrificing himself for the sake of others: for example, he feeds his own body to a starving tigress to keep her from eating her cubs. Still, many of the stories are fables with a lighter morality, promoting virtues such as co-operation, learning, and respect.

Surely the most famous story in the Jatakas is that of Prince Rama, as told in the *Dasaratha Jataka*. Best known in versions that stem from the Hindu *Ramayana* by Valmiki, this story was crystallized in a Buddhist Jataka at around the same time as it became a tale of an incarnation of the great Hindu god Vishnu. The sameness of these stories suggests an earlier folkloric circulation, and scholars believe that the majority of the Jatakas should be similarly understood as Buddhist restatements or revisions of traditional tales.

Sutra Literature and Early Indian Philosophy

The *sutra* is a genre of literature (or one verse unit of that genre) that appeared in the middle of the first millennium BCE in two quite different forms: an orthodox form (accepting the authority of the *Vedas*) and a Buddhist form. In the orthodox Indian schools of traditional Brahmanical ritual, the commentarial literature on the *Vedas* had been expanding over several centuries. With the *sutra* literature, the new goal was brevity. *Sutras* were terse summaries of all of the essential points in a field of inquiry, condensed into brief chunks that were easy to memorize. It had come to take many years just to learn how to recite the Vedic scriptures correctly, never mind comprehending their content. The *sutras* made it newly possible for a student to master a topic in a comparatively brief time.

The Sanskrit word “*sutra*” means “thread,” and there is a metaphor here of knowledge being woven out of these slight threads, indeed of the fabric of knowledge being, potentially, one single continuous thread woven back and forth against itself. Yet to understand a *sutra* always requires not just the thread itself but also a commentary. The language of a *sutra* is so concise that even when the phrasing is coherent and grammatically complete, the *sutra*’s layers of meaning are incomprehensible without a guide. Once explained, however, a memorized *sutra* becomes a densely packed treasury of meaning.

Two major categories of ritual (*kalpa*) were summarized in two different kinds of *sutras*: rituals performed by Brahmins (priests) in the *Shrauta Sutras* and rituals performed by house-

holders in the *Grhya Sutras*. In addition, *Sulva Sutras* laid out the measurements and calculations for setting up the sacred altars and enclosures described in *Shrauta Sutra* rituals. Finally, the *Dharma Sutras* provided the householder with additional rules to guide not only the performance of ritual but also all of life.

In addition to rituals themselves, the Vedic schools had taught a variety of methods for interpreting and applying the Vedic corpus. *Sutras*, their commentaries, and their related treatises (*shastra*) were developed on a wide range of so-called limbs of the Veda (*vedangas*) covering pronunciation (*shiksha*), metrics (*chanda*), grammar (*vyakarana*), etymology (*nirukta*), and astronomy (*jyotisha*). As each of these areas of knowledge developed its own specialized literature, the Vedic schools lost their centralized control over these memorized (*smṛti*) forms of text (as opposed to Vedic scriptures themselves, classified as “heard,” *śruti*). Before long, autonomous specialists called *Vaiyakaranas* taught grammar under their own auspices, *Nairuktas* taught etymology, and so on.

In a parallel development, philosophical *sutras* became the basis of the six orthodox systems of Hindu thought and practice: *Samkhya* of Kapila, *Yoga* of Patanjali, *Nyaya* of Gautama, *Vaisheshika* of Kanada, *Purva Mimamsa* of Jaimini, and *Vedanta* of Badarayana. Each of the authors here listed must have been only the final *sutra* redactor writing an authoritative commentary after some generations of his tradition’s development. Each school has a somewhat different worldview and endorses a different system of discipline and study.

During this same period, the largest of the nonorthodox schools, the Buddhists, were also naming a category of their own scriptures as *sutras* (Pali, *suttas*). For Buddhists, the texts that make up the “Basket of *Sutras*” (*sutta-pitaka*) are sermons given by the Buddha or approved by him. The Theravada Buddhist canon also includes two other baskets, one that contains monastic rules (the *vinaya-pitaka*) and the other an early form of Buddhist philosophy termed the “further dharma” (*abhidhamma-pitaka*). A Buddhist *sutra* is easily identified by its opening line: “Thus have I heard.” This statement is

placed up front to indicate its authenticity, for it was heard, as written, by the Buddha's chief disciple Ananda.

The Christian Gospels and the Book of Acts

The New Testament Gospels (Matthew, Mark, Luke, and John) and the book of Acts represent types of Christian literature that proliferated after the death of Jesus, whom they called Christ (“anointed one”). Originally written in Greek, the Gospels are examples of ancient biographies that integrate Hellenistic and Jewish literary forms, drawing from such genres as lives of philosophers, hero tales, and Jewish prophetic texts. The term “Gospel” comes from the first few lines of the Gospel of Mark, “The beginning of the Gospel [*euangelion*, literally ‘good news’] of Jesus Christ the Son of God” (Mark 1:1). Since the Gospels are good news, they were not written as histories or biographies in the modern sense. The Gospel writers were not attempting to be objective or to write factual accounts. Rather, Gospels served as written proclamations of the good news of salvation promised by the teachings, life, suffering, and death of their hero-leader-teacher and thus are closer to modern advertisements than to histories.

The first three books of the New Testament are called Synoptic Gospels because they all follow a similar narrative sequence. The first of these is Mark, written around 70 CE. Mark seems to have had a number of texts at his disposal, such as collected miracle stories and sayings of Jesus, and wove his narrative together focusing on Jesus's teachings, suffering, and death. Around

▶ LUKE 1:1–4

In the following passage from the Gospel of Luke, Luke discloses that he was not an eyewitness of Jesus but is drawing from other sources (including the Gospel of Mark) in order to write his own account of the life of Jesus. No other writer of a gospel gives so much evidence about the process of his own writing.

“Since many have undertaken to set down an orderly account of the events that have been fulfilled among us, just as they were handed on to us by those who from the beginning were eyewitnesses and servants of the word, I too decided, after investigating everything carefully from the very first, to write an orderly account for you, most excellent Theophilus, so that you may know the truth concerning the things about which you have been instructed.” (Luke 1:1–4)

—Jeffrey Trumbower

90 CE the authors of Matthew and Luke used Mark but seem to have also used a sayings source called Q (for the German word *Quelle*, meaning “source”), which is now lost. Their Gospels end with Jesus's followers spreading the good news to the world. The author of Luke also wrote the Acts of the Apostles, designed to be the second part of a two-volume work. Luke-Acts begins with Jesus's life, teachings, suffering, and death, like the other Synoptics, but then recounts the adventures of the Apostles throughout Asia Minor, ending with the Apostle Paul's imprisonment in Rome. The Gospel of John is somewhat dissimilar from the other narrative presentations and focuses more on Christ's divine nature, minimizing his Jewish lineage. Thus, the common thread that connects all these Gospels is that Jesus was sent by God to save all people from their sins by means of His death and resurrection. The Gospels and Acts are considered sacred to Christians since they preserve this message.

The Gospels and Acts in the New Testament are only examples of the many Christian writings from the first three centuries CE. Many Christian texts were destroyed or lost during

the canonization process because the Church disapproved of their inclusion in the Bible. Fortunately, many were rediscovered in 1945 at Nag Hammadi, Egypt. These included the gospels of Thomas, Mary, and Philip. There were also many extant texts that recounted the deeds of various apostles. These included the Acts of Andrew, Paul, and John, which were preserved in collections known as Apocryphal Acts of the Apostles.

Early Christian Apologetics

"Apologia" is a Greek word meaning "defense." It derives its meaning from the law courts, where defendants attempted to prove their innocence. As the early Christian movement faced hostility from both non-Christian Jews and Greco-Roman polytheists, certain Christian writers sought to mount a defense of Christianity, attempting to prove its worthiness. The aim of early Christian apologetics was not so much to convert others, although that could be a by-product, but rather to secure respectability and tolerance for their new religion.

There are apologetic elements in many types of early Christian literature. For instance, the Acts of the Apostles tried to demonstrate through its narrative that Christianity was compatible with the Roman government and posed no threat to the established order. In the second century CE, a group of writers emerged who are known collectively as the early Christian apologists. They included Greek authors Justin Martyr (d. 165 CE), Theophilus of Antioch (fl. 169–177 CE), Athenagoras of Athens (fl. 176 CE), and the

Portrait of Tertullian from 1584 CE. (Thevet, André. *Les Vrais Pourtraits et Vies Hommes Illustres*, 1584)

Latin author Tertullian of Carthage (fl. 180–220 CE) among others. These writers protested the unjust treatment of Christians at the hands of hostile governments and mobs but steadfastly maintained their loyalty to the Roman empire. They did not seek to overthrow the empire but rather to reform it to provide a space for Christianity. To this end, they argued for the great antiquity of Christianity, connecting it to Abraham, Socrates, and the ancient philosophical impulse toward monotheism in the Greek tradition. They often claimed that Plato had read the books of Moses, and they did this to prove that whatever was worthy in the Greco-Roman tradition had actually been derived from Christianity, broadly conceived to include all pre-Christian Judaism. They portrayed Christianity as a philosophical school similar but superior to Platonism, Stoicism, and the rest. In the process they gave Christianity itself a more secure grounding in the philosophical tradition.

The third century CE saw the emergence of a new Christian apologetic literature aimed squarely at philosophical attacks mounted by non-Christians. Around 170 CE Celsus (possibly a former Christian) penned a devastating attack on Christianity that was not answered until Origen of Alexandria took up the challenge in his *Contra Celsum*, written around 248 CE. Later that century, the Neoplatonist Porphyry wrote against the Christians, again eliciting apologetic responses. The character of Christian apologetics changed dramatically after Constantine, since during his reign the government became an ally of a certain form of Christianity rather than its persecutor.

—Jeffrey Trumbower

➤ ST. JUSTIN MARTYR, *FIRST APOLOGY*

The group of writers known as the early Christian apologists sought to gain greater tolerance for Christianity within the Roman empire by arguing for the historical and philosophical continuity of Christianity with Greek and Jewish tradition. This strategy is exemplified below in a quotation from *St. Justin Martyr: The First and Second Apologies*:

“We have been taught that Christ is the First-born of God, and we have suggested above that He is the Logos of whom every race of men and women were partakers. And they who lived with the Logos are Christians, even though they have been

thought atheists; as among the Greeks, Socrates and Heraclitus, and people like them; and among the barbarians, Abraham . . . and many others whose actions and names we now decline to recount, because we know it would be tedious.”

—Jeffrey Trumbower

Near Eastern Prophecy, 1000 BCE–300 CE

The main evidence of Near Eastern prophecy from the period 1000 BCE to 300 CE comes from the seventh century BCE capital of the Assyrian empire, Nineveh. Its ruins lay near modern Mosul, Iraq, the prophetic corpus within Jewish and Christian Bibles and other early Jewish writings.

Besides numerous references to prophecy in a variety of documents, the Neo-Assyrian evidence includes 29 oracles on 11 cuneiform tablets from the reigns of Esarhaddon (681 to 669 BCE) and Assurbanipal (669 to 631/627(?) BCE). The prophets speak primarily, but not exclusively, in the name of the goddess Ishtar of Arbela and sometimes in her guise as Mullissu, wife of the god Assur. They concern the well-being of

the king, the security of his rule, treaties, and military fortunes. On rare occasions lapses in royal piety are alleged. These oracles were collected and preserved for posterity, presumably because of their numerous words of encouragement for the monarchs. These collections show signs of editing or “redacting” in the use of formulaic language and styles that mask the *ipsisma verba* (actual words) of the prophets.

Assyrian monarchs did not correspond directly with the *mabhu* (comparable to Mari’s “ecstatics”) and *raggimu* (“shouter” or “repeater”) but treated their pronouncements seriously. An indignant astrologer once wrote to Esarhaddon after being snubbed by the monarch in favor of male and female prophets. Oracles were not usually subject to verification through other divinatory techniques. One exception appears in a letter that advises the king to test an oracle from Nusku by a female slave supporting a rival claimant to the throne and to execute all concerned with the affair.

The Christian Old Testament or Jewish Tanakh contains many documents named after and attributed to prophetic spokesmen for the deity Yahweh. Biblical narratives also refer to other prophets including Moses. Prophets of rival deities and those who allegedly speak falsely in the name of Yahweh are frequently denounced.

The most frequent Hebrew term for prophet is *nabi* (cognates of this term appear elsewhere

in the ancient Near East) and some of these are also claimed to be priests. *Hozeh* “see-er” also appears as does “man of God.” Groups of apprentices or disciples are sometimes called “sons of the prophet.” The biblical prophets are sometimes described as having ecstatic experiences. Most often, however, divine words are said to “come” to a prophet or the prophet merely announced a revelation with a phrase like “Thus says Yahweh.” The biblical prophets typically decry lapses in morality and piety and predict divine judgment on Judah and Israel which are played out against the military and political fortunes of these kingdoms. These texts also look forward to a time of restoration in which opposing nations will either accept the lordship of Yahweh, or as is more often the case, be soundly defeated in battle.

Prophecy in ancient Israel probably followed patterns roughly comparable to that of surrounding nations, but there is little evidence of the biblical prophets outside of the Bible itself. A letter dating to the Babylonian assault on Judah found in Lachish (tell ed-Duweir, southwest of Jerusalem) mentions a prophet. Another important discovery was a broken plaster inscription found at Deir Alla in Jordan written between 840 and 760 BCE. This revealed the name of Balaam, a prophet within the biblical tradition. The inscription was written in a local dialect with Aramaic influence but included some key phrases from the biblical story. Rather than confirm the existence of the biblical figure, however, this site seems to indicate that Balaam was a legendary figure popular among people on both sides of the Jordan River.

The majority of scholars hold that most biblical prophetic books contain actual quotations from the eponymous prophet. Some are far more cautious, advising that the Bible projects idealized prophets onto Israel’s past. Many significant textual variants exist and no manuscripts date prior to the second century BCE. The biblical materials have been extensively edited and expanded. For example, Isaiah has considerable material that presupposes Judah’s defeat by Babylon (587 BCE), long after the time Isaiah was supposed to have lived (eighth century BCE). Many “prophecies” are *ex eventu*, written after the events they purport to predict (e.g., the book of Daniel).

The complex representation of prophecy preserved in the Bible is indicative of the unique status of holy books in later Judean and early Jewish society. Even the interpretation of written prophetic oracles became to be seen as an act of inspired prophecy itself, as evidenced in some of the Qumran interpretations (*pesherim*) of biblical books. The New Testament regards Psalms (devotional poetry) to be prophetic in nature, predicting the coming of Jesus as the Messiah (Christ). Jewish tradition groups together not only the oracular books but many historical narratives in a canonical division called “The Prophets.”

A related phenomenon was the rise of apocalyptic literature. Apocalypses put *ex eventu* prophecies into the mouths of legendary figures from biblical tradition. A strong element of eschatology (thought about the end of history) and judgment on humanity marks these writings. Daniel in the Jewish Bible and Revelation in the New Testament are the only apocalypses included in the Bible, although both Jews and Christians wrote apocalypses for a few centuries into the Common Era. The Ethiopian book of Enoch (sometimes called First Enoch) became part of the Ethiopian church’s expanded canon.

Other ancient religions were also rooted in prophetic traditions. The origins of the Persian religion of Zoroastrianism (persisting today among the small Parsi community in India and in a wider diaspora) is attributed to a prophet named Zarathustra or Zoroaster, although considerable uncertainty surrounds this figure. He may have lived in the seventh or sixth centuries BCE. The Gathas, part of the Avesta scriptures, are said to contain his words. Islamic tradition includes reference to pre-Islamic prophets in Arabia although the sources are usually too recent to say much of certainty regarding them.

■ Introduction: Art Inspired by Religion

The profound truths and sacred messages of the religions of the world have long been deeply inspirational for artists. The period from 1000 BCE to 300 CE was a period of profound development in both the religious and the artistic spheres of life, so it should come as no surprise that a variety of artistic depictions of these religious developments were created. This section gives some examples of how classical art and classical religion mingled in this formative time.

—Kevin M. McGeough

Jewish Temple Images

The most significant image of a Jewish temple is that of the Temple in Jerusalem, which has been a focus of veneration in both Judaism and Christianity and has a long history in both religions.

The Temple of Jerusalem has three main periods. King Solomon built the first Temple in Jerusalem in the mid-tenth century BCE, and this Temple was destroyed by the Babylonians in 586 BCE. The second was the reconstruction of the Temple by Zerubbabel circa 500 BCE, and the third was built by Herod I, completed in circa 10 BCE and destroyed by the Romans in 70 CE. Although there were other attempts to rebuild the Temple, the image of the Temple through history evolves around these three periods.

The biblical descriptions of the Temple of Solomon are found in I Kings 6–8, written in the sixth century BCE; in Chronicles, written in the fourth century; and in other ancient texts such as the Talmud, the Septuagint, and the first two Books of Paralipomenon. The prophet of Ezekiel, chapters 40–42, also described the Temple,

although he described a vision of the Temple rather than a real Temple. Descriptions of Herod's Temple can be found in Josephus and Philo from the first century CE.

There are small inconsistencies in these descriptions, which led to variations in later reconstructions of the Temple. However, the basic form of the Temple was in three sections: the porch with the two freestanding columns Jachin and Boaz, then through into the holy place where the daily offerings of shewbread were placed, and finally the Holy of Holies where the Ark of the Covenant stood. The Ark of the Covenant disappeared after the destruction of the Temple of Solomon, and the Holy of Holies remained empty in the two subsequent Temples. The depiction of the Ark in these later Temples became emblematic of the faith.

The earliest extant image of the Temple is on coins that date from the period of the Bar Kochba revolt against Emperor Hadrian in 132–135 CE. The image is of the Temple facade with a flat roof and four columns; there the three openings between the columns and the middle one reveals, through the open doors, the Ark of the Covenant. The coin appears to represent the Temple of Herod that was destroyed 60 years earlier. The image is in the Roman artistic tradition, showing the facade and the emblem of the religion for easy identification. The open door also depicts the yearning and hope for the rebuilding of the Temple.

On the western wall of the synagogue in Dura-Europos, on the banks of the Euphrates River, Syria, are depicted symbolic images of the Ark of the Covenant, the Tabernacle in the desert, and the Temple of Jerusalem. These images are dated circa 244–245 CE, and they reveal a

➤ A COIN OF REVOLT

This coin was minted in 132–135 CE by Bar Kokhba (Simon, son of the star), the leader of the Second Revolt of the Jews against Rome. The coin depicts the facade of the Second Temple of Jerusalem, which was destroyed by the troops of Emperor Titus in the first revolt in 70 CE. Also portrayed are Simon's name in Old

(Erich Lessing/Art Resource, NY)

Hebrew letters and a star that is symbolic of his name that can clearly be seen above the temple. At the time the coin was minted, there was no temple or temple treasury. The coin was minted to establish Simon's sovereignty in Judea.

—Tessa Morrison

change in the mood of the depiction of the Temple. The representation of the Temple is similar to the one on the coin in that the facade has a flat roof and four columns, but now the doors are closed, representing the lost Arc and the loss of hope in the immediate rebuilding of the Temple.

Three gold-gilt glasses found in Rome, dated to the late third or early fourth century and retained in the collections of the Israel and Vatican museums, have the Temple portrayed as having a colonnaded court, which is flanked by the porch columns, Jachin and Boaz, and although the facade of columns is represented, the roof is now gabled. In front of the Temple a seven-branched candelabra is now depicted.

These symbolic elements of the Temple become entrenched into Jewish iconography. However, by the fourth century the image of the Temple was no longer only presented within the context of Judaism, and representations of the Temple began to appear in the Christian context. The image of the Temple became a powerful and enduring image in two mainstream religions and continued to evolve, revealing important changes in the philosophy of architectural design and meaning in the process.

The Development of Greek and Roman Religious Art and Architecture

In ancient Greece and Rome, religion did not exist as a separate category from the rest of human activity. Thus, while spaces, structures, and images that primarily served cults were important, religious significance could mark art and architecture dedicated to a surprisingly wide variety of purposes. Conversely, traditional Greco-Roman religious practice, based on sacrifice, never required a structure or image. In its most basic form, sacrifice required merely something to be sacrificed, most commonly an animal, but also wine or bread, a means to perform the ritual killing, and an altar (Greek *bomos*, Latin *ara*), that is, a place to burn or pour the portions of the offering dedicated to the god. This corresponds to our earliest evidence of cultic activity, with architecture and the visual arts embellishing these sites only later.

Our first evidence of Greek sacred architecture (ca. 1100–800 BCE) consists of low walls that formed a boundary (Greek *temenos*) around a sacred precinct, often associated with a natural feature such as a sacred spring, grove, or mountain. The concept of a temple (*naos*) with a cult statue emerged much later (ca. 700 BCE) through contact with the more advanced cultures of Egypt and Mesopotamia. Situated within the *temenos* opening east, the earliest temples adapted the

► REMAKING ROMAN RELIGION THROUGH ITS URBAN TOPOGRAPHY

As part of his program to remake Roman culture, Augustus (63 BCE–14 CE), Julius Caesar's heir and Rome's first emperor, exploited the fact that the Romans experienced their relationship to the past and to the divine through the architectural and visual environment of their city. Augustus was particularly adept at manipulating Rome's sacred architecture and urban topography to fuse his family and personal history into the Romans' experience of their ancient traditions. For example, in the area before the Senate in the Roman Forum, Augustus built a temple to the divine Julius, which he flanked with his rebuilt temple of Castor and Pollux and triple-bayed triumphal arch, in effect creating a space dedicated to his and his family's legacy out of what had been the premier public space of the Roman republic. Similarly, Augustus built a temple to Mars Ultor (Mars the Avenger) to

celebrate both fulfillment of a vow to avenge the murder of Julius Caesar and Rome's military victory over its external enemies. The space before the temple contained such images as Rome's founders Aeneas and Romulus intermixed with Augustus and his family. Augustus's Ara Pacis, an open-air marble altar dedicated to Peace, juxtaposed images of Augustus as chief priest (*pontifex maximus*) with images of mythological founders in similar attitudes of sacrifice. On a smaller scale, Augustus systematized Rome's many outdoor altars to the spirits (*lares*) of the crossroads (*compitum*), marking each of these local neighborhood cult sites with imperial sponsorship and images. In a span of less than a generation Augustus succeeded in placing himself at the center of Roman culture as well as political power.

—Matthew Canepa

same thatched-roof, mud, and wood architecture used for normal human habitation, in effect providing a house for the god. In this primitive era, a wide variety of objects could embody the god who lived inside: sometimes a *baitolos* (an uncarved, often meteoric, stone), a *xoanon* (rough wood idol) or, again under the influence of Egypt and Mesopotamia, an *agalma* (a wood, stone, or bronze statue fashioned into human form), all of which could receive cultic service, such as ritual bathing, clothing, feeding, and procession.

Adapting technology first from shipbuilding and later Near Eastern quarrying techniques, the archaic Greek city-states transformed these mud huts into monumental wood and then stone temples, much larger and more elaborate than any private citizen's abode. The size and richness of these sanctuaries soon reflected the importance or aspirations of their sponsor, be it a city-state (*polis*) or a Panhellenic sanctuary, such as Olympia or Delphi. Often encompassing a diverse assemblage of natural features, altars, and structures from many periods, larger sanctuaries could even include theaters and stadiums, as the competitions that took place in them were considered sacred activity too. The main public cult still took place on open-air altars, and normal worshippers would rarely if ever glimpse the actual cult statue.

Temples also functioned as a showcase for gifts, including art objects, dedicated by worshippers. They were displayed in the temple precincts and sometimes in the *opisthodomos*, a screened-off space opposite the entrance to the cella (inner chamber). At Panhellenic sanctuaries, city-states built their own treasuries, often smaller adaptations of temple architecture. The structure and the art objects in it functioned as elaborate showcases for the city and its citizens.

By the Classical era (479–333 BCE), the typical Greek temple opened east, was made of stone, and was embellished with brightly painted relief sculpture. Conforming to the strictures of the Greek orders, a colonnade surrounded the cella and was covered with a peaked roof. Colossal cult statues occupied the cellas of the most lavish temples, such as the Athenian Parthenon or the Temple of Zeus at Olympia, and could be made out of precious materials such as gold and ivory (called a *chryselephantine* statue). The relief sculpture that embellished the pediment and friezes interacted with the worshipper's experience in approaching the temple and often contained thinly veiled political commentary on the civic or foreign politics.

With Alexander's conquests (333–323) spreading Greek culture throughout the Near East and

South Asia, Greek sacred architecture became a tool of global empire. Many Hellenistic kings sponsored lavish religious structures to bolster their rule, such as the Attalids's Pergamon altar in Asia Minor (ca. 180 BCE) that was covered in elaborate reliefs. Conversely, local religions appropriated Hellenistic art. In northern India and Afghanistan, classical visual forms embellished Buddhist *stupas* and the narrative reliefs that decorated them.

Archaic Roman sanctuaries (Latin *fanum*) ranged from a simple *sacellum*, a demarcated space with an altar (*ara*), to complexes containing various sacred structures (*aedes*). Like Greek temples, the earliest Roman temples (*templum*) functioned as houses for cult objects and were an outgrowth of domestic architecture. Initially, Roman temples were indistinguishable from those of their Etruscan overlords, themselves adaptations of Greek ideas of sacred architecture. Constructed of wood with terra-cotta roof tiles and sculpture, these early temples rose on a high podium with a frontal porch and could house multiple cult statues in separate chambers in their cellas. After Rome's conquest of much of the Greek world, Roman temples adapted Greek architectural forms, ornament, and sculpture yet retained their high frontal character, with engaged columns flanking the cella. Unlike Greek temples, Roman sacred structures were not constructed purely of stone but instead were constructed with a brick and cement core covered with decorative stone revetment.

At the end of the Roman republic, wealthy and powerful senators sponsored sacred architecture both as gifts to the Roman people and for self-promotion. In order to circumvent sumptuary laws, Pompey constructed Rome's first permanent theater (55 BCE) ostensibly as part of a votive temple in thanks for his victories, although in reality the temple was a tiny appendage on the theater. In its courtyard, he displayed spoils from his conquests. Similarly, as the centerpiece of his Forum Iulium, Julius Caesar built a lavish temple to Venus, who also happened to be the divine ancestress of his *gens*.

Along with engineering projects, Roman sacred architecture was an important tool of imperial control. Mimicking Rome, significant provincial cities would have a *capitolium*, a temple

to dedicated to the Capitoline trinity (Jove, Juno, and Minerva). Cities vied to host a regional sanctuary dedicated to the cult of the deified emperors, modeled in form and ritual after temples to the gods. Cult statues of deified emperors could also cohabitate in temples originally built for local deities, and altars dedicated to the goddess Roma often usurped a structure's original altar, such as befell the Athenian Parthenon. As the empire expanded, the city of Rome integrated many foreign cults into its own sacred urban landscape, while in the provinces, communities provided local deities with temples that often merged classical forms with local traditions, such as the temple to Bel at Palmyra (ca. 32 CE).

In Rome and the provinces, entertainment venues such as theaters, amphitheaters, circuses, and baths carried religious connotations. For example, circuses not only contained a temple but were themselves considered sacred to the sun, with the chariot races symbolizing cosmic movement and the obelisks that graced the center representing the sun.

Early Christian Art

Early Christian art refers to the visual culture associated with Christian communities within and around the Roman empire from the first century CE through the decades following Constantine the Great's initial sponsorship of the religion (ca. 313 CE). Christian art and architecture changed radically over this period, paralleling

the fortunes of Christianity itself as it ascended from a persecuted and despised cult of slaves and foreigners to the religion of the Roman imperial court.

Although Christian communities multiplied in the first two centuries after Christ, Christians are virtually invisible in the archaeological record until the early third century. It is only from the Christian intelligentsia's elaborate literary attacks on traditional Roman polytheism that we have any evidence at all for the earliest Christian attitudes toward art. These authors waged an unrelenting war against art, with Tertullian even going so far as to credit Satan himself with creating painters and sculptors. Their animosity stemmed largely from art and architecture's service to pagan cult, yet despite these elite authors' polemics, most Christians used images in their daily life both as a necessity and a pleasure.

Only in the early third century does a distinctly Christian material culture begin to emerge as its adherents grew in size and social status. A limited number of private houses that converted to Christian cult activity are documented in Rome and the provinces; however, most evidence comes from the funerary arts, especially from underground networks of burial chambers called catacombs. In these chambers we find simple images similar to Clement's sealing rings that are joined by more complex figures, such as a shepherd or even such pagan gods as Dionysus or Orpheus who rose from the dead, all of which could symbolize Christ.

Later in the third century, narratives from the Old and New Testaments and images that specifically referred to Christian narratives and ritual begin to take shape. Christian artists adapted the same techniques, visual conventions, and often styles as the dominant visual culture of the region in which they lived. The Roman catacomb frescos portray Christ and the Prophets wearing senatorial togas to indicate their status; Moses and Christ perform miracles with a magic wand, and the twelve apostles recline next to Christ in the Last Supper as at a Roman *convivium*. Paralleling Christian tendencies to interpret the Bible typologically, with Old Testament events or figures presaging the New Testament, many catacomb frescos visually juxtapose stories from the two books.

Early Christian fresco depicts Moses striking water from the rock, Catacomb of Priscilla, Rome, Italy. (Scala/Art Resource, NY)

➤ CLEMENT OF ALEXANDRIA ON CHOOSING A FINGER RING

In instructing his congregation on buying a sealing ring, an object essential in antiquity for any legal or business transaction, the Church father, Clement of Alexandria (ca. 200), did not prohibit images altogether. In his work *Paedagogus*, Clement warns his flock that Christians must not choose a ring with images of the pagan gods, drinking cups, or a favorite prostitute, all popular options for non-Christians, but rather images with a potentially Christian significance: a dove, fish, or anchor. While early Christians did not produce a materially distinct visual culture in the first two centuries, this indicates that they cultivated a distinct usage and interpretation of mainstream Roman art.

—Matthew Canepa

Even at this early stage Christians thought that images could interact with the people or activities around them, a tendency that develops much greater complexity in the Byzantine period. From their placement near or even on the tombs of the deceased, frescos of miracles such as Moses crossing the Red Sea or Christ raising Lazarus enact a meaningful relation with their physical context and surrounding ritual activity, acting almost as guarantors of the tomb occupant's own

resurrection. Similarly, in the lively border city of Dura Europos in present-day Syria, frescos depicting the three Marys at Christ's empty tomb flank a baptismal font in a mid-third-century house-church. Here the image comments on the significance of the rite of baptism and the initiate's new hope for the afterlife.

Constantine the Great's patronage profoundly transformed Christian art and architecture. Christian iconography appropriated many elements of imperial iconography: clothing Christ in purple, encircling his head with a nimbus, and representing Him enthroned receiving gifts from foreign envoys (i.e., the Magi). In order to accommodate growing congregations and mark the empire with a distinctly Christian topography of power, Constantine funded massive building projects in the city of Rome and the Holy Land. With imperial funding, architects adapted many basic Roman architectural forms, such as the basilica and mausoleum, for new Christian uses as churches and shrines.

Early Hindu Art and Architecture

The sacrificial rituals of the Vedic period were performed in temporary structures for deities thought to be present though invisible. Therefore, the archaeological record is silent when it comes to the art and architecture of this time. Most likely, images and structures to house them were initially built from wood, thatch, and other ephemeral materials. It was not until artisans began working with stone and brick that we have surviving evidence of early art and architecture.

The earliest extant images are of fertility figures dating to the third century BCE. Most of these images were found in sites associated with Buddhism but represent a popular or folk religion likely shared with Hindus. For example, voluptuous female demigoddesses (*yakshis*) adorned the railings and gateways surrounding the Buddhist reliquary mounds of Sanchi and Bharut (second through first centuries BCE). Bas-reliefs of the Vedic gods Indra and Surya guard the doorway to a monks' cell in the rock-cut complex of Bhaja (mid-second century BCE). A few Hindu images have been found dating to the following centuries, but most of the extant art and architecture up until the fifth century CE was Buddhist. One of the few exceptions is a sandstone figure dating to the first or second century CE depicting the sun god Surya dressed in Scythian clothing and holding a short sword. There were two major styles during this period: the Greco-Roman-influenced Gandhara style in Pakistan and Afghanistan and the Mathura style in northwestern India. Later sculpture would integrate elements of both of these styles.

During the period of the Gupta dynasty (fourth through seventh centuries CE), Hindu art and architecture truly began to flourish. An inscription dated to 278 CE from Nagarjunakonda in Andhra Pradesh refers to a wooden statue of Vishnu, although the brick temple that housed it is no longer extant. The earliest extant Hindu temples are centuries older, but this inscription suggests the existence of no-longer-extant temples from the third century at the latest. All traditional Hindu temples functioned as a home for the deity rather than a space for congregational worship. From the earliest period, strict conventions governed the construction of temples and the carving of images. Hinduism developed an elaborate tradition of iconography. Gods and goddesses were frequently depicted with many arms, each holding an item typical of the deity. These had symbolic meaning and also served to identify the deity. Vishnu holds a conch and discus, for example, while Shiva holds a trident. The central image in a Shiva temple was almost always a pillar-shaped *linga*, representing the god in his most abstract form.

Art historians generally distinguish two styles of temples. The northern style was known

as the *nagara* style. The typical roof of a northern temple is shaped like a pyramid, and the towers tend to curve. The tower over the inner sanctuary tends to be the tallest. Sculptures on the outside of the temple frequently depict amorous couples. The *dravida* style of southern temples, in contrast, favors flat roofs, and the tower over the inner sanctum is often swarfed by towers marking gateways into the wall around the temple complex. The large temple complexes in the south often contain multiple secondary shrines and a large tank of water for ritual baths. The typical dravida temple tower is not curved and has clear horizontal bands of niches containing statues of gods, goddesses, saints, and scenes from mythology.

Both northern and southern temples share certain features. A temple's main deity is enshrined in an inner sanctuary, the *garbhagriha*. Smaller secondary shrines to other figures are common. Since the main images are immovable, temples generally contain a set of secondary processional images, often cast in bronze. Priests performed worship rituals for the images in the inner sanctuary, while visitors crowded forward to gaze upon the lavishly decorated image. *Darsan*, seeing the divine image, became a central feature of Hindu ritual from a very early period.

Early Buddhist Art and Architecture

Buddhist art received its initial impetus during the reign of Aśoka, the first Buddhist ruler of the Mauryan empire (273–232 BCE). Before the time of Aśoka, Buddhism was only one of many religious sects with followings in India, including Brahmanism (which would eventually develop into Hinduism), Jainism, and other, now-extinct *śramana* (striver) groups, such as the Ajivikas.

Standing Buddha Shakyamuni, from the ancient region of Gandhara, Pakistan, third century CE. Buddhist art from Gandhara is striking for its synthesis of a Hellenistic Greek style with Indic themes. (The Metropolitan Museum of Art/ Art Resource, NY)

With Aśoka's embrace of Buddhism and serious commitment to its teachings, the Buddhist community received levels of material support that it had not previously enjoyed. Although Aśoka did not support Buddhism to the exclusion of other traditions (donating cave monasteries, for example, to the Ajivikas), he did devote the bulk of his support to the Buddhist *sangha*, or monastic community, and to the promotion of Buddhist ideals through the construction of monuments and rock edicts.

Buddhist artworks attributed to Aśoka's direct support include the various pillars and monuments erected at Buddhist pilgrimage sites and the great stupa at Sanchi, in central India. The Buddhist pilgrimage sites had existed prior to the time of Aśoka. But Aśoka ensured that they were adorned with commemorative monuments. Such sites were associated with events in

the life of the Buddha and included the places of his birth, his attainment of nirvana, his first sermon, and his death (or *parinirvana*).

Probably the most remarkable Aśokan monument, though, from an artistic point of view is the great stupa at Sanchi. A stupa is a burial mound containing the physical remains, or relics, of a Buddhist saint (although Jain stupas were constructed as well). The shape of the stupa is suggestive of ancient Indo-European burial mounds erected over the remains of kings and warriors, a suggestion reinforced by the presence at the stupa of royal symbolism. The Sanchi stupa is crowned by a throne and an umbrella carved in stone. The throne is empty, as a symbol of the Buddha's absence from this world, having entered the state of nirvana and being free from *samsara*, the cycle of rebirth. This royal symbolism conveys not so much his status as a Kshatriya as his spiritual supremacy in general.

After the period of Aśoka, stupas remained prominent in Buddhist art. Over the course of time, the mound structure that formed the stupa's foundation became less prominent, while the umbrella mounted on the throne at the crown of the stupa became more prominent. The style of stupa with the prominent umbrella and small foundational mound structure was exported to Southeast Asia and eventually developed into the Chinese pagoda.

Because of their size, stupas are generally outdoor monuments. But smaller stupas were also constructed and housed in galleries in cave monasteries. There were even miniature stupas, presumably for the purpose of devotional worship in the home.

The stupa is typical of the artwork of the Aśokan period inasmuch as it does not include a realistic depiction of the human form of the Buddha. In this earliest phase of Buddhist art, the Buddha is only represented using abstract forms that symbolize his state of absence from the world. In addition to the empty throne, and of course the stupa itself, which, as a reliquary, is suggestive of former presence and current absence, there is also a representation in the form of the Buddha's footprints. The message of such imagery is clear: the Buddha was here, but now he is gone.

The religious sentiment of devotion, however, involves a longing for the presence of the sacred. Some scholars have speculated that a contributing factor to the rise of the Mahayana movement in Buddhism, which involves the idea of Buddha not as an absent teacher but as an omnipresent cosmic consciousness, might have been the practice of devotional rituals involving stupas and relics of the Buddha and of Buddhist saints.

Coinciding with the rise of Mahayana Buddhism in the second and first centuries BCE was the realistic representation of the human form of the Buddha. Such depictions are first associated with the Gandhara style of art. Gandhara, a region that today includes Afghanistan, was heavily influenced by Greek culture in the wake of the invasions of Alexander the Great. Gandhara Buddhas show strong Greek influence in the realism with which they depict the physical forms of their subjects.

The Gandhara style in turn influenced a style of sculpture that was associated with the northern Indian city of Mathura. The Mathura Buddhas are highly realistic, like the Gandhara Buddhas, but are also distinctively Indian. The Gandhara and Mathura styles continue to influence the representation of the Buddha to the present day.

When, in the wake of Aśoka's reign, patronage of Buddhism became popular in ancient India, wealthy donors endowed the Buddhist sangha with numerous cave dwellings. The term "cave" should not convey the impression that these dwellings were primitive. They were elaborately carved and adorned establishments that contain some of the greatest art treasures of the Indian subcontinent. The most famous of these cave establishments are at Ajanta and Ellora, both just north of the modern city of Mumbai (Bombay). In addition to many fabulous carvings, the walls of these dwellings are adorned with brightly colored frescoes depicting stories from the life and the past lives of the Buddha. These caves were expanded many times during the course of their existence. They were used by Brahmanical and Jain as well as Buddhist religious orders and contain many works of Hindu and Jain as well as Buddhist art.

Finally, another distinctive Buddhist art form to develop in early India was the mandala. Although associated primarily with later Indian Buddhism, the precursors of the mandala can be found in a variety of Buddhist art forms of the early period, including the stupa, of which, some have argued, it is a two-dimensional representation. Mandalas are depictions of the Buddhist cosmos, illustrating through a series of concentric circles the various stages of enlightenment and states of meditation. They are prominent today in Tibetan Buddhism and function as an aid to meditative visualization.

Pyramids of Mesoamerica and Transformation Images

Mesoamerican pyramids, like those of Egypt, had political and religious significance. Pyramids represented significant investments of time, energy, and symbolic capital. They were ostentatious representations of wealth dedicated to gods, ancestors, or elites. Their very presence proclaimed that the polity maintained continuity with its past (through ancestral veneration), that its present was still glorious (current construction efforts or upkeep), and that its future was bright (contemporary ceremonies and worship). A pyramid is simply a large solid structure with a stairway up the side(s) whose summit houses a religious or politically orientated structure. In Mesoamerica, pyramids were frequently renovated by adding a new facade to each side. After a few hundred years, the final structure hid several earlier versions under its facade. Occasionally, an earlier version was exceptionally well preserved, such as the Rosalila complex in Copan, Honduras. Pyramids were religious symbols as well. Every Mesoamerican city or village had its sacred edifice, and each household maintained its own worship space. The earliest

known pyramids in Mesoamerica were small structures dedicated to religious and astronomical rituals. Over time, the renovated structures eventually rivaled the pyramids of Egypt in size and ritual complexity.

Mortuary pyramids were a special kind of sacred space. These structures were dedicated for the mortal remains of prominent kings and their families. Often erected posthumously by the new ruler, the dedication of a pyramid was considered the pious duty of the prince in memory of his father. Stelae, or monuments, were set in front of the structure and proclaimed the deeds of the dead. For the ancient Maya, this dedication ceremony transformed the rock and mortar into sacred mountains where one could commune with spirits. The decorations within or around the mortuary temple also invoked the underworld and the maize god with resurrection motifs.

For Mesoamerican peoples, buildings were alive with the essence of supernatural entities because all things were charged with vital force. Caves, hills, and volcanoes each had special attributes and were associated with particular supernatural forces. Likewise, plants and animals had their own vital forces that were appeased, borrowed, or used for good and evil. Priests and rulers called upon these forces as necessary. The ancient Maya had a word for people with dual

➤ OF JAGUARS AND OLMECS

Matthew Stirling hypothesized that the prominence of were-jaguar motifs among the Olmec resulted from a belief that they conceived of themselves as children of the union of a jaguar and human female, giving them jaguar attributes. A stronger theory came from Peter Furst. He viewed jaguar-human images as shamanistic transformation, a process whereby shamans adopt jaguar attributes in their trances. Jaguars, as large top-tier carnivores in Central and South America, are believed to possess power that can be given to others. When Olmec shamans seek out their animal counterpart, they shed their human skin (metaphorically) and change into were-jaguars.

—Zachary Nelson

natures, *way* (pronounced “why”). The way was a spirit companion for an individual. Like a totem animal, the bearer would not kill any of his way-species for fear of killing himself. Stories are still told of shamans who as transformed jaguars received in their human forms any wounds that their animal forms incurred.

Similarly, kings and elites in Mesoamerica ritually impersonated a god and received its essence. Sacred objects, such as a god-image, were believed to have contained part of the divine essence. When humans clothed themselves with such objects, they absorbed a spark of the divine. This allowed them to ritually transform themselves into the object of adoration. Divine investiture of this form was common throughout Mesoamerica and played important roles in Mesoamerican society. For example, to reenact the origin of the sun, where the gods sacrificed themselves to make it move, slaves were transformed into deities through lengthy rituals and were then sacrificed, whereupon a noble or priest would be transformed into the resurrected aspect of the god. Thus, each myth could be faithfully reenacted by the original participants.

Transformation in Chavín Iconography

The broadly dispersed Chavín stylistic period during the latter half (900–200 BCE) of the Formative period of Peru may have resulted from the dissemination of a highly influential ideology or religious cult. The suspected shamanic

nature of this ideological system derives from the sculptural program at Chavín de Huántar, the presumed locus of such religious activity. The sculptural program, through illustrations of both psychotropic plants and their associated physiological reactions, suggests visual transformations from human to animal forms.

At the site of Chavín de Huántar in the north-central Andes, local sandstone and quartzite were carved in the round in the form of anthropomorphic, zoomorphic, and zoo-anthropomorphic heads. These sculpted heads were faceted as tenons set high into the walls of the monumental buildings at the site. Originally spaced in an even course about 32 feet (10 meters) above ground level, the heads would have appeared to float out from the building facades, far above the observer. The sculptures represent mostly feline, avian, and human faces; however, other forms appear among the surviving examples.

A few of the three-dimensional tenoned heads depict streams emanating from or plugs placed within flared nostrils. Based on ethnographic analogies, these nasal discharges possibly signified the flow of mucus resulting from the ingestion of hallucinogenic snuff. Sporting similar topknot hairdos, the tenoned heads may suggest the transformation of anthropomorphic figures to more zoomorphic forms through various stages from human to feline or avian counterparts. This sequence was arguably once structured around the building facade. Such visual transformations thus may have been a defining feature of the Chavín religious cult and ideology.

Other representations within Chavín iconography and material culture support the interpretation of transformation among the tenoned head sculptures. Ornately sculpted stone mortars, shaped as birds or felines with shallow central trays, suggest the processing of hallucinogenic snuffs from certain well-known tropical forest plants such as *Anadenanthera Colubrine* and *A. Colubrine*. Other hallucinogens, however, may have been consumed in beverage form. A high-relief sculpted piece from the Circular Plaza at Chavín de Huántar illustrates a zoo-anthropomorphic figure with feline-like fangs and claws carrying a San Pedro cactus. The San

Pedro cactus (*Trichocereus pachanoi*), common throughout the Peruvian Andes and still used by modern Peruvian shamans, produces a mild hallucinogenic reaction as a specially prepared drink. The figure holding the San Pedro cactus, with its prominent fangs and claws, stands in contrast to more anthropomorphic figures within the same sculptural program, which carry staves or seashells. The cactus-bearing individual may thus visually connect the cause and effect of alleged shamanic transformations in Chavín practice through the representation of a psychotropic ingredient in the hands of a zoo-anthropomorphic individual.

Snuff spoons and trays for the ingestion of hallucinogens nevertheless were present in the archaeological record prior to the establishment of Chavín de Huántar. The same may be said of images of feline, avian, and anthropomorphic figures and of San Pedro cacti in preceding Andean visual programs. The concept of transformation, its practice and representation, thus may not have been limited to the site of Chavín. Due to limitations in archaeological data, the accounts of transformation at Chavín de Huántar further draw heavily upon comparisons with modern Peruvian shamanic practices and ethnographic accounts. While stimulating in their application to the Chavín materials, such comparisons pose the problem of spatial and temporal disjunction. Analyses of Chavín iconography, with its representations of zoomorphic and zoo-anthropomor-

➤ A TENONED HEAD FROM CHAVÍN DE HUÁNTAR

This tenoned head is the only example that remains in situ. It protrudes from the west (back) wall of the main building at Chavín de Huántar. The stylized head displays a top knot, an upturned mouth with fangs, and a wrinkled nose with possible plugs in the nostrils.

Science and Technology

The exclamation “Eureka,” which can be translated from the Greek as “I have found it,” is most often credited to the Greek scientist Archimedes (ca. 287–ca. 212 BCE), a scientist often considered alongside of Galileo, Newton, and Einstein as one of the greatest thinkers in human history. The reason for Archimedes’ exclamation was his observation that water rose when he stepped into a bath. While this may not seem like a startling observation, for Archimedes that observation led to a fundamental mathematical discovery: how to identify the volume of irregularly shaped objects. Since the volume of water that was displaced was exactly equal to the volume of the object that was submerged, Archimedes reasoned that one could measure the volume of an irregularly shaped object by submerging it and measuring the displaced water. In his excitement at this observation, Archimedes supposedly jumped out of the bath and ran through the streets of ancient Syracuse naked, sharing his discovery (and much else) with the world.

While many scholars doubt the veracity of this tale, since it was first told nearly two centuries after Archimedes’ death in Vitruvius’s *On Architecture*, the amusing tale is illustrative of the types of fundamental scientific discoveries made in Greek times. Greek science is foundational to science as practiced today. While mathematics, physics, biology, chemistry, and astronomy all existed to some extent before Greek times, it is Greek civilization that establishes these areas of study as independent scientific disciplines.

What truly made this Greek science different is that these ancient scientists attempted to understand the world around them solely through recourse to the natural world. That is to say, what made Greek science unique in comparison to what had come before is that it was believed that the natural world could be explained without reference to gods, numinous forces, or other unobservable phenomena. This is not to say that the Greeks did not believe in the gods, numinous forces, or unobservable phenomena; they certainly did. Nor is it to say that Greek science was always independent of religion; the Pythagoreans, for example, were deeply mystical. However, Greek science was an intellectual endeavor founded on empiricism (observation and experience) with a heavy emphasis on reason (often scientific theories were exercises in reasoning devoid of systematic observation). The same could be said for Greek historical writing. Whereas earlier Greek writings such as the *Iliad* and *Odyssey* narrated a past in which the gods played a direct role, Greek historians such as Thucydides and Xenophon tried to explain the unfolding of history in purely human terms. Wars were

won and lost because of human actions, according to this viewpoint, not through the intervention of divine forces.

Greek science (other than medicine) can be thought of as developing in three stages. The first stage consists of the sixth-century Ionian Cosmologists, such as Thales of Miletus. Their approach was conceptual, theoretical, and logical and not based on empirical data, although they may have utilized Near Eastern records of astronomical/astrological observations. These scientists may be better thought of as philosophers or theoretical cosmologists. The second stage began with Aristotle, who could be safely called the father of empirical science in the Hellenic/Hellenistic world. His work was fundamental in much later science, especially in medieval Europe and Islam. Aristotle established a rigorous scientific method and bounded field of inquiry called natural philosophy. He classified living things, much as the Mesopotamians had but to a scale of detail that had not been achieved before. His observations on the movement of animate and inanimate objects, for example, gave rise to physics as an independent field of research. The third stage of Greek science builds heavily on Aristotle's work but occurs in the cosmopolitan setting of the Hellenistic age in which Mediterranean thinkers had access to the writings of Greek and Near Eastern scholars, the library of Alexandria being the most noteworthy institution that facilitated this. Astronomy in particular benefited from this fusion of Near Eastern and Greek science. The Near Eastern legacy of recording astronomical observations provided empirical data for the

Aristarchus of Samos (whom Nicolaus Copernicus cited in his 1543 CE work On the Revolutions of the Heavenly Spheres) had posited earlier in that century a heliocentric universe, but most Greeks (and others) who knew of his theory thought it was an impious idea.

type of Aristotelian reasoning that was well equipped to understand the nature of moving objects. Hipparchus of Nicaea (in Anatolia), for example, established in the second century BCE the astronomical system later popularized by Ptolemy. Aristarchus of Samos (whom Nicolaus Copernicus cited in his 1543 CE work *On the Revolutions of the Heavenly Spheres*) had posited earlier in that century a heliocentric universe, but most Greeks (and others) who knew of his theory thought it

was an impious idea. Alexandria, and Hellenistic science in general, was the location of a rich cross-fertilization of ideas and data (derived from diverse cultures and time periods) that were utilized by scholars from varied regions and backgrounds.

The Greeks were not the only people in the period from 1000 BCE to 300 CE who were interested in science and technology. The astronomy that was practiced in India during this period was based somewhat on earlier Mesopotamian practices and was as dependent on mathematical principles as Greek astronomy. The Chinese used mechanical celestial globes to assist in identifying heavenly bodies and charting their movements. The invention of the abacus, which occurred sometime in the first millennium BCE, certainly assisted in Chinese astronomical calculations. Mesoamerican astronomy was also rigorous, though it developed independently of the practices in Meso-

potamia, Greece, and India. While most evidence for Mesoamerican astronomy comes from later periods, town plans were oriented along precise astronomical coordinates, consistent with Mesoamerican views of the layout of the cosmos.

Mesoamerican construction and engineering was also elaborate, and much of it was based on highly developed skills in the exploitation of stone. The Olmecs were able to move large stones long distances and were experts in stone carving. The burgeoning Maya cites and the large center of Teotihuacan (near modern-day Mexico City) featured monumental and sophisticated architecture. The Maya used what is called a corbel arch (or false arch since no key stone is used) as a means of spanning vaults and entrances; this architectural feature had become nearly universal in Maya engineering by about 250 CE.

The Romans were also extraordinary engineers, as is attested by the numerous Roman buildings that still dot the European and Mediterranean countryside to this day. The Flavian Amphitheatre (better known as the Coliseum) and the Pantheon, both in Rome, remain marvels of architectural and engineering achievement to this day. Roman towns throughout the empire had similar, though usually less elaborate, architectural features. Two of the main components of Roman building were concrete and arches. Neither were invented by the Romans (both were used in ancient Mesopotamia), but the Romans did develop means of using them more effectively.

Chinese engineering between 1000 BCE and 300 CE is also noteworthy. Many of the principles of Chinese architecture that were established during the Han dynasty remained fundamental in Chinese design until the nineteenth century. The ability to construct long walls over difficult terrain reached its pinnacle in the construction of a great wall by the Qin dynasty that acted as a defensive wall. The later Ming dynasty resurrected this idea of a great wall, and today's visitors to the Great Wall in China mostly see the Ming structure. One of the first instruments used to understand earthquakes was developed in China, perhaps as early as the second century CE. The Houfeng Didong Yi, as it was called, was used to identify when an earthquake had happened and in which direction. Arguably one of the most influential Chinese contributions to the earth sciences was in cartography, particularly the development of rectangular grids and graduated scales that allow for accurate estimations of distance between locations. Pei Xiu (224–271) is usually credited with developing this, but he may have based his rectangular grid off of the maps of Zhang Heng (78–139).

New water-management technologies that appeared from 1000 BCE to 300 CE allowed previously marginal areas to be better exploited by humans. Long aqueducts, which were designed to bring water directly into a Roman city, allowed Roman cities to utilize water supplies from farther off and to provide enough water to run the public baths. A system of underground irrigation channels called *karez* in Persian or *qanat* in Arabic allowed much of the arid regions of central Asia to be cultivated and was employed by the Persians, the Chinese (starting in the Han dynasty), and others living in arid parts of Asia. Ma Jun, a mechanical engineer who lived in China (ca. 200–265 CE), is said

to have developed a chain pump that allowed palace gardens to be watered. Agricultural science became more theoretical in 1000 BCE–300 CE, especially in Roman times. The agricultural manuals of Cato and Varro, written in the first century CE, provided Roman aristocrats with practical advice on farming, especially concerning soil-related issues.

Science in the period from 1000 BCE to 300 CE was not just oriented toward the study of the world around humans. Ancient approaches to the study of humans in medicine and anatomy set the stage for how medicine has been practiced throughout Europe and Asia to the present. Indian Vedic texts from this period see illness as a consequence of sin or from the actions of demons or other spirits, much in the same way that the Mesopotamians understood sickness. Yet collections of medical texts from India that date to this period indicate a sophisticated knowledge of surgical procedures and a wide array of surgical tools. One particular surgical approach that was common in the Americas as well as in Asia and Europe at this time is trepanning (or trephination), which involved the drilling of holes into the skull. Archaeological evidence for this practice comes in the form of skulls with neat holes cut into them.

Theories of medicine were developed in both China and the Hellenistic world between 1000 BCE and 300 CE. Traditional Chinese medicine was heavily influenced by the Yellow Emperor's *Classic of Internal Medicine*, which was compiled and edited during the Han period and posits that ill health is caused by a variety of natural factors, such as environment, diet, and lifestyle, and not through magical influences. In this work the body is seen as mirroring the cosmos, and through understanding natural forces a person can achieve good health. These ideas are best contextualized within the larger framework of Daoist and Confucian ideas. The practical application of these philosophical principles manifested itself in acupuncture and herbal medicine. Indian Vedic medicine likewise saw the body as a microcosm of the cosmos, and some medical collections similarly emphasize the necessity for balance in bodily elements (although, as already mentioned, magic and sin were also seen as root causes).

Hellenic medical theory was also informed by philosophical principles and likewise rejected magical explanations as the causes of disease. Like Chinese medicine, Greek medicine emphasized the necessity of balance in the body (especially of fluids they called humors) and saw disease as caused by an imbalance of these fluids. Hippocrates, a semilegendary physician from the island of Cos, is the most well known of the ancient Hellenic healers. He and his colleagues practiced a form of medicine that emphasized careful observation, and the practices became widely known throughout the Greek world. After Hippocrates' death, his status became more legendary, and he came to be revered as the father of scientific medicine. Numerous treatises on medicine were ascribed to him, and these and perhaps some of his own works (although no one is sure which, if any, were actually written by him) were collected as the *Hippocratic Corpus*.

—Kevin M. McGeough

■ Introduction: Understanding the Physical World

The period from 1000 BCE to 300 CE was a Classical age of science. It was at this time that the cosmological conceptions of the world were established that would be fundamental until the spread of Western science after the Enlightenment.

Western science can draw direct connections to the science of the Greeks, who took the Mesopotamian scientific methods of careful observation and divorced it from theology. Thus, the Greeks were the first scientists to attempt to understand the natural world through recourse to explanations derived from the natural world (as opposed to looking for divine or religious explanations).

Scientists in India also used the insights of ancient Mesopotamian scientists but did not attempt to understand the natural world as divorced from the gods. This is most apparent in Indian astronomy/astrology, which was based on Mesopotamian methods and rigorous observation but fused with Vedic theology.

Chinese attempts to understand the world began long before this period. However, the philosophies of Confucianism and Daoism that emerged under the Eastern Zhou dynasty (771–256 BCE) carried with them particular understandings of the ways in which the natural world operated and established some of the basic tenets of Chinese science.

Mesoamerican attempts to understand the universe manifested in an incredibly complex (and accurate) calendar. The calendar seems to have developed before 600 BCE and provided the foundations for the Maya and Aztec calendars that are still in use (by some communities) today. This calendar was a means not just of keeping track of time but also of predicting future events. Because time was seen as cyclical, the function of a calendar was to keep track of recurring events and thus help people prepare for them.

—Kevin M. McGeough

Ionian Physicists

The Ionian physicists (also known as the Milesian School) are Thales (sixth century BCE), Anaxi-

mander (610–546 BCE), and Anaximenes (ca. 545 BCE), all from Miletus in Ionia (Asia Minor). The tradition is that Thales taught Anaximander who in turn taught Anaximenes. The cosmos and physical phenomena in it, not other areas of philosophy, were their primary interest. Strangely (to us), they did not clearly distinguish material things (such as air) from qualities (such as hot) or from forces (such as heat). All were monists, positing one basic physical stuff of the world.

For Thales, the first philosopher, we have no surviving writings or even contemporary accounts of his thought. Through secondhand accounts we know that he claimed that water was the basic stuff of the world, the first nonmythological and nondivine natural explanation of the world, and included details such as that the earth is a flat disk floating in water.

Known as the father of geometry, Thales probably learned mathematics and astronomy from the Babylonian tradition but distinguished himself by offering explanations in addition to observations (e.g., of an eclipse), practical applications (e.g., determining distances ship to shore), theoretical formulations, and perhaps mathematical advances.

Roman mosaic depicts Anaximander of Miletus holding a sundial. (AAAC/Topham/The Image Works)

► THE SOLE SURVIVING FRAGMENT OF ANAXIMANDER

“The Non-limited is the original material of existing things; further, the source from which existing things derive their existence is also that to which they return at their destruction, according to necessity; for they give justice and make reparation to one another for their injustice, according to the arrangement of Time.”

—Jacques Bailly

Source

The sole surviving fragment of Anaximander, found in Simplicius's *Commentary on Aristotle's Physics* 24.18–21, translated by Kathleen Freeman, *Ancilla to the Pre-Socratic Philosophers* (Cambridge: Harvard University Press, 1948), 19.

Variety and disparity in the myths of more advanced neighbors probably led him to start anew at explaining the world, rejecting myth as an explanation. His chief importance is the value of simplicity and reduction in explanations and his rejection of divinity as explanatory.

One sentence survives of Anaximander's own words, quoted by Simplicius; again, all is second-hand. He held that the basic stuff was “*to apeiron*” (the unlimited), a primitive unified stuff infinite and qualityless and probably divine (immortal and powerful). Somehow, within the *apeiron* hot and cold/wet arose and conflicted. In their conflict, which created the cosmos, the cold/wet partially dried (earth), partially evaporated (mist and air), and partially remained (water). The heavens are the hot split up by the evaporation of wet/cold into rings surrounded by mist with holes through which the hot is visible as the sun, moon, stars, etc. He suggested that there was no natural up or down, so the earth had no need to be supported by anything, and he created a geometric model of the universe, including a map of the earth and the heavens. He claimed that life emerged from the sea and that eventually everything will return to the *apeiron* to justly pay for the original conflict of hot and cold/wet.

Several quotations of Anaximenes' own words survive. A material monist, he said that the basic

stuff was air (including vapor), which was perpetually moving. His mechanical explanation of the apparent diversity of the world as density variations (hot and dry = rarefied; wet and cold = dense) includes two important scientific innovations: quantitative differences explaining qualitative differences and conservation through change.

Aristotle

Perhaps the world's first scientist, Aristotle favored observation over theory. Much of his corpus, particularly the bioscientific works, consists of careful observation of phenomena, from insects to humans. His scientific works are now of historical interest. His philosophical system, however, and his careful observations about other things, such as constitutions and literature, retain more than historical interest.

Aristotle's philosophy is hylomorphic: physical things consist of matter (*hyl-*), which is potentially something, and form (*morph-*), which combined with matter are the things in the world. Rover, for example, is tissue (matter) combined with dogginess (form). Individual physical things, especially living beings (which are Aristotle's usual examples), are substances. Individuals such as Rover are primary substances. Primary substances are the bedrock of reality for Aristotle: they exist independently, while nonsubstances exist dependently on substances. Rover, considered as a hylomorphic entity, belongs to an *infima* species (lowest species), dog, which is his form. Forms are secondary substances. Secondary substances depend on primary substances for existence (contrary to Plato's forms, which are the bedrock of his reality, are separate from things and make things what they are). The species dog belongs to a genus (call it mammal), which is also a secondary substance. The genus mammal is a species, however, relative to its genus, animal. Species are defined by differentia, which differentiate one species from another in

the same genus. A differentia is part of a thing's essence, which is a thing's account or definition that includes all the differentia of the infima species and higher to which a thing belongs.

All other things are nonsubstances and can be allotted to the following categories: qualities, quantities, whens, wheres, relationships, positions, activities, passivities, and wearings (e.g., of clothes). A few things, such as being, unity, and goodness, cannot be simply allotted to one of those categories. They apply in different ways to every category, including substances, and are the subject of Aristotle's metaphysics.

Aristotle finds four appropriate ways to answer the question "Why is that an X?": the material constituents, the form, the thing that mechanically brought X about, and what X is for. Those answers correspond to the four Aristotelian causes (or explanations): material, formal, efficient, and final. The form of Rover is dog; the matter is flesh, bones, sinew, etc.; the efficient cause is his father and mother; the final cause is what dogs are for.

Aristotle analyzed change as a different actualization of a potential: the substance remains the same through change of its nonsubstance accidents. In substantial change, however, the matter remains, while the form changes. Thus, Rover's matter remains when Rover dies, but it is no longer Rover: his form is gone, and that matter has different form(s).

A substance's form (and matter) has practical and theoretical consequences. Humans, for instance, are both rational and political in the account of their form, their nature/essence. Not all are fully rational, but the human who has reached humanity's goal of becoming fully human is fully rational. Humans who fall far short of that goal cannot deliberate about ends; they can only deliberate about means to ends. Aristotle famously said that such humans are natural slaves (to the fully rational humans). Fortunately, Aristotelians can pluck that and other repulsive ideas (e.g., that women are inferior) out and leave Aristotle's system virtually intact. As for their political nature, it leads humans to form groupings, the natural end of which Aristotle identified as the Greek city-state, or polis, a natural goal because the polis allows humans to fully develop their nature, to

➤ ARISTOTLE ON THE SCIENCE OF NATURE

The opening sentences of Aristotle's *Physics* are:

"In every line of inquiry into something that has principles or causes or elements, we achieve knowledge—that is, scientific knowledge—by knowing them; for we think we know a thing when we know its primary causes and primary principles, all the way to its elements. Clearly, then, it is also true in the science of nature that our first task is to determine the principles."

—Jacques Bailly

Source

Physics 1.1 in *Aristotle: Selections*, translated by Terence Irwin and Gail Fine (Indianapolis: Hackett, 1995), 83.

achieve the excellences of their nature as humans, and it grows from other groupings. Outside of a polis, certain human excellences are unattainable. For Aristotle, individual human excellences, or virtues, are lasting states that are means between extremes.

Aristotle was Macedonian by origin and spent 20 years at Plato's Academy in Athens and left after Plato died in 347 BCE. Aristotle returned to Athens to found the Lyceum school, but after his fellow Macedonian and former pupil Alexander the Great died in 323, he left Athens and died within a year.

Aristotle's surviving writings are his collected papers (unpublished in his lifetime and consisting of 2,500 densely packed pages) and represent perhaps 20 percent of his lifetime output. They are honest and careful efforts to explicate his own ideas. They are never easy to read and often contain inconsistencies, puzzles, and apparent contradictions, many of which he was aware of. Nonetheless, they add up to an admirable effort of a philosophical system. Although often our best source for his predecessors' thought, he was not a historian of philosophy, and care is necessary in using him as a historical source.

Aristotelianism in various areas has been a dominant stream in philosophical thought continuously from Aristotle's time on.

Early Indian Astronomical Texts

Jyotis is the science of astronomy, and texts on astronomy are called *jyotishshastra* in Sanskrit. As one of the limbs of the Veda, *jyotis* was the science of determining the movement of the heavens for the sake of Vedic ritual. The cosmos itself was thought to reflect the ritual, which had to be performed at certain times and oriented correctly with respect to direction. Divination of appropriate times to begin undertakings and interpreting celestial omens were other uses of *jyotis*. Despite the necessity of astronomy and mathematics for Vedic rituals, the Indian traditions benefited from the infusion of methods from the neighboring Babylonian civilization.

The *Jyotissavedanga* of Lagadha is the oldest text on *jyotis*, and it most likely dates to 400 BCE. It declares that astronomy is the science of determining time and, in particular, the proper times for the Vedic sacrifices. The text describes the annual motions of the sun and moon as well as the *naksatras*, the 27 divisions of the sky through which these bodies pass.

Mathematics (*ganita*) was an indispensable discipline for astronomy as well as for the performance of the Vedic rituals. *Sulva Sutras* were texts describing the proper geometric layout for Vedic ritual altars. Mathematics of right-handed triangles as well as methods of calculating area ensured the correct layering of altar bricks. Similarly, these texts described how to measure the cardinal directions for orienting the altar. This class of literature developed from about 500 BCE until the advent of the Common Era.

The most significant discovery in Indian mathematical astronomy was the invention of the number zero. From India, it spread into Greek and Arabic mathematical systems. The numeral used was originally a dot (.), which acted as a placeholder. In Sanskrit, the word used for this was *shunya*, a term referring to a hole or a cavity, an etymology important for the development of the now-familiar shape of the numeral zero (0).

In the early centuries of the Common Era, astrology and the interpretation of omens grew in importance. The *Gargasambhita*, dating to within a century of the advent of the Common Era, was a text on omens that describes various celestial phenomena and interprets their meanings. The *Yavanajataka* of Sphujidhvaja is an important third-century CE text dealing with both astronomy and astrology. It contains an updated planetary theory for more accurately predicting planetary motions as well as descriptions of the signs of the zodiac (*rashi*) and the astrological influence of the planets. It also contains instructions for divining the best times to initiate undertakings.

Babylonian and Greek systems of astronomy influenced many of these texts. Lagadha's *Jyotissavedanga*, for example, relied on methods from Babylonian sources that allowed the construction of more accurate calendars. Methods of divination and horoscopy reflect Babylonian omens, and much of the *Yavanajataka* is based on a second-century CE Greco-Babylonian text from Alexandria.

Mesoamerican Calendar System

The Mesoamerican calendar system was one of the most intricate of the ancient world. Developed before 600 BCE, it is still in use today by day keepers in isolated villages and increasing because of the New Age movement. In particular, the Maya and Aztec calendars are well known and share many common features. The Gregorian calendar is based on a solar year, or one revolution around the sun. This 365-day cycle does not quite approximate a full solar year, so every four years a leap day is included as February 29. In addition, we use a lunar calendar for certain holidays, to measure tides, and for references to fertility patterns. All of these concepts were familiar to the ancient Maya.

Calendars mark repeating cycles. Each revolution of the earth is a day, and each revolution of the earth around the sun is a year. For ancient cultures, these patterns were harbingers. Time was not a linear function but rather a cyclical function. Events repeated themselves and were identified by their attributes on that day. Thus, a bad harvest year was expected to come around again and again, according to its period. It was very important for the ancient Mesoamericans to know when to expect calamities, hurricanes, earthquakes, good fortune, and even romance. Thus, the ancient Mesoamericans developed calendars whose interconnections foretold events and predicted the future based upon the past.

The numeric notation of the ancient Maya was vigesimal (base 20), not decimal (base 10). Rather than count with just fingers, they included toes. In fact, the word for “man” and “20” are the same, “uinic.” The Maya used a single dot for 1, a bar for 5, and glyphs for 20 and larger units. Thus, 34 would be written as uinic, 2 bars

and 4 dots. They also recognized zero as a concept, representing it hieroglyphically as a shell in their notation. However, the ancient Maya loved to use variants in their writings. They interchanged numbers for god-face equivalents whenever possible.

Divination was very important to ancient peoples, and Mesoamericans were no exception. Their 260-day calendar, often called *tzolkin* in the literature, was used to predict outcomes and to understand repeating cycles. Perhaps originally based on the duration of human gestation, this calendar was used to name children, understand their attributes (based on their birthday), as an oracle for activities (including waging war and peace), and as a means of knowing which god was responsible for which day’s events. The almanac was composed of 20 day names with 13 day numbers in an endless repeating cycle.

Mesoamericans also used a solar year. This 365-day calendar was divided into 18 “months” of 20 days each, with 5 unlucky days at the end

➤ END OF THE WORLD AS WE KNOW IT?

December 21, 2012, marks the completion of current baktun. In Maya calendrics, this is equivalent to a millennial event. For most of the world, it will be a nonevent. However, for the growing body of New Age adherents, this day could be highly significant. It will not be the end of the Maya long count, which just accumulates days for infinity. But this date reset the commonly used coefficients to effectively 0.0.0.0.0.

While the ancient Maya were more concerned with past events than future events in their monuments, New Age Maya enthusiasts look forward to this date as a culmination of the calendar and expect significant changes to occur. For instance, Web sites dedicated to 2012 abound with great expectations. Earth may join an extraterrestrial league of planets. It might be destroyed. A shift in the galactic beam could occur. Modern Maya will take over the earth. Atlantis will surface, ushering in an era of supernal consciousness. Most of the claimants have only token knowledge of ancient Maya practices. Few of them read any of the several hundred Mayan languages. A couple of shamans claim to channel the vital force of past Maya kings. Others pick up vibes from their Maya DNA.

Whatever the claim, it is unlikely that archaeologists will uncover something more significant about that date than is known already: The lower coefficients of the long count turn over, and this occurs on a winter solstice in the Northern Hemisphere. On the other hand, Tikal, Guatemala, is well worth exploring, especially when it is cold up north.

—Zachary Nelson

(Uayeb). They did not use a leap year to realign the calendar, which means that New Year's Day gradually moved. For the Maya, the first day of the year was "1 Pop." The solar year was also referred to as the "Vague Year" or "haab" since it only approximates an actual revolution of the sun.

The intersection of the 260-day almanac and the solar year was called a calendar round. For a given date, it required 52 years of 365 days to repeat. Beginning this great cycle was a cause of celebration among the Aztec when the New Fire was ceremonially kindled.

Longer durations of time required a different calendric approach. Rather than relative time (i.e., based upon a king's reign), sometime early

in Maya history (before 600 BCE) they devised the long count. Similar to the concept "Before Common Era" and "Common Era," this calendar counts up from a mythological origin of August 11, 3114 BCE. This count was based on a vigesimal system of 20 days (rather than our decimal system). Each day was called "kin." Twenty kin was a uinal. Every 360 days equaled a tun. Twenty tun equaled a katun, or approximately 20 years. Twenty katun equaled a baktun, or roughly 400 years. Even larger units are known. The notation for a long count is written biggest unit to smallest, (i.e., baktun, katuns, tuns, uinals, kin). Where place holders were required, the Maya used their term for zero. The ancient Maya celebrated katun and half-katun endings. Often, this celebration involved feasts, dancing, and erecting monuments dedicated to the king.

The ancient Maya also kept track of the moon and its eclipses. In the inscriptions, the lunar information was known as the Supplementary Series. Moon age was counted from the new moon's first occurrence and rounded to whole numbers (i.e., 29 or 30). Over long periods, the Maya achieved a high degree of accuracy with their lunation cycles, accurate to three decimal places. The movement of the moon was important in predicting eclipses, which the Maya dreaded. Terrible things occurred when the sun hid itself unexpectedly, and they were able to predict such occurrences.

Astronomy was also important to the ancient Maya. In particular, they paid attention to the brightest of the wanderers, Venus. Venus appeared as a morning star for 236 days and then disappeared from their view for 90 days. It reappeared as an evening star for 250 days and then disappeared again for 8 days before beginning the cycle over. These movements were carefully tallied by the ancient Maya and were related to unfortunate events, such as warfare. About every two calendar rounds, the Venus cycle, the 260-day almanac, and the 365-day calendar would align.

Early Astronomy in Mesoamerica

Early astronomy in Mesoamerica was closely related to the vision of cosmic order, and the stars were associated with the sacred domain of existence. Deities were associated with stars, satellites, and planets, and their movements were registered in calendars that determined the ritual and daily aspects of life. According to the sixteenth-century Codex Vaticaniano-Rios, the people of Mesoamerica envisioned various celestial strata or layers in the sky, each with its own deities, dwellers, and attributes. For instance, the Maya from the Yucatan Peninsula considered seven superimposed celestial layers held by an evergreen Ceiba tree emerging from the center of the earth plus another four of these trees for each corner of a square cosmological model. Another variation was the representation of the sky as a gigantic celestial dragon formed by bands of stars and astral symbols.

Early astronomers in Mesoamerica perceived the apparent movement of the celestial vault and registered directions and patterns. The cosmic directions were identified with crosslike designs, and specific colors, deities, trees, and birds were associated with each of these directions. Therefore, the sky introduced a sacred order related to landmarks and symbols. The astronomical orientation of buildings could also create Hierofanies (an illumination of the sacred), whereby on specific dates and at a specific time the sun would create patterns of light and shadows or illuminate an underground chamber.

By far the most relevant star in Mesoamerican astronomy was the sun, which was central in tracking the rain cycles and dry seasons. It also served as a strategic guidepost for the economic subsistence of the largely agricultural society in Mesoamerica, and hence an accurate record of the solstices, equinoxes, and zenithal passes was put in place. Another important astronomical event in Mesoamerica cultures was when the sun would appear directly above the

observer in an exact vertical line, therefore projecting no shadows. This phenomenon is known as the zenithal pass and can be observed twice a year in places located around 23.5° N and S. For this end, special zenithal chambers were built in Montealban, Teotihuacan, and Xochicalco. The chambers were built as underground compartments where the sunrays pass through a cylindrical chimneylike duct, illuminating the chamber on the predicted day. The observation of the sun's cycle was key to Mesoamerican ceremonies and laid the origin of the ritual calendar. This calendar was known as *tonalpohualli* among the Nahuas and *tzolkin* among the Maya and held ritual and divinatory significance for marking festivities and ceremonies.

The moon was regarded as the feminine principle and the element of change in Mesoamerican cosmology. The lunar cycles and their relationships with eclipses were recorded in a particularly accurate fashion since the prediction of these events signified a powerful demonstration of the ruling classes' powerful scientific wisdom.

The observation of other stars and planets such as Venus was important enough to erect imposing architectural structures. According to archaeoastronomer John B. Carlson, the cult of the planet Venus that determined wars and human sacrifices elsewhere in Mesoamerica was prominent at Teotihuacan. Ceremonial rituals were timed with the appearance of Venus as the morning and evening star, and the symbol of Venus appears whether as a star or half star with a full or half circle. In Teotihuacan, priests embodied religious as well as scientific knowledge since they were in charge of predicting eclipses, meteorological forecasts, and epiphanies as well as performing rituals and ceremonies. The core of the urban complex was the Pyramid of the Sun, which stands atop a sacred cave representing the fundamental creation. The pyramid was aligned with the rising of the sun and the appearance of the Pleiades at the spring equinox. It was designed for astronomical observations, worship, and sacrifice. Astronomical devices known as pecked crosses were common in Teotihuacan. These markers were designs pecked on rocks or impressed in plaster floors and include rectangles, Maltese crosses, and other forms, but many consist of a cross and two

concentric circles. Among the first found at Teotihuacan were a pair, several kilometers apart, that formed a perpendicular to the Avenue of the Dead, suggesting that they were important in astronomical alignments and for the city planning layout.

Data for other heavenly bodies was also recorded, such as Mars's synodic cycle (depicted in the Dresden codex), the conjunctions and alignments of stars, and constellations. Among the latest, the Pleiades were known among the Nahuas as Tianquitzly (open market) or Miec (crowd) and also the constellations of Colotl (Scorpio), Citlaltachtli (Gemini), Xonecuilli (Orse Major), Citlalin Popoca (comets), and Citlalin Tlamina (falling stars).

The identification of astronomical cycles, patterns, and events not only indicate the scientific

relevance of their observations but also reveal a solid link between astronomy and astrological symbolism. The celestial phenomena were always related to the rise and fall of rulers, a battle's fate, and major natural disasters. The importance of the observatories was not only astronomical but also had ritual and divinatory purposes.

■ Introduction: Treating the Abstract—Mathematics

Western students of mathematics quickly become aware of the Greek foundations of modern mathematical inquiry when they first learn the letters of the Greek alphabet that are still used in mathematical expressions. For Western mathematicians, Greek mathematicians are the classical masters, and although these works have been superseded in current times, these ancients are still treated with reverence. Although the Greeks built their own discoveries on those of the Egyptians and Mesopotamians, Greek mathematics took the science in new directions, especially in its ability to function as a means of thinking abstractly.

The Greeks were not the only mathematicians living from 1000 BCE to 300 CE. The people of Mesoamerica, with their elaborate calendar, were clearly skilled at using numbers to problem solve. Indian astronomers were also adept at mathematical calculations. In fact, many fundamental mathematical discoveries were made in India.

—Kevin M. McGeough

Indian Discoveries in Mathematics

Indian scholars, working largely within Hindu religious traditions, made a number of significant contributions to mathematics. The cultural and social structures of the Hindu religion provided both a unified structure and a means of dissemination for this mathematical work. India was located at the crossroads of a number of major trading routes, which allowed Indian scholars in the later period to influence (and be influenced by) mathematicians in China, Rome, and Persia.

The roots of mathematics in Indian culture can be found in the Vedas, the sacred texts of the Hindu religion. In terms of the history of mathematics, the most important content in the Vedas is a set of ritual instructions for priests. Many of the ceremonies described in the Vedic texts involve ritual sacrifices, which require not only precise knowledge of the right day and time for the sacrifice to occur but also precise construction of a sacrificial altar. For this reason, mathematical computation and astronomical ob-

servation were both given high positions of honor in the priestly traditions.

The Sulva Sutras, written mostly between 800 and 500 BCE, are the portion of the Vedic literature that deals with ritual measurements. The sutra was a common form of proverb or instruction in the Vedic texts, and the word “sulva” refers to a rope or cord; the Sulva Sutras are a series of instructions for using a simple rope to construct a geometrically precise ritual altar. Ritual altars were not simple objects, and the priests who used the Sulva Sutras needed not only to be able to construct altars of different shapes and dimensions but also in some cases to locate them along specific geographical orientations or astronomical sight lines.

The Sulva Sutras, which were intended to be religious manuals, contained an impressive amount of practical geometric and algebraic knowledge. Some of the later Sulva Sutras incorporate technological advances such as gnomons or measuring tapes, but even the older ones, which rely on nothing more complicated than simple sticks and cords, describe a fairly advanced functional mathematics. In the process of describing procedures for constructing these altars, the Sulva Sutras include general solutions for problems such as rectilinear transformations, squaring the circle, and solving first- and second-order indeterminate equations, along with a general formulation of the relationship between the lengths of the sides of a right triangle (commonly known today as the Pythagorean theorem). Indian geometry, as contained within the Vedic texts, is considered a primarily empirical base of knowledge because it relies on general rules rather than the formalized proofs that were prioritized by Greek and Greco-Roman mathematicians. Even considered as an empirical or functional body of knowledge, though, the understanding of geometry in the Vedic texts is comparable to mathematical knowledge in other cultures during this time period. In addition to this functional geometric content, the Vedic texts include extended discussions of very large numbers, discussions that cannot reasonably be said to have any functional or practical utility and are often taken as an indicator of the playfulness and inventiveness of Indian mathematicians.

Toward the end of the Vedic period, Indian mathematicians came into contact with Greek and Mesopotamian ideas about mathematics. The next phase in the development of Indian mathematics is described in another set of religious writings, the Siddhantas. Inspired partly by increased demand for navigational accuracy and partly by contact with other civilizations, the Siddhantas focus primarily on astronomical concepts such as the motions of heavenly bodies. The mathematical content of the Siddhantic writings consists mainly of trigonometry and includes some significant advances on the Ptolemaic trigonometry believed to have inspired them. In particular, the first expression of general rules for calculating sine relationships appears in one of these later Siddhantas.

Greek and Roman Mathematics

From 600 BCE to 600 CE, several varieties of mathematics developed in the area bordering the Mediterranean Sea, some of which have a great deal in common with the mathematics developed in other times and places and one—the Euclidean tradition in geometry—that was unprecedented and exercised a powerful hold over the imagination of the Christian and Muslim

▶ A MAP BASED ON PTOLEMY'S GEOGRAPHY

A fifteenth-century map of the world constructed according to the information given in Ptolemy's *Geography* 1,100 years earlier.

Ptolemy was dependent on reports of travelers and their accounts of travel times for the locations he assigned to important cities. It is not surprising that the map of Asia and southern Africa is highly inaccurate. On the contrary, what is surprising is the ease with which one recognizes nearly all of Europe, the Mediterranean Sea, and northern Africa.

(Erich Lessing/Art Resource, NY)

—Roger Cooke

civilizations that inherited it after the breakup of the Roman empire. This history can be divided into three very unequal periods: the Hellenic period (from 600 BCE to 300 BCE), the Hellenistic century (from 300 BCE to 200 BCE), and the Roman period (from 200 BCE to 600 CE). Even in the Roman period, nearly all mathematical work was written in Greek.

During the sixth century the Ionian philosophers Thales and Pythagoras systematized some geometry and number theory. According to a work ascribed to Aristotle's pupil Eudemus and quoted by the Neoplatonist Proclus 750 years after Aristotle, Thales knew certain abstract geometric relations about triangles and circles that go beyond mere measurement of lengths and areas, which were the primary concern of earlier mathematical work. Pythagoras, despite his association with the geometric theorem that bears his name, certainly did not discover this theorem and probably did not prove it. He and his followers were more interested in the mystical properties of numbers than in geometry. The basic structure and content of what became Euclidean geometry was worked out, largely in Athens, in the fifth and fourth centuries BCE.

After the death of Alexander in 322, leadership in mathematical research passed from Athens to Alexandria in Egypt. There around the year 300 Euclid wrote his *Elements*, which con-

tains a deductive development of plane and solid geometry and parts of elementary number theory. Euclid's work was soon followed by more advanced geometry, the high-water mark of which was the work of Archimedes embracing both pure geometry and mechanics and Apollonius's treatise on conic sections. Both of these mathematicians had studied in Alexandria, although Archimedes lived in Sicily and Apollonius in Pergamum (now Bergama, Turkey).

The Golden Age of Euclidean geometry came to an end with the death of Archimedes, killed by a Roman soldier when the Romans took Syracuse in 211 BCE during the Second Punic War. Although it is tempting to blame the Romans for allegedly putting an end to this flowering, one must remember that the school in Alexandria lasted into the fourth century CE yet never again produced work comparable to that of Archimedes and Apollonius. The ponderous Euclidean methods themselves, with their limited stock of curves, limit what can be achieved. Further advances had to wait some 1,800 years for cross-fertilization with the more graceful methods of algebra in the work of Descartes on analytic geometry in the seventeenth century CE.

Nevertheless, the last 800 years of Greco-Roman mathematics contain much that is interesting, both in the Euclidean tradition and in work better adapted for practical application. This second style of mathematics is easily distinguished from the Euclidean style by the assignment of specific numbers to represent the length of a line. Examples of this style occur in two treatises of the second-century Alexandrian Claudius Ptolemy, one on astronomy (his *Syntaxis*, now known as the *Almagest*), the other on geography.

Except for some algebraic work by Diophantus of Alexandria (dates uncertain, but probably third century CE), later Roman mathematics consists of commentaries on the earlier work. Especially notable is the *Synagoge (Collection)* of Pappus of Alexandria (fourth century), which preserves a great deal of earlier work and contains a few important original propositions.

Pythagoras

“... those called Pythagoreans took hold of mathematics and were the first to advance that study . . . since they saw the attributes and ratios of musical scales in numbers and other things seemed to be made in the likeness of numbers in their entire nature, and numbers seemed to be primary in all nature, they supposed the elements of numbers to be the elements of all things that are.”

Source

Aristotle, *Metaphysics* 1.5 985b23–986a2, translated by Richard McKirahan, in *Readings in Ancient Greek Philosophy from Thales to Aristotle*, edited by S. Marc Cohen, Patricia Curd, and C. D. C. Reeve (Indianapolis: Hackett, 1995), 18.

Pythagoras (ca. 580–ca. 500 BCE) was born on Samos in Ionia but around 532 BCE moved to southern Italy, where he founded a religious brotherhood of Pythagoreans. The sources for Pythagoras and his followers are plagued by extraordinary difficulties, including forgeries, anachronisms, and the often fragmentary secondhand nature of the evidence. He himself was chiefly a charismatic teacher of a philosophical religion of transmigration of souls whose teachings were formed in sayings called *acousmata*. Followers performed rituals and lived a life of discipline that included dietary restrictions. Later Pythagorean thought was often anachronistically attributed to him. What is clear is that he did not see mathematics as separable from metaphysics or ethics. Pythagoras’s fundamental discovery was that of numerical proportions. For Pythagoreans, reality is basically mathematical: numbers and other mathematical things provide limits for the unlimited stuff(s) of the world. (The unchanging permanent nature of Pythagorean mathematics perhaps led Plato to his Forms.) The limits are bonded to the unlimited stuffs via harmonies. In music, for example,

Pythagoras recognized the mathematical relationship between the length of a vibrating string, a column of air, or the size of a percussion instrument, and notes of the musical scale. From *Theoricum opus musicae disciplinae*, 1480. (Jupiterimages)

➤ PYTHAGORAS IN LEGEND

There are two versions of Pythagoras: the historical figure and the legend.

About the historical figure we have few reliable facts, but we know that he was a charismatic religious figure and reportedly had a golden thigh, could be in two places at once, and once conversed with a river. Later, his Pythagorean followers attributed to him many discoveries and theories, including several mathematical discoveries as well as the most important elements of Platonic and Aristotelian philosophy. Sorting the facts from the fiction is nearly impossible. And thus at the very beginnings of Western science, we find mysticism, ritual, and puzzling enigmas.

—Jacques Bailly

Pythagoras or his followers discovered the diatonic, harmonic, and enharmonic scales, which are mathematical structures (limits) harmonized with notes (unlimited).

Pythagoras’s most important followers were Philolaus of Croton (ca. 470–ca. 385 BCE), who wrote the first Pythagorean work, and Archytus of Tarentum (fl. 350–400 BCE). Among Pythagorean discoveries are the Pythagorean theorem, the incommensurability of a square’s side and diagonal, and Archytas’s method of doubling the volume of a given cube. Archytas also first identified the four branches of inquiry that became

the quadrivium of later education: arithmetic, music, geometry, and astronomy. He argued that the universe is infinite, as follows: if it is finite, then imagine standing at the edge and hold out a staff; the staff must extend beyond the supposed edge and thus identify a new supposed edge; go there and hold out a staff; repeat *ad infinitum*. Philolaus, whom Copernicus acknowledged, posited that the center of the world is neither the sun nor the earth but instead is a central cosmic fire. In general, Pythagoreans combined empirical observation with a priori thought, as is evident from the fact that their theories were not just religious beliefs but were also intended to account for observable phenomena. Because it caused turbulence in their religious beliefs about numbers, the Pythagoreans were quite disturbed by the discovery of irrational numbers: for instance, that the ratio of the side of a square to its diagonal are irrational (not representable by a fraction with whole numbers as denominator and numerator). They tried mightily to represent irrational numbers using whole numbers.

The members of the religious brotherhood of Pythagoreans were bound by a code of secrecy (which contributed to the conflicting incompleteness of what survives). Believing in the transmigration of souls, the religion incorporated intellectual activity into its rituals, which aimed at purifying the soul to attain union with the divine in part via a numerology that has been characterized as mystical. Many of their ideas are puzzling, such as a statement that jus-

tice is or resembles four and square or that one must not eat beans.

Archimedes

Mathematicians and historians of mathematics have traditionally regarded Archimedes as the greatest of the ancient mathematicians. The justification for this high esteem can be found in ten of his works, which have been preserved to the present time. They show that he was a master of the Euclidean style in geometry, proving very profound propositions with strict rigor. At the same time, both the subjects he studied and the methods he employed went far beyond what was done by his predecessors. His *Quadrature of the Parabola* is an example of the Euclidean style, while his *Method* provides an entirely different, more intuitive approach to geometry. In both of these works he came right up to the threshold of the integral calculus, which was not fully developed for another 1,800 years. (Nor could it have been, since it depends on the combination of algebra and geometry known as analytic geometry.)

➤ PRAYER BOOK OR MATHEMATICAL STUDY?

This palimpsest containing works of Archimedes was discovered in Constantinople a century ago, when it was photographed and published. Its whereabouts from 1908 to 1998, when it was auctioned by Christie's, is something of a mystery. It is actually a thirteenth-century prayer book written over a tenth-century manuscript of several of Archimedes' works. Among those works was the *Method*, which revealed that Archimedes had used some intuitive principles later known as the method of indivisibles, or Cavalieri's principle.

—Roger Cooke

(Rick Maiman/Sygma/Corbis)

Archimedes was born circa 287 BCE and spent most of his life on the island of Sicily. Plutarch says that Archimedes belonged to the ruling family in Syracuse, and some of his works were addressed to King Hieron II and his son Gelon. Archimedes probably studied in Alexandria, since he was in correspondence with other scholars there. Some of the letters he wrote to accompany his papers have been preserved. They enable us to know him better than we know most other ancient mathematicians, whose lives and works have been preserved only in secondary sources. Several ancient authors mention him and report stories about him that have become legends. Some of the feats he was said to have performed when Syracuse was under siege by the Romans during the Second Punic War border on the miraculous, such as setting ships afire with burning mirrors or building a crane to lift Roman ships out of the water. Such tales must be regarded with extreme skepticism. It is well established, however, that he was killed by a Roman soldier when the Romans finally took Syracuse in 211 BCE. (Plutarch gives three different versions of the details.) The Roman orator Cicero reported finding Archimedes' tomb 150 years later when he was quaestor in Sicily.

The ten surviving works of Archimedes are beautifully polished specimens of mathematical exposition. His proof that the area of a sphere is four times the area of a disk of the same radius meets the highest standards of Euclidean rigor, but

Archimedes went on to reveal the intuitive considerations that led him to make this discovery. In addition to the solution of such difficult problems as finding the area of a sphere and the area of a segment of a parabola, Archimedes worked on physical problems. He formulated the basic principle of hydrostatics, that the buoyant force exerted by a fluid on an immersed or floating body equals the weight of the fluid displaced by the body. He stated the law of the lever, that bodies balance at distances from a fulcrum inversely proportional to their weights. And he did not shrink from purely practical computational problems. For example, he demonstrated rigorously that the ratio of the circumference of a circle to its diameter (the number we now denote π) lies between $3 + 10/71$ and $3 + 1/7$. In his famous *Sand-Reckoner*, he found a way to cope with numbers larger than the traditional Greek system of numeration could handle and illustrated his notation by expressing the number of grains of sand required to fill up the celestial sphere (in our terms, a sphere whose radius is that of the earth's orbit).

■ Introduction: Understanding the Body

The foundations of current medical practice lie in the period from 1000 BCE to 300 CE. Prior to this, medical knowledge was relatively limited. The Egyptians and Mesopotamians had a fairly good understanding of anatomy and did practice various types of surgery. For the most part, however, ancient Near Eastern medicine relied on incantations and various types of magical remedies to heal the individual because disease was usually understood to be caused by troublesome spirits (such as demons) or by the will of the deities.

Greek medical practices departed from this by taking a more empirical approach to the understanding of disease and illness. Arguably the most influential of these empirical-based understandings of the body was Hippocrates's conception of the body as consisting of four humors (black bile, yellow bile, phlegm, and blood). Every body was made up of these humors, and most illnesses were understood to reflect an imbalance in proportion of these humors. Divinities could still be called in for assistance for the ill. Asclepius, the god associated with medicine,

was one of the most important divine beings for intervention in human health. The ill could make pilgrimages to one of his sanctuaries, where his priests would perform healing rituals.

Indian and Chinese medical practices both integrated a particular cosmological sense of the world with medical practice. Both cultures believed that various elements that became out of balance could seriously harm the individual. Through combinations of spiritual practices and medical procedures (such as surgery), Chinese and Indian medical practitioners attempted to heal the unwell. The principles uncovered in ancient India and China are, in many cases, still foundational for traditional medicine in both of these regions today.

—Kevin M. McGeough

Greek and Roman Medicine

At first associated with magic, the art of healing over time became a religious art under the protection of the god Asclepius (the son of Apollo and father of Panacea, the goddess who cures all diseases, and of Hygea, the goddess of health). Medical sanctuaries were situated near springs, the most famous in Greece at Epidaurus. The development of the spice trade as a consequence of Alexander the Great's Asian expeditions en-

riched the pharmacopoeia thanks to the introduction of saffron, cinnamon, or coriander.

The most famous schools of medicine were those of Asia, but anyone who wanted to study medicine could also become apprenticed to a qualified doctor, although such studies were not subject to official control. Some doctors had private practices in city surgeries, while others traveled the country. Medicine and religion were intimately linked in healing sanctuaries, where priest and doctor might be one and the same person. Healing took place under the protection of a divinity. Once cured, the patient would show his thanks by dedicating a votive offering (an *ex-voto*) of wood, stone, or metal that represented the part of the body that had been unwell. These very realistic *ex-votos* enable us to recognize different complaints.

An Etruscan medicine based on magic and divination was already practiced at Rome, but the Romans imported the Greek cult of Asclepius and domesticated it as that of Aesculapius. Judging by the evidence of grave stones, a number of practitioners in Rome were slaves or emancipated slaves of Greek origin. Roman doctors were respected for their skills: there were surgeons who practiced minor operations and dedicated specialists who could cure eye diseases and even operate on cataracts. The eye specialist's medical chest was full and included such features as plant-based liquid eye drops and salts diluted with milk, oil, or egg white. To identify the eye drops, the doctor would put the name of the product and the infection to be cured on the preparation by means of a stone seal. On the sarcophagus of Sosias (in the Museo Nazionale, Ravenna) we can see a woman's eyes being treated by an ophthalmologist.

The tradition of thermal baths had a long history in the ancient world. Romans already knew of the therapeutic properties of certain springs. Many would go to Cumae or Baiae to take various kinds of cures: bathing in water or mud, taking shower baths, or taking the waters in a glass. Patients thought nothing of traveling to thermal springs in Britain, such as Bath, or to Gaul, where there were such important hydrotherapy centers as Vichy and Nérès-les-Bains.

Private doctors were also attached to gladiator schools, to circus factions, and to gymnasia. Galen, the greatest Roman doctor (born in Per-

Medical instruments and eye doctor's stamp, bronze, second century BCE–second century CE, Gallo-Roman, from Vertillum, France. (The Art Archive/Archaeological Museum Châtillon-sur-Seine/Gianni Dagli Orti)

gamum in 131 CE), learned his profession on gladiators, studying anatomy before becoming doctor to Marcus Aurelius. Galen's theories were to last for 13 centuries.

Vedic Medicine of Ancient India

Ayurvedic or Ayurvedic medicine originated in the Vedic culture. The term “Ayurvedic” comes from the Sanskrit *ayur* (life) and *veda* (knowledge as truth). Thus, a literal translation would be “the truth of life.”

Our main source of knowledge of Vedic medicine comes from the *Vedas*, which are ancient texts that are difficult to date. They include sacred texts (*Sambhitas*) from the Vedic period, theological commentaries (*Brahmanas*), and philosophic supplements (*Upanishads*). One of these sacred texts (*Atharvaveda*) comprises magico-religious formulas (*atharvan*), which show archaic medical practices. In these texts disease is considered a consequence of sin, which is caused by devils. Healing involves prayer and penance (associated with magic rituals) and the use of other remedies, such as medicinal plants. Knowledge of the human body is very limited, but some knowledge concerning the functions and significance of bile, phlegm, and breath is suggested.

The historical origins of Ayurvedic medicine are very difficult to establish since the sources provide mythical accounts involving gods and legendary figures. The most concrete evidence for the early history of these medical practices comes from collections of medical texts. The oldest ones are the large collections *Susrutasambhita*, *Carakasambhita*, and *Bhelasambhita* attributed to Susruta, Caraka, and Bhela, respectively. These were historical personages who became semilegendary figures in the Vedic tradition. These collec-

YUNANI MEDICINE

Less well known than the Ayurvedic system, Yunani medicine is another classic Indian medical system that continues to thrive. The name refers to the Arabic word for Greece, “Al Yunaan.” The doctrine is composed of Arabized ancient Greek medicine, received mainly from the book *Al-Qanun fil-Tibb* (*Canon medicinae* in Latin) of the Persian physician Avicenna (980–1037). The Yunani medical doctrine is based on the four humors: *safr*a (yellow bile), *dam* (blood), *sauda* (black bile), and *balgham* (phlegm). The alteration of these humors causes disease. To treat such imbalances, doctors administer diets, herbal remedies, and in some cases bloodletting.

—Justo Hernandez

tions were written in the first century BCE but were enriched and elaborated during the following eight centuries. They have been commented upon and systematized many times since their original composition.

Ayurvedic medical theory posits that the universe is composed of five elements (*dhātu*): ether, air, water, earth, and fire. Three of them play a fundamental role in the health and diseases of the microcosmos (which are conceptualized as an organism). So, air embodies the breath (*prana*), fire the bile (*pitta*), and water the phlegm (*kapha*). Each one of these elements has specific qualities (for instance, *prana* is dry, cold, light, clear, and raw) and is divided into five varieties residing in different somatic zones. So, variations of *prana* are the source of the following organic functions: the articulated word, breathing, digestion, bodily excretions, and the movement of blood. Diseases depend on the imbalance or relative predominance of the elements, which are transformed in *dosha* (disturbed elements).

The *Carakasambhita* collection of medical texts deals with 80 diseases related to *prana*, 40 related to *pitta*, and 20 related to *kapha*. The main causes of disease (as understood in this collection) are environmental factors, dietary factors, and divine punishment. The texts do offer clinical and epidemiological observations and reflect knowledge of the precise difference between tumor and abscess, the furunculosis, the sweet urine in diabetes, and the mosquitoes of

the genus *Anopheles* as vectors of malaria. Surgery seems to have been highly advanced. The *Susrutasambita* collection mentions medical instruments, which include several types of scalpels, forceps, probes, cauteries, vaginal and rectal specula, and otoscopes. For anesthetics, substances such as opium and *Cannabis sativa* were used, as was hypnotism. Surgical operations are described in the collection of texts attributed to Susrata, such as laparotomy (surgery on the abdominal cavity), rhinoplasty (surgery of the nose), and cheiloplasty (surgery on the lips).

Early Trepanation

Trepanation (trephination) is the process of making an opening in the living human skull and has been performed in many cultures throughout recorded history. The procedure derives its name from the Greek *trypanon*, or rounded bore hole. The reasons for performing this procedure vary widely among cultures and were often bound to specific cultural, spiritual, and healing beliefs. Perhaps the best way to approach the topic of why this procedure was performed would be to accept that there was a rational justification that balanced spiritual and mystical beliefs with pragmatic treatment for traumatic injuries. In order to truly understand the meaning of this we must have an understanding of the role of the healer, the patient, the process, and its outcomes and

how they were intricately interwoven with a unique society and its beliefs. This is not a simple task, since the procedure spans a wide geographic area and virtually all of recorded history. For example, skulls showing signs of trepanation have been identified in Europe, Africa, New Guinea, Tahiti, New Zealand, Asia, and North and South America and have been dated (skulls found along the Dnieper River) to the Mesolithic period, 12,000 years ago.

Trepanning the skull most likely incorporated both mystical and practical reasons for seeking access to either the healer or the spiritual leader. For example, the belief that a person had been possessed by a malevolent spirit or perhaps had been cursed by someone wishing them harm may have led either the patient or the patient's family group to seek a solution. Although we must avoid the temptation to apply present-day societal norms while interpreting beliefs and motivations of other cultures in other times, it may be reasonable to assume that the decision to undergo a dramatic and painful procedure was not taken lightly. This would probably have included not only the patient but possibly the family and members of an extended social group. Disorders such as extreme mental illness, epilepsy, migraine headache, and various types of infections that affect the brain and central nervous system would be interpreted within the context of the group's beliefs. Traumatic injury would also have been a justification for seeking treatment.

Most often, the procedure would have been used to treat a traumatic injury. In fact, most of the trepanned skulls in some regions showed an apparent traumatic injury (with adjacent trepanation) on the left side of the skull, suggesting that most of these injuries would have come at close quarters by predominantly right-handed individuals. Reasons that did not include obvious injury include severe head pain caused by infections, tumors, or perhaps severe migraine headache. Another reason would have been seizures or bizarre behaviors associated with severe mental illness. To the patient's family or the group, this suggested the need for mystical or possibly surgical intervention. Sometimes these behaviors were attributed to a special ability to communicate with the spirit world or to mystical forces that threatened the individual or community.

There were four basic techniques of opening the skull. These were (1) scraping; (2) creating an elongated groove; (3) boring a hole with a drill or a circle of smaller close or partially overlapping holes, possibly using a chisel to open between these bore holes; and (4) four intersecting incisions that release the intervening bone fragment. The instruments would have included a stone or metal knife with a cutting and scraping edge as well as specialized trepans (identified in Mesopotamia and dating to 4000 BCE).

Among groups using sharpened stone, bone, or even metal knives, the most common tools appear to have features in common with what we consider to be modern surgical instruments. A portion of the tool served as a cutting edge that had either a pointed cutting tip, an elongated flat cutting edge, or a crescent-shaped cutting surface. There are only scattered firsthand descriptions and even rarer video excerpts of the procedure being performed. The performance of the procedure was often restricted to the healer, the patient, and one or more assistants. There is, however, evidence that the entire community may have participated in the healing ritual, which included a trepanation. Revealing these procedures to outsiders in settings where the procedure had been outlawed by a regional governmental agency made it exceedingly difficult to observe the procedure within a cultural milieu. From existing descriptions we know that the procedure frequently included the use of a sedative hypnotic substance to calm the patient, onlookers, and possibly even the healers themselves. Without considering the ritual that accompanied the procedure, the first step in performing the trepanation would require the separation of the skin of the scalp. The scalp is richly vascular, and the separation of skin layers with the division of a tough underlying connective tissue layer would have meant that bleeding would need to be slowed or stopped. The skin of the scalp may have been rolled back using leaves or substances that had a coagulant property to stop the bleeding. Once the skin had been separated and the bleeding was controlled, the outer bone of the skull was now visible. There is evidence that pigments or inks were used that seeped into and revealed small cracks caused by a traumatic injury. This also highlighted the sutures or irregular lines

where bones of the skull normally join. These were often avoided perhaps in the belief that these represented a form of supernatural writing on the bones themselves.

The skull consists of three layers: an outer hard bony layer, a middle spongy softer layer, and an inner bony firm layer. By combining a cutting and scraping movement with a Tumi knife (middle Chimu) or copper blades (Mochica period), each of these layers was sequentially exposed. The wound and skull surface were washed frequently during the procedure to remove bone fragments and scrapings. Upon reaching the middle layer (diploe) the procedure may have been interrupted for a period of time. Depending on the sufferer's condition, it may have been a good time to shift position, ingest additional sedative or analgesic substances, or simply rest. The procedure may have been ended at this point; however, there is evidence that many procedures continued beyond this point. After the inner table of the skull bone was exposed, the process of cutting and scraping continued until the inner table of bone had been removed and the rubbery covering of the brain, the dura, lay exposed. This type of approach usually resulted in a smaller inner hole with gently sloping edges forming a shallow depression. The Dolem (primarily women) in central France used a unique T-shaped Sincipital groove following the midline of the skull and may have used a hot stick or rod to burn (cauterize) bleeding vessels in the scalp. At this point the procedure would have been essentially completed, and the process of closing the wound would be undertaken. The edges of the skin were approximated, possibly sutured or loosely fastened, and the wound was covered using combinations of leaves and vines and sometimes woven textiles, stone, metal, or fragments of gourd. This entire process may have taken hours to complete. Only time would then determine whether the release of a malevolent spirit or any other desired goal of the treatment had been achieved or if the patient would have needed to undergo additional procedures or treatments.

Contrary to our expectation that the trepanation procedure would, under those conditions, have been uniformly fatal, there is evidence that patients not only recovered from the procedure but had undergone additional and occasionally many more trepanation procedures. Skulls have

been identified that show clear signs of bone formation (healing) around the edges of trepanned openings. Skulls from the Yantyo tribe in Peru show healing in more than half of the trepanned skulls examined. One Incan skull showed evidence of up to seven bore holes. Several skulls show more than one procedure and show signs of healing at different ages, suggesting that the procedure was performed several times over an extended period of time. Given the rate of bone formation and the number of openings, the procedures may have spanned years. What ultimately caused the deaths of these individuals may have had very little to do with the trepanation procedure itself. Several skulls that showed evidence of multiple procedures show healing in some but not all openings, which suggests that the patients had undergone treatments up until their deaths. The Greek literature refers to an ominous darkening or reddening of the bone, which suggests inflammation and death of the bone called osteomyelitis. This is characterized by an irregular surface around the trepanation site in some of the examined skulls. Relatively re-

cent observations of how patients have undergone the procedure demonstrate dramatic hypertrophic scars where the procedure had taken place. These scars, sometimes referred to as keloids, appear as large bulging masses of skin bordering the trepanation site and actually served to provide substantial protection for the brain underlying the section of skull bone that had been removed. Occasionally, fragments of bone that were removed following trauma or rounded portion of bone removed by cutting between smaller holes (rondelles) may have been worn by the patient or healer as an amulet.

■ Introduction: Understanding Human Action

Many historians see the Greeks as the first history writers. Although the Greeks were not the first to record events that took place or to keep track of people who ruled (the Mesopotamians and Egyptians both started doing this much earlier), the Greeks are often considered to be the first historians who attempted to understand human actions without divine explanations. It is true that there is a fundamental difference between the type of history that Homer produced and the type of history that Thucydides produced. While both discussed wars that were important to Greek culture (the Trojan and Persian wars, respectively), Homer's explanation of the causes of the war are almost entirely based on divine intervention, whereas Thucydides' explanations are almost solely based on the activities of men. This was an important intellectual breakthrough,

and one that is apparent in this encyclopedia, whereby there are no divine explanations given to understand world history.

Although the histories written by the Greeks has been incredibly important, the Greeks were not the only people from 1000 BCE to 300 CE who attempted to understand human behavior, culture, and history through writing. The authors of the Bible attempted to understand the course of history. This is especially true of the Old Testament/Hebrew Bible in which the authors of some of the biblical books attempted to understand why various bad things happened to the people of Israel despite the fact that they were the chosen people of God. The New Testament provides a historical account in a more Greek fashion, providing in many instances (such as the book of Acts and arguably the Gospels) a relatively straightforward account of the

major events in the life of Jesus and the early Church. Of course, what is not typical of Greek historians in these accounts is the discussion of miracles and direct interventions of God.

Chinese historical writing also attempted to unearth certain patterns of behavior. Prior to 1000 BCE, the idea of the mandate of heaven came to play an important role in understanding the course of Chinese history. This mandate was a mandate that the gods gave kings to rule that could be withdrawn if the human king did not live up to the deities' expectations. This understanding was incorporated into further historical reflections and contributed to the creation of a pattern or framework for understanding Chinese political history. This pattern could be described as an undulating wave, with power oscillating between a strong central authority and a number of diffused decentralized powers.

—Kevin M. McGeough

Development of Greek and Latin History Writing

Prose history developed late among the Greeks, who viewed epics as a record of their past supplemented by local traditions and stories and by their own genealogies. Herodotus of Halicarnassus, called the father of history, gave the genre its name, for *historia* means “investigation” or “researches.” In the mid-fifth century BCE Herodotus traveled throughout the eastern Mediterranean. Moved by the same spirit of inquiry that prompted the first natural philosophers, he may have intended to write of the customs and monuments of the Egyptians, Scythians, or other peoples as earlier logographers (story writers) such as Hecataeus had done.

Herodotus unified his material by relating the struggle between the Greeks and the Persians. The Persian Wars (490–479 BCE) are the culmination of a narrative that gradually introduces all the players in their native places. Herodotus found both focus and method of presentation in another famous narrative of a great war, Homer's *Iliad*; it was natural for him and his successors to incorporate dialogue, public discourse, geography, and ethnography

Statue of seated man said to be Herodotus, third century BCE, Musée de Louvre, Paris. (Library of Congress)

into their histories, which all centered around foreign wars and domestic politics of the states involved.

Many ancient historians wrote of events contemporary with their lives and those of older living people and investigated as a modern journalist does by examining locations and questioning witnesses. Thucydides of Athens lived through and recounted the history of the Peloponnesian War (431–404 BCE). He established a more critical and rigorous methodology, including the quotation of official documents, and created a sensible chronological framework for the narrative; his narrow focus on the war embraced all that war involves, including its effect on the human spirit.

Most of Thucydides' successors fell short of his standards; two centuries later Polybius

➤ EARLY HISTORIANS ON THE IMPORTANCE OF THEIR CRAFT

In his brief preface to his *Histories* (of the Persian wars), written in the fifth century BCE, Herodotus notes:

“Herodotus of Halicarnassus here sets forth his researches, so that human accomplishments not fade with time, and that great and astonishing achievements of both Greeks and barbarians be remembered, especially the reason why they went to war with each other.”

The second-century BCE historian Polybius, in the introduction to his own *Histories*, wrote the following to explain his purpose in writing a history of Rome’s involvement in the Mediterranean world:

“Who is so thoughtless or so lazy that he has no desire to know how and under what kind of government the Romans in just about fifty-three years brought into their power almost the whole inhabited world, an unparalleled accomplishment, and who is so mad to see or learn other things that he would consider them more profitable than the study of history?” (*Histories* 1.1.5–6.)

—Barbara Saylor-Rodgers

Source

Both passages translated by author from the original Greek.

revived the scientific approach to history. Polybius, a Greek, documented the rise of Rome and the decline of important Greek states. The first Roman historians, such as Fabius Pictor, followed Greek models and wrote Greek prose, while others told the same stories in dramatized Latin epics. The Roman statesman Cato, Polybius’s contemporary, wrote the first prose history in Latin.

Standard Roman methodology was annalistic due the nature of Roman civic and religious records, but in the 40s BCE Sallust wrote monographs on important episodes in Roman history. Livy composed a monumental history from the founding of Rome until his own lifetime (he died in 17 CE) that included the wars, politics, and personalities of the creation of the Roman empire. Later Romans such as Tacitus (first century CE) and Ammianus Marcellinus (fourth century CE) took up the narrative, arranging events reign by reign so that the history of imperial Rome was very much like an extended biography of each emperor.

Writing about Foreign Lands

In writing about foreign lands, most historians and commentators of antiquity presented “the other” as barbarian in relation to their own societies, which they presumed were civilized. This is most notable in the cases of classical Greece, the Hellenistic kingdoms, Rome, and Han China. Most of the rhetoric describing so-called barbarians was typically made in contextual comparison with how these civilizations viewed themselves as relatively more sophisticated and developed. Barbarians were viewed as lacking in the ways of government, culture, and even demeanor. Initially, much of the contact that these ancient civilizations had with barbarians was through trade and military skirmishes in the frontiers. Historians, military commanders, and political leaders, who wrote the bulk of this literature, wrote of these people in an effort to document their contact and exposure to “the other” on the fringes of civilization.

As the Greeks expanded their dominions in various settlements beginning in the eighth century BCE, they developed a notion of a common identity as Greeks based on language, religion, and political structures (i.e., the *poleis*). Greek writers, such as Herodotus, writing in the context of the Persian Wars, exalted Greek virtues in comparison with Persian flaws, thereby illustrating this conceptualization of Greek superiority. In this sense, foreign lands were compared with Greece and were lacking in culture, arts, and political organization and were thus barbarian. Therefore, a barbarian was conceptualized as an uncultured and uncivilized non-Greek who had no conception of Greek freedom and no appreciation for culture or the arts and lived under despotism. Greek writings on foreigners, such as those by the historian Herodotus and the dramatists Aeschylus and Euripides as well as the depictions of foreign peoples in arts, illustrate the dichotomy between the cultivated Greeks and the uncouth barbarians. Greek mythologization of their identity made room for some peoples to exist as nonbarbarians, such as the Egyptians, given their contributions to Greek learning and civilization. During Alexander's conquests of the fourth century BCE, these worldviews were carried by Greek soldiers, viewing their enemies (and their allies the Macedonians) as barbarians being brought under the mantle of Greek rule. Alexander's successor Hellenistic rulers would see themselves as the beacon of civilization ruling over barbarian peoples, who sought to be civilized.

Roman conceptualizations of barbarians were similar to that of the Greeks in that people on the fringes of the Roman realms were considered barbarians. However, not all foreigners were barbarians, as Greeks and others who were perceived to have some level of civilization were not characterized in the same manner. Contact with barbarians was primarily through trade and military skirmishes on the Roman western and northern frontiers from the first century BCE well until the demise of the empire in the fifth century CE. Through the writings of Tacitus and Julius Caesar, the Germans of Germania were presented as lacking in traits attributed to the Romans and were thus uncivilized, while some of their military capabilities might have been somewhat ad-

➤ THE BARBARIAN IN LANGUAGE—SUBJECTIVITY THROUGH DISCOURSE

The dichotomy of civilization and barbarism existed in antiquity in the discourse of the Greeks, the Romans, and the Chinese. The Greek conceptualization of barbarian was manifested in the word *barbar*, which meant “strange” or “foreign” but also “to speak nonsense” (otherwise not speak Greek). The Roman word for “barbarian,” *barbarus*, which meant “uncivilized” or “savage,” also meant “the bearded one,” something deemed as unseemly in Roman society. The Chinese concept of *hu*, used to denote barbarians, also delineated similar characteristics on non-Chinese as the Greek and Roman meanings. In this manner, elements perceived as negative traits within these ancient civilizations (speaking nonvernacular languages, being slovenly, and having facial hair) were associated with barbarians in their respective discourses.

—Abraham O. Mendoza

mirable. The lack of political order, economic structures, and religion were deemed examples of German inferiority vis-à-vis the Romans.

Ancient China, particularly under the Han dynasty of the third century CE, regarded nomadic invaders from the north, such as the Xiongnu, Tatars, and Turkic peoples, as barbarians. These nomadic peoples who plagued the northern and western frontiers of China through military excursions and raids were deemed a major threat to the stability of the Han realm (hence the importance of the building of the Great Wall). Similar to the Greeks and the Romans, the Chinese conceptualization of the barbarian was that of a stranger or foreigner lacking in characteristics that the Chinese deemed as a mark of civility within their own society. However, the Chinese also deemed Europeans, Japanese, and other Asians as barbarians, even if they exhibited a semblance of civilization (as the Chinese qualified it), as they were not Chinese and therefore were foreign. Chinese writing on foreigners presented them as exotic and lacking in sophistication akin to that associated with Han Chinese culture and society.

The Development of Chinese Historical Writing

The Chinese have the longest continuous tradition of historical writing in the world. From the Han dynasty that began in 202 BCE until the twentieth century, each dynasty wrote an official history of its predecessor. These 26 “Standard Histories” total some 40 million words. The first, *Records of the Grand Historian* by Sima Qian (ca. 90 BCE), was a groundbreaking achievement, but Sima had several previous examples to draw upon.

The earliest records in China, dating back to about 1200 BCE, were oracle bones, shoulder blades or turtle shells inscribed with questions to the ancestors about droughts, illnesses, warfare, childbirth, and so on. The bones were heated, and the resulting cracks were interpreted as yes or no answers. After the predicted events had transpired, a notation was often made on the bones. This type of dated record

gave way to the annals of individual Chinese states in the Spring and Autumn period (770–476 BCE). Indeed, the name of the period is derived from the most famous of these chronicles, the *Spring and Autumn Annals*, which was a record of major occurrences such as battles, deaths, and diplomatic dealings in the state of Lu. The *Annals* themselves are very sparse, with just a few words devoted to each event, and are arranged by year and season. The *Zuo Zhuan*, a lengthy commentary on the *Annals* composed in the third to second century BCE, offers much more detailed accounts. The *Annals* eventually became one of the five Confucian Classics, which also included an anthology of ancient poetry and another of political documents.

Sima Qian (ca. 145–86 BCE), a court astrologer and historian in the early Han dynasty, had access to these and other records (including several collections of historical anecdotes). He created a new type of universal history, one that tried to encompass the entire world, which he considered to be China and its nomadic neighbors, from legendary times to his own era. To accommodate such a vast scope, he organized his material into five sections: 12 basic annals that recounted the reigns of earlier dynasties and individual emperors, 10 chronological tables, 8 monographs on topics such as rituals or the economy, and 70 memoirs of either individuals or groups. In all, there were 130 chapters, each of which was written on a bundle of thin bamboo strips. The *Records of the Grand Historian* was the first history of China written by an identifiable author. Later dynastic histories followed the pattern established by Sima Qian with some modifications, the most important of which was that they narrowed their focus to single dynasties.

—Grant Hardy

DOCUMENTING THE RIGHTEOUS

“[Those who are righteous are praised in their own times,] but their deeds should also be written on bamboo and silk, inscribed on bronze and stone, and incised onto vessels in order to pass them down to later generations.”

—Mozi (468–376 BCE), a Chinese philosopher

■ Introduction: Technological Developments

Around 1200 BCE, the Iron Age is said to have begun in the Near East, although iron had actually first been used before this. What is markedly different about the Iron Age is the widespread use of iron in place of bronze. The manufacture of iron was one technological invention that led to a number of other technological discoveries. By 1000 BCE (although the start of the Iron Age is dated earlier), smiths were able to manipulate iron to make very strong tools. These tools had military ramifications in that stronger weapons and armor could be produced, a technological breakthrough that would not be surpassed militarily until the invention of gunpowder. Iron also allowed for better stonework, as the harder iron could be better used for quarrying and working hard rocks. Farming implements made of iron lasted longer and could be used in harder soil.

There were a variety of developments in agriculture beyond the manufacture of iron. The invention of the *karez* system in central Asia allowed arid regions to be cultivated. The same was true of the Andes, where new water systems transformed Peruvian ways of life. The Romans studied farming and adapted new farming techniques throughout their widespread empire. Associated with farming were the technologies for the production of textiles. New drawlooms in China allowed sophisticated fabrics to be made, and a felt-manufacturing industry developed in central Asia.

New construction technologies also appeared. The cities of Mesoamerica benefited from the ability to work stone and move heavy objects vast distances. The fact that stonework was so prevalent in Mesoamerican construction has meant that many of these ancient cities have survived in an environment where wooden structures would decay significantly. During the Qin and Han dynasties in China some of the most impressive monuments in the ancient world were built, most notably the Great Wall of China. The most impressive builders, however, had to have been the Romans, who left their mark wherever they went. The combination of the arch and concrete (neither of which they invented but

both of which they mastered the use of) allowed them to build on a massive scale with materials that still stand today.

Development of Iron Technology in Nok Nigeria

Nok culture is the name given to the earliest known iron-making polity in Africa south of the Sahara Desert. Its name derives from the village where its artifacts were first accidentally discovered during a tin-mining excavation in 1928. The settlements and artifacts discovered at Nok, Zaria, Abuja, Kafanchan, Jema'a, Ankiring, and other areas in the central part of Nigeria are collectively referred to as the Nok culture. The archaeological evidence reveals that actual metalworking in the forms of smelting furnaces, iron slag, and manufactures in iron and tin were practiced in these areas long ago. The period was radiocarbon dated to be between 1000 BCE and 200 CE, with most of the artifacts clustered within the period 500–200 BCE.

Some of the artifacts found in Nok include naturalistic and nonnaturalistic figures and heads, some with elongated ears; ground stone axes; iron axes and other iron tools; the baked clay draft pipe used in iron smelting; quartz lip plugs and other ornaments; and, most importantly, the striking terra-cotta.

In terms of the historical evolution of the Nok culture, the origin of the ancient Nok iron technology is still subject to debate among scholars. For instance, it has been suggested that the knowledge of iron metallurgy came to West Africa either from the metal traders of Meroe around the Middle Nile or from the North African Berber states. The Meroe refugees were said to have drifted to the West African region soon after the people of Aksum destroyed their kingdom. Thus, these Meroe refugees were credited with the diffusion of the knowledge of iron metallurgy. The second probable area of diffusion of iron technology into Nigeria was Carthage via Gao in North Africa and across the Sahara

Desert. Furthermore, there is even the widespread claim by the local inhabitants of Nok that the knowledge of iron working was indigenous to them. Nevertheless, it is apparent that the final word is yet to be said on the origin of iron technology in Nok.

It is interesting to note that artifacts from Nok were produced from alluvial tin works that included artifacts of both stone and iron. The inference is that the period of the Nok culture represented a time change and an overlap between the use of stone and iron. While it cannot be said categorically that iron technology spread only from Nok to other parts of the country, scholars can say that it was the most important single source of iron technology diffusion within Nigeria. The Nok culture had a great influence on Ife bronze culture and other culture areas in Nigeria. Indeed, it has been established through archaeological evidence that the Nok culture is the earliest known iron technology not only in West Africa but also in the whole of sub-Saharan Africa.

Celtic Metalwork

Two historic periods in Celtic Europe were the Hallstatt and La Tène. Hallstatt is the name given to a late Bronze and early Iron Age culture that was predominant in central Europe for 200 years from about the eighth century BCE. The name is derived from the location near Salzburg, Austria, at which large quantities of objects typical of the period were discovered. Some of the earliest evidence of the Celtic people comes from this time.

During this stage, bronze work became more sophisticated, incorporating items worked from flat sheet as well as those that were cast

into their final form. The use of silver and iron increased. Some articles had embossed gold decorations. The geometric decorative motifs found from this period may have been the result of contact with the classical world. It was a time of great technical improvements in metalworking, which the Celts would take with them as they conquered new lands.

Hallstatt was followed by the La Tène period, named for an excavated site on the shores of Lake Neuchâtel, Switzerland. It encompassed the late Iron Age Celts and was roughly contemporaneous with ancient Greece. The La Tène period is considered by some to be the high point of Celtic culture, lasting from around 500 BCE to the Roman invasions in the first century CE. It is at this time that the Celtic people begin to use a silver coinage system based on those of the Greeks and Romans.

This is the first period with significant evidence of lost wax casting in western Europe. Previously, they had used mostly bivalve ceramic molds, possibly due to lack of domesticated honeybees. Lavish display pieces included colorful elements such as semiprecious stones and coral. A kind of red enamel that was held in place with cold connections rather than by fusing to the metal was also used. Thin gold foil and filigree were affixed to the surface of prestigious objects. In addition to personal decorative objects, metalworkers of the period produced mirrors, hanging bowls, and vessels for domestic use. In the middle of the first millennium BCE the Celtic regions of Ireland, Scotland, northern Britain, and Wales experienced the Iron Age. Iron was produced in significant quantities to make it available to most levels of society. In addition to swords and weapons, iron implements for the planting and reaping of grains, as well as axes and saws, can be found from this period.

The decorative style of La Tène was dominated by symmetrical spiral and circular geometric designs that were interlaced. Abstracted plants and animals were also arranged into stylized designs on heavily decorated surfaces. The La Tène period influenced medieval art in the few remaining Celtic areas of northwestern Europe.

In general, Celtic metalwork is best known for its geometric design motifs that frequently included stylized beasts, people, and floral ele-

ments within them. The layout for designs was planned on grids drawn on bone or slate prior to working in metal. The circular motifs were planned with compasses. These elements were initially shallow but became deeper over time.

The technical abilities of the ancient Celts included engraving, casting, etching, and overlays of thin metal cladding in bronze and gold. Coral, glass paste, shell, niello, and amber were used for color. They also plated with tin, gold, bronze, and a silver and copper alloy. Plating and inlaid materials seem to have been particularly used to create contrasting surfaces. The glass used was probably not true enamel but rather a glass paste that was pushed into recesses after being softened by heat. The glass was mixed with cuprous oxide to give it an opaque red color. Patterns in chasing and repoussé in bronze and brass were found on shield bosses and scabbards. Small pieces in relief were created in large quantities through an embossing system.

As a primarily warring society, the early Celts reserved most of their technology for armor and arms. Bronze was used for most weapons and tools prior to the rise of iron. It was used to make hardware for leather or wooden shields, swords, scabbards, knives, daggers, and horse fittings. A few domestic objects found from this period include cauldrons, mirrors, and wooden vessels decorated or held together by bronze.

Unlike its European predecessors, Celtic culture used iron in significant quantities. By approximately 600 BCE iron was becoming a more popular metal than bronze for tools and weapons. Early iron mimicked bronze forms at first.

Celtic graves show swords and wagon fittings in iron created for wealthy patrons. Having control of proficient blacksmiths was a mark of affluence and power and the nobility gave gifts of metalwork to show their status. Weapon makers frequently signed their best work. It is probable that smiths outside the system of royal patronage existed to make simpler utilitarian objects and tools. Blacksmiths also made firedogs and chains for cauldrons. Advancements in iron-working technologies underpinned many advances in the Celtic civilizations.

Periodically, bronze and iron were combined. One way of connecting iron and bronze

➤ CELTIC HANGING BOWLS

Some of the great mysteries of the Celtic people are the hanging bowls that they have left behind. It is not known what these were used for. Dating from the fifth to the eleventh centuries, they were made of beaten copper-based alloys. These bowls appear to have been suspended from three or four hooks. Mounts for the hooks, called escutcheons, were located outside and below the rim. They were decorated with openwork, enamel, or cast into the forms of creatures, and soldered or riveted on. Some bowls may have been polished on a lathe.

The objects that survive from the ancient Celtic people are primarily functional. Their geometric motifs continue to be popular to this day and were notably incorporated into the silver and pewter of Archibald Knox in the nineteenth century.

—Ana M. Lopez

was to physically cast the metal with the lower melting temperature, bronze, around the metal with the higher melting temperature, iron. This technique, called casting on, was especially found in horse and vehicle hardware. Items have also been found in which the iron object was heated and dipped in molten bronze in order to plate the iron. Bronze and iron were used together in some La Tène cauldrons for improved durability. Bronze was also inlaid into some iron weapons as an embellishment.

Development of Iron and Bronze Technology in Yayoi Japan

The Jomon era (ca. 14,000–300 BCE) inhabitants of Japan made their tools and weapons out of stone, bone, and wood; they did not have the knowledge of how to produce metal. Metallurgy came to the Japanese Archipelago during the Yayoi period (ca. 900 BCE–300 CE) with immigrants from the Asian continent.

For functional tools and weapons such as swords, halberds, axes, and sickles, the Yayoi used iron. The earliest iron tools are from sites in northern Kyushu. While recent radiocarbon determinations date these artifacts to circa 800 BCE, some archaeologists disagree with the date. The main disagreement arises from the fact that there is a paucity of contemporary iron artifacts from the Korean peninsula and China. Another

early iron tool has come from the Initial Yayoi site of Magarita on Kyushu, though the context of the find is also debated by archaeologists.

Scholars debate how widespread iron use was during the Yayoi period. One school of thought argues that iron was readily available throughout the Yayoi period but due to its value was heavily recycled. The other school of thought argues that since iron had to be imported from either China or Korea, it was a rare item and was used only by elites. Evidence backing their view is a 1980 study on the number of excavated iron artifacts from Yayoi contexts. Northern Kyushu yielded 663 iron artifacts, with 524 of them being from a Late Yayoi (ca. 100–300 CE) context. The Kinai region of Honshu yielded only 79 iron artifacts dating to the Yayoi period.

Bronze artifacts, particularly ceremonial items, are much more plentiful. The earliest bronze artifacts appeared in the Early Yayoi period and are Korean-style mirrors, bells (*dotaku*), halberds, spearheads, and swords. Later Western Han, Eastern Han, and post-Han mirrors from China were brought to the Japanese Archipelago. The Yayoi people also imitated these styles of mirrors. As time progressed, the traditional Korean forms gave way to new styles that were less functional and more symbolic. In the case of the bronze halberds, swords, and spearheads, they became larger in size, and their blades became thinner and wider. These oversized weapons would have broken quite easily if used in combat. The *dotaku* became several times larger, with linear relief decorations and knobs along the edges.

The majority of the Yayoi bronzes have not been excavated from settlement sites. Hoards and tombs are the most common places where bronzes are found. Hoards in Japan are deposits of bronzes buried on dry land. They can consist of as few as 1 bronze item or over 300, as in the case of the Kojindani hoard in Shimane prefecture. While not exclusive, there is a general patterning in the Yayoi hoards. *Dotaku* are found primarily in Kinai, the eastern Inland Sea region, and eastern Shikoku. Weapons are found primarily in Kyushu, western Shikoku, and the western Inland Sea. The interpretation of this patterning is complicated by mixed hoards containing both

Bronze bell, or *dotaku*, from the Japanese Yayoi period, about 200 BCE–200 CE. (Sakamoto Photo Research Laboratory/Corbis)

weapons and bells in both regions and the discovery of dotaku molds in Kyushu.

Like the hoards found in Europe, the purposes and functions of the Japanese hoards are also debated by archaeologists. Makoto Sahara has argued that bronzes were cultic objects and were normally stored in the ground. When the cult was abandoned, the bronze remained in the ground. Hideji Harunari has argued that the bronze artifacts were viewed as magical and were used as territorial boundary markers. A more general explanation is that they were hidden away in times of warfare and forgotten about.

While it is clear that the Yayoi people were able to manufacture items from bronze and iron, there is no evidence that they were able to smelt iron and copper and produce bronze from locally available materials. The process of extracting copper and iron from its ores produces massive amounts of waste material known as slag. So far, the oldest slag heaps found in the Japanese Archipelago date to the later half of the Kofun period. At Enjo, north of Kyoto, archaeologists have found evidence of iron smelting that dates to the fifth century CE. In the case of bronze, lead isotope analyses indicate that the bronze used in the dotaku and other Yayoi bronze artifacts originated either in China or the Korean peninsula. It implies that the Yayoi either recycled bronze objects from these two areas or directly imported bronze ingots from these two areas. Lead isotope analyses point to the earliest exploitation of copper ores in the Japanese Archipelago in the eighth century CE.

➤ BRONZE SMELTING IN ANCIENT ASIA

Bronze is an alloy consisting primarily of copper and tin and, in the case of East Asia, some lead. Copper can be smelted from a variety of copper-bearing minerals, and tin comes from the mineral cassiterite. In copper and tin smelting, the furnace operates at a temperature high enough to melt the resulting product. Lead is added to bronze to lower its melting point so that it stays a liquid longer when making elaborate castings.

Iron is smelted from a variety of iron ores. Iron smelting can be done one of two ways. In a bloomery furnace, a carbon monoxide atmosphere is created, and the heat and carbon monoxide reduce the iron oxides to iron. What is important to remember in the bloomery process is that the iron never melts; the gangue forms a liquid above 1,200°C and is squeezed out of the bloom by repeated hammering. An alternative way of producing iron is by using a blast furnace. The blast furnace operates at temperatures over 1,500°C, and the iron is melted as it is produced. The resulting product is called cast iron.

Nomadic groups are believed to have brought the bloomery process to China circa 700 BCE. The Chinese developed the blast furnace circa 500 BCE. The few metallographic studies of Yayoi iron indicate that both cast iron and bloomery iron were in use during the Yayoi period.

Chinese Innovations in Farming and the Geographic Sciences

Pre-Imperial China, and the Eastern Zhou era in particular, will probably always be best known for the rise and fall of its feudal political structure and its cultural and intellectual efflorescence. There were, however, several quite astounding technological and scientific innovations during this period. Interestingly and ironically enough, many of them date to the fourth century BCE, a time during the Eastern Zhou called the "Warring States," when warfare between states had reached its most intense level.

One supremely important innovation in pre-Imperial China was the trace harness. This invention, which dates to the fourth century BCE,

➤ JOSEPH NEEDHAM'S *SCIENCE AND CIVILISATION IN CHINA*

Only during the past few decades have Western scholars begun to realize just how advanced pre-modern Chinese technology and science really were. (“Pre-modern China” refers to China before 1840 or so.) The late great British China specialist Joseph Needham and his team of researchers at Cambridge University worked on the history of Chinese technology and science since the 1950s. Together they produced a monumental, multivolume work entitled *Science and Civilisation in China*, a project that is still ongoing despite Needham’s death. In this continuing work, Needham and others have presented a bewildering array of overwhelming evidence showing that pre-modern China was quite advanced in engineering, agriculture, industry, medicine, warfare, transportation, mathematics, and the physical sciences. The results of their research prove conclusively that many inventions, discoveries, and innovations long thought to have been accomplished by Europeans actually originated in China several hundred years before they were known in the West.

—David Curtis Wright

revolutionized agriculture. Prior to the advent of the trace harness, farm animals that pulled plows were harnessed around their necks and stomachs with something called a throat-and-girth harness. This was, of course, inefficient and cruel because it choked the poor beast when it pulled any significant burden. There is evidence that in the fourth century BCE, the Chinese began placing a yoke across the animal’s chest, from which traces or shafts connected it to a carriage. This simple and ingenious innovation placed the burden not on the neck of the animal but on the chest, which was much more able to withstand the strain of pulling loads. Astonishingly, this simple innovation was unknown in the ancient Middle East or the Roman empire, and it did not emerge in medieval Europe until the eighth century CE, about nine hundred years after it was first used in China.

By the sixth century BCE, at the very latest, the Chinese were using iron plows. Chinese de-

signs of the plow included a remarkably efficient one that used a plowshare to cut the soil and a moldboard to turn the soil over as the plow was pulled forward. This type of plow, which was finally introduced into Europe during the seventeenth century, contributed greatly to the European agricultural revolution. By the third century BCE, the Chinese also understood the importance of planting crops in long, straight lines. Plants placed in straight lines usually do not interfere with each other’s growth and allow winds to pass through without causing extensive crop damage. Straight-line cropping was not widely practiced in Europe until well into the eighteenth century CE.

Other innovations in ancient Chinese geology involved the utilization of energy sources. By the fourth century BCE the Chinese were drilling for natural gas and using it as a heat source, thus preceding Western natural gas drilling efforts by about 2,300 years. Natural gas seems to have been discovered accidentally by workers who were drilling in the earth for brine, or water saturated with salt from salt deposits in the earth’s crust. When they found both brine and natural gas together, the ingenious and practical Chinese used the natural gas to boil vats of the brine, thus removing the water and leaving the salt behind. Some drilled wells yielded only natural gas, and the Chinese called these “fire wells.” Later innovations facilitated the transport of natural gas through bamboo pipelines and even the use of portable tanks to carry it.

Another technology that is fundamental to the practice of geography today that has its roots in ancient China is the compass. Both the Europeans and the Chinese seem to have made the first use of the compass in navigation during the twelfth century CE, but the Europeans obtained the compass itself from China, where it had been known since the fourth century BCE. The compasses used in twelfth-century navigation involved the use of magnetized needles, but the earliest Chinese versions of the compass seem to have been spoons or other objects fashioned from naturally magnetic lodestone. The earliest mention of a simple lodestone compass occurs in a fourth-century BCE Chinese source, but a more detailed description dates to the *Han Feizi* (*Master Han Fei*), the third-century BCE work

on Legalism. The Chinese term for compass is “south-pointer” or “south-pointing needle” because the ancient Chinese thought of south, not north, as the cardinal direction.

The Camel Saddle

The domestication of the camel was crucial to the opening of the desert for trade and travel. Nonetheless, taming the animal did not complete the camel's transformation into a useful animal. Due to the camel's unique physiology, it is not the easiest animal to ride or carry heavy loads over a long distance. Whereas the horse offers a stable platform for rider and load, the camel's hump or humps was a considerable obstacle. In order to use the camel to its maximum potential, a saddle was necessary. There are three places where one can place a saddle on a camel: on top of the hump, behind the hump, and in front of the hump. Not surprisingly, geographic diversity led to a wide range of saddle styles and placement.

Although the camel's domestication dates to roughly 3000–2500 BCE in Arabia, the camel saddle does not appear until sometime between 500 and 100 BCE in North Arabia. The earliest depiction of it is found on Roman coins in the first century BCE. However, there is little reason to doubt that it was in use by the Nabateans and Bedouin tribes prior to this. Indeed, Bedouin probably first invented the saddle out of necessity to survive the desert, as it allowed them to carry more possessions and, most importantly, more water. The North Arabian saddle became the most common form of saddle used in the Middle East, although other varieties came into being as well.

THE CAMEL SADDLE AND WAR

One of the most important advantages of the North Arabian saddle was that it provided a stable platform for its rider. This was crucial not only for long-distance transportation but also in transforming the camel into an effective animal in war.

With the dispersal of the North Arabian saddle with its inherent stability, new forms of weapons were introduced to other regions of Arabia. The adoption of the northern variant of the saddle allowed for the use of long lances in mounted combat in Yemen. Previously this was not used or was used infrequently, as a rider on the South Arabian saddle could topple from the saddle by the impact of his lance against an enemy due to the saddle's instability. The North Arabian saddle also benefited the rider by providing a height advantage, which compensated for the camel's inferiority to a horse in combat.

By mastering mounted combat on camelback, Bedouin tribes then became a crucial factor in the trade routes. Rather than simply being camel breeders and customers, the Bedouin could now give caravans a simple choice. The caravans could either use them as guards or risk being attacked by the Bedouin. Their riding skills were also superior to those of sedentary guards. Thus, they could attack and ride off into the desert and make a clean getaway. The requisitioning of Bedouin guards became essential simply because one could not take a sizable body of cavalry on horseback into the desert due to water requirements.

—Timothy May

The saddle itself both accommodates rider and secures baggage, as it is a frame that works around the dromedary camel's hump. Both saddle bows are comprised of straight sticks that form a V-shape or lopsided X, with the intersection of the V serving as the bow. These sit on pads so as not to chafe or irritate the camel. The bows are connected by sticks or framework on the side of the camel, with the hump protruding above it all. The riders sit upon a pad atop the hump more or less in the middle of the camel; however, the rider's weight is distributed to the framework and to the camel's ribcage. If the camel was used to carry baggage, the load must be divided into two equal portions and tied to

the side of the saddle. If the load is not properly distributed, it will cause undue stress to both the camel and the saddle.

Although the North Arabian saddle became the most common form, the South Arabian saddle is older in design, dating to the ninth century BCE. The major difference is that the saddle bows were closer to the hump, and the whole apparatus sat on top of a cushion on the camel's hump, with the rider more toward the back of the camel. Although the South Arabian saddle is still in use today, the North Arabian style also became ubiquitous in Yemen. The primary reason seems to have been that the North Arabian style simply provided a more stable platform than the South Arabian saddle.

Other saddles also existed in North Africa. The Tuareg in the region of the South Sahara desert placed the saddle in front of the hump. The advantage here is that it provided more control over the camel, as the rider was closer to the camel's head and neck. Furthermore, the rider could also control the camel with his feet and toes, thus leaving his hands free for other activities. These saddles are more chairlike in appearance than most, with a high back and a small bow in the front, and they sit squarely on the shoulders of the camel. In between the Tuaregs and Arabia are a wide variety of saddles with their positioning on the camel slightly different. Nonetheless, scholars believe that the North African or Saharan forms of the saddle ultimately are derived from the North Arabian saddle, as saddles closer to Arabia bear a close resemblance to the North Arabian saddle and gradually transform into one similar to the Tuareg version. This is supported by petroglyphs found in the Sahara. Other forms, specifically for baggage, are baskets hung on either side of the hump without any sort of wooden frame.

The Bactrian camel represented a new challenge due to its multiple humps. It is not certain when saddles came into use for the Bactrian camel, but it was definitely in use by the time of the Northern Wei dynasty (386–534 CE). This saddle was made with felt padding surrounding the camel's humps and then two boards or bundles of sticks on the side. Additional felt helped strap the boards or bundles to the camel's body, connecting the sides by running between the

humps. Typically the Bactrian camel was a beast of burden, and thus the main concern was attaching bundles to the saddle. A rider could of course ride on top of the saddle, sitting between the humps.

Roman Concrete

The Romans originally learned the art of building from the Etruscans, who in turn had been taught partially by the Greeks of south Italy; it is not surprising, then, that their early buildings in Italy resembled those of both cultures. The first revolutionary phase of Roman architecture occurred with the conquest of the eastern Mediterranean in the last two centuries BCE, when Romans adopted the classical and Hellenistic Greek forms, replacing the broad, squarish, and top-heavy Italian proportions with the oblong, tall, and airy Greek style. But their real contribution to civil engineering was structural concrete.

Concrete, though not an invention of the Romans, was perfected by them about 200 BCE, and by the first century it had become the principal material for foundations and walls. In order to obtain better footings for their buildings, the Romans were willing to alter the natural contours of the terrain and to sink deep and substantial footings of unfaced concrete. For the exposed walls above, the concrete, made of lime and volcanic sand with fragments of stone scattered through it, was poured semifluid into a wooden mold; when the planking was removed the wall was faced with stone or brick wherever it was to

be seen. From about 200 to 50 BCE the facing was made of small, irregular bits of stone, each with a smooth outer surface and a pyramidal tail set into the concrete (*opus incertum* meaning “irregular work”). For the next hundred years or so the facing stones were cut as squares and arranged corner-to-corner in rows to give a symmetrical appearance like the meshes of a net (hence the name, *opus reticulatum*, or “net work”). As early as the time of Augustus the concrete was being faced with kiln-dried bricks, a method (called *opus testaceum* or “brick work”) that reached its peak in the second century CE under the Emperors Trajan and Hadrian, hence the familiar brick facades of many of the surviving buildings throughout the Mediterranean constructed during the prosperity of the Roman empire. Finally, as the empire declined so, too, did methods of construction, with ever greater quantities of mortar being used between the layers of brick.

While the stone or brick facing of visible walls was not structurally necessary, the pointed ends served to bind the concrete, in fact, an early form of modern reinforced concrete. Concrete was so inexpensive and easy to use that the Romans even made columns of it: cylindrical concrete cores faced with slightly curved bricks and smoothed with liquid cement into which were set thin, prefabricated strips of fluted marble.
